The roots of sassafras very early in American history became an important article of medicine, worth three shillings a pound, and they were one of the objects for which an English expedition landed in Massachusetts in 1602. It was also called "ague tree," as a decoction of its bark was supposed to cure that disease. In American household practice, sassafras tea, an infusion of the young shoots and roots, has long been a favorite remedy for colds and a tonic, being a sudorific and stimulant. It is also an ingredient of root-beer. The bark of twigs and the pith are rich in mucilage (as are the leaves), and make a lubricant for oculists, and a yellow powder to thicken Creole gumbos, much as akra is used. The oil of sassafras is used for a perfume for soaps, etc. The wood itself is orange-colored with pale sap-wood, and when stripped of its bark resists decay for some time, while in contact with soil, so that it can be made into fence posts, although too brittle and coarse-grained for most purposes.

Australian sassafras is the name given to several large evergreen trees with aromatic barks, growing in Australia and Tasmania, namely: *Atherosperma moschata*, *Doryphora sassafras* and *Daphnandia micrantha*. Brazilian sassafras, or sassafras nut, is the pichurim bean. Swamp sassafras is the *Magnolia glauca*.
HELEN INGERSOLL.

SASSANIDÆ, sās-ān'ī-dē, a dynasty of Persian kings which succeeded that of Arassidæ in 226 A.D. The founder of the line was Ardeshir, known to the Greeks as Artaxerxes; he was the grandson of Sassan, from which fact the dynasty is named. The Persian Empire was much extended under this dynasty as the outcome of successful wars against the

Roman and Byzantine emperors. The Zoroastrian religion was brought back and maintained. The dynasty lasted until the death of Yezdegerd III in 1652. This king had been beaten by the caliph Omar in the battle of Nehavend, 10 years before, his territory having fallen into the hands of the Mohammedans. See PERSIA.

SASSARI, sās'sā-rē (also called *Sarsina*), Italy, in Sardinia. (1) capital of the province of its own name, 12 miles southeast of its port, Porte Torres. It is situated on a height 650 feet above the sea, amid orange and olive groves. It is well built and has several handsome palaces, churches, monasteries, nunneries, colleges, universities, an old citadel, a library, hospital, etc. Tobacco is the staple manufacture; trade is carried on in grain, fruits, oil, cheese and goat-skins. Commercial population about 43,118. (2) The province occupying the north part of the island, having an area of 4,122 square miles; pop. about 310,000.

SASSOFERATO, Giovanni Battista Salvi, jō-vān'nē bāt-tēs'tā sāl'vē sās-sō-fā-rā'tō, Italian painter: b. Sassoferrato, Ancona, Italy, 11 July 1605; d. Rome, 18 April 1685. He learned the elements of his art from his father, and afterward went to Rome and Naples and studied under Raphael, Domenichino, Guido and Albani. His paintings, whose subject is chiefly the 'Madonna and Child,' are filled with deep and true feeling and the coloring especially is elaborated with exquisite care, the principal scheme of his pictures including warm, luminous flesh tints, bright blue scarfs and crimson robes, harmonized with inimitable skill. He has also executed some good portraits and landscapes; his pictures are still highly esteemed and in 1858 his 'Marriage of Saint Catharine' was sold for £1,076 sterling, about \$5,880.

SASSOLITE, native boric acid, B(OH)₃, occurs in the lagoons of Tuscany and in other natural waters, from which it is derived on a large scale by evaporation. It is also found in small, pearly, white scales, and as an incrustation.

SASSULITCH, sās-sool'ich (**SASSOULITCH**, **ZASSULITCH**), Vera, Russian Nihilist: b. Russia, 1853. She was accused of complicity in a Nihilist plot in 1869 and unjustly imprisoned for many years. In 1878, indignant at the treatment inflicted on a prisoner by the Saint Petersburg chief of police, Trepoff, she armed herself with a revolver and on 5 February coolly attempted his assassination. She was tried and acquitted in April 1878. The trial was afterward declared null and void, but she disappeared and has since lived in retirement in Switzerland. Her writings were collected in two volumes and published in 1906.

SASTEAN (sās'tē-ān) **INDIANS**. See SHASTA INDIANS.

SÁTÁRA, sā-tā'rā, or **SATTARA**, India, in Bombay, (1) capital of the district of the same name, 56 miles southeast of Poona, crowns a small, steep and rocky hill, just below a strong hill fort. It consists of one long street of uniform appearance, excepting the rajah's palace, which is of modern construction. The town was formerly the chief seat of the Mahrattas. Pop. 29,601. (2) The district, covering an area of 4,825 square miles.

Much of the territory is irrigated, and the chief crops are millet, pulse, oil-seeds and sugarcane. The manufactures are cotton-cloth, blankets and brassware. Modern improvements are the Kistna Canal and irrigation works. The Southern Mahratta Railway traverses the district from north to south. Pop. about 1,200,000.

SATELITE, the trade name for a fibrous serpentine having a chatoyant effect; mined as a gem in Tulare County, Cal.

SATELLITES, in astronomy, secondary planets or moons. One satellite has been observed with Neptune; four with Uranus; Saturn has 10, Jupiter eight, Mars two and the earth one. The rings of Saturn are technically said to be composed of a great number of satellites, but these are probably exceedingly small, and are possibly not larger than particles of sand or dust.

SATIN, in textile manufacture, a closely-woven silk, in which the weft is hidden, presenting a glossy surface. In the manufacture of other silken stuffs each half of the warp is raised alternately; but in weaving satin the workman only raises the 5th, 8th or 10th part of the warp; thus the weft is hidden beneath the warp, which, presenting an even, close and smooth surface, is the more capable of reflecting the rays of light. In this way satin acquires that lustre and brilliancy which distinguish it from most other kinds of silks. Sometimes satin is made with a pile and flowered pattern and it is then termed satin-damask. A cotton imitation is called satin-sheeting. The chief seats of this branch of manufacture are Lyons in France, and Genoa and Florence in Italy. From the East Indies are imported those light stuffs called Indian or Chinese satins. They are either plain, damasked striped, open-worked or embroidered. See **SILK** AND **SILK INDUSTRY**.

SATIN-BIRD, a kind of Australian bower-bird (*Ptilonorhynchus violaceus*). The adult male is conspicuous for the satin texture of its glossy black plumage. The younger bird is at first entirely of a dull green color, which gradually becomes mottled with black, and eventually changes entirely into that hue. Long before the construction of the nest, and quite independently of it, they, with consummate skill, weave an arbor-like gallery of uncertain length (see **BOWER-BIRDS**), in which they amuse themselves with the most active glee, the male displaying himself therein to attract the hen bird. The architecture of the bower is very tasteful, and scarcely a day passes without some fresh arrangement of the shells, feathers, bones and other decorative materials, which they bring from long distances in the bush to ornament the bower and the platform on which it stands.

SATIN-FLOWER, or **SATIN-POD**, a cruciferous plant of the genus *Lunaria*, native to Europe and Asia. One of the two species (*L. rediviva*) is perennial, the other (*L. annua*) is annual or biennial, and is called "honesty." Both are pubescent, branching herbs, with mostly cordate leaves, and are cultivated not only for their four-merous, large violet flowers in terminal racemes, but for the long-stalked pods, which are more than an inch long, very flat and two-celled. The veined valves covering the seeds, which are long stemmed, soon fall off

with the seeds and leave only the partition wall between the cells. This is elliptic in shape, of parchment-like texture and shining with a silvery gleam that makes the groups interesting for decoration, and they are much sold on Paris flower-stands for this purpose.

SATIN SPAR, a fine, fibrous variety of either gypsum or calcite. These may be distinguished from each other by the effervescence of the calcite satin spar with acids and also by its superior hardness. The color is usually snowy white, sometimes flesh or salmon red. Owing to the fibrous structure, the mineral shows a beautiful satiny or pearly opalescence. It is rather extensively manufactured into cheap jewelry and ornaments. The best material for this purpose comes from England and is sold at many tourist resorts, notably Niagara Falls, near which place small quantities of inferior material occur native.

SATIN-WOOD, the product, principally of the *Chloroxylon swietenia*, of India and Ceylon. This is a small tree with large panicles of whitish flowers and deciduous, long, pinnate leaves, and can furnish a log three to six inches square. The wood is very hard, close-grained and durable and light orange in color; it takes a fine polish and when of the feathered variety is very beautiful, but liable to split. In the 18th century this ornamental wood was much in demand for handsome furniture, with scroll work, and with medallions painted upon it. It is now principally used for cabinet-work, for picture-frames, the backs of brushes and marquetry. Several other species of trees in the East and West Indies, especially the *Mabuxifolia* and *Xanthoxylum caribæum*, produce woods of similar appearance, quality and name.

SATINET, an inferior fabric, woven much thinner than ordinary satin. The name is also given to a kind of cloth woven, with cotton warp and woolen weft, to imitate satin.

SATIRE, a kind of literary composition in verse or prose, in which wickedness or folly is censured and held up to reprobation; it is a word of Latin origin and the ancient Roman poets were the inventors of the satire. From the time of Lucilius (d. 103 B.C.) till now, says Dryden, "the very name of satire is formidable to those persons who would appear to the world what they are not in themselves." Of the four princes of Roman satire — Lucilius, Horace, Persius, Juvenal — Persius (d. prematurely in the reign of Nero) is the least important. Juvenal (who appears to have produced satires in the reign of Domitian and who survived into the time of Hadrian, 117 A.D.) uses satire with consummate power and spirit, as an engine for attacking the brutalities of tyranny and the crimes, the follies and the frenzies of a degenerate society: he is confessedly the foremost satirist not only of ancient but of all times: great modern poets of all countries have translated or imitated the 16 satires of Juvenal; and he has been better translated into English than almost any other ancient poet. Horace (Augustan period) developed satire into a branch of composition peculiarly his own, and in this branch he is without a rival: he ridicules the follies of the world from the point of view of a man of the world; and though his morality does not rise above the level of a prudential moderation,

he enforces it with so much dramatic liveliness and gay humor that he has ever been the favorite poet of men of letters and epigrammatists. A totally different form of satire is the mediæval 'Reynard the Fox,' the 'Owl-glass' (*Eulenspiegel*), 'Piers Plowman'; followed in the Reformation epoch by Ulrich von Hutten's 'Epistolæ Obscurorum Virorum,' Erasmus' 'Praise of Folly,' Rabelais, 'Gargantua,' Buchanan's 'Franciscanus,' etc. In Spain, where no freedom of criticism existed, the spirit of satire took refuge in the picaresque novel, prototype of Lesage's 'Gil Blas'; Cervantes' 'Don Quixote' too might be classed as a satire were it not so much more. Most of the great dramatists of the 17th century were more or less satirists: among them Molière stands pre-eminent. Butler's 'Hudibras' is a model of unadulterated satire; and political satire is carried to perfection in Dryden's 'Absalom and Achitophel.' In France, Boileau was regarded as the modern Horace in satire and in the mock-heroic, but in both respects he was equaled or even surpassed by Pope. In Germany the most conspicuous satirists have been Hagedorn, Kästner, Wieland, Tieck, Goethe; in England in the 19th century the foremost were Byron, Hood, Hook, Jerrold, Thackeray, Carlyle; in the United States James Russell Lowell, through his 'Biglow Papers,' held rank among the foremost in political satire.

SATIRE MÉNIPPÉE (so called because it mingles prose and verse after the manner of the Menippean satires of Varro), the title of a political satire directed against the Ligue and the Spanish party and their efforts to keep Henry of Navarre from the throne of France. It parodies in telling fashion the proceedings of the States-General which had just voted (February 1593) to set aside the Salic law in order that claim to the crown might be made through the female line. It consists of two parts. The first is a sort of prologue. Two hawkers are introduced who cry most vociferously, in the approved style of the patent-medicine vendor, the wonderful virtues of the famous "catholicon d'Espagne," or Spanish panacea. Then the assembling of the States-General is described, and the hall where their sittings are to be held, with its many tapestries, each of which contains in the scene which it represents some sharp satiric thrust at the Ligue. The second and longer part gives the deliberations of the body and reports the speeches. Various chiefs of the Ligue, in burlesque harangues, in which buffoonery and coarseness abound, betray the personal ambitions, the hope of extortion and dishonest gain, the disregard of national honor, that animate them. In sharp contrast with them is the speech of the spokesman of the third estate, Claude d'Aubray, who with sober eloquence and an accent of sincere patriotism pictures the sad state of France, torn by civil strife, lays the blame at the door of the Ligue, and points the way to national unity, order and well-being in the choice of Henry IV. The 'Satire Ménippée' appeared at the beginning of 1594, though it was circulated in manuscript some months before, not, however, till the Parliament of Paris (June 1593) had declared the decision of the States-General void and upheld the Salic law.

So it came too late to play a decisive part in the struggle, but it helped strengthen the cause already won. Its good sense, sharp wit and strong national feeling delighted a very large public, and it speedily became famous. D'Aubigné expressed the general estimate when he called it "the most excellent satire of our time." But it has little of universal and permanent appeal, and the reader of to-day is not only not interested in the subject matter, but is often offended by its extreme coarseness.

The satire was the work of six men: Pierre Le Roy, a priest; Jacques Gillot, Nicolas Rapin and Pierre Pithou, men of the law; and Jean Passerat and Florent Chrestien, poets and scholars. It appeared anonymously, and the share of each contributor is not certain. But tradition generally ascribes to Le Roy the general conception and plan of the work and the composition of the first part, and to Pithou the longest and most serious piece, the speech of d'Aubray.

ARTHUR G. CANFIELD.

SATISFACTION, *in law*, the satisfying of an obligation or claim, as by performance, payment or giving an equivalent; indemnity for an injury. The doctrine of satisfaction is of importance in the interpretation of wills and also in the law of contracts. For example, if a debtor by will bequeaths to his creditor a legacy at least as great as an existing debt, such legacy is held to be a satisfaction of the debt in the absence of any circumstance rebutting this presumption. Likewise it has been held that where a person has agreed to manufacture, to the satisfaction of the buyer, an article, as an engine, in which personal taste is not directly involved, but merely mechanical utility, the buyer is bound by the contract if he has no reasonable grounds for refusing the article after its completion.

SATOLLI, sā-tōl'lē, **Francesco**, Italian ecclesiastic: b. Merciano, Perugia, 21 July 1841; d. Rome, 8 Jan. 1910. He became professor of dogmatic theology at Urban College of the Propaganda, Rome, and in 1888 was made archbishop of Lepanto. He was the papal representative at the celebration of the centenary of the establishment of the see of Baltimore in 1889, and returned to the United States in October 1892 in the capacity of appellant judge with extraordinary discretion. His action in regard to several notable Church controversies raised up a party of opposition against some of his proposed measures in ecclesiastical affairs in America. In January of the next year an order came from Rome quelling the opposition and creating Monsignor Satolli permanent American apostolic delegate. He returned to Rome in 1896 and was elevated to the cardinalate. During the Saint Louis Exposition in 1904, he again visited the United States.

SATRAPS, sā'trāps or sā'trāps, the name given the governors of provinces in the ancient Persian empire. The power of the satrap, so long as he retained the favor of his sovereign, was absolute; he levied taxes at his pleasure and aped the capricious tyranny of his master unchecked. When the monarchy of Cyrus began to decline many of the satraps threw off their allegiance, and founded independent kingdoms of their own. The term

satrap is sometimes used to signify a petty despot.

SATSUMA, sāt-soo'mā, Japan, province in the southwestern part of the island of Kiushu, now a part of the prefecture of Kagoshima. It has played an important part in the history of Japan, and before the revolution of 1868 it was one of the most powerful feudal strongholds. Its samurai ably supported the revolution which placed the Mikado in power, and readily yielded their prerogatives in order to secure a stronger nation. However, they rose in rebellion under Saigo (q.v.), in protest against the predilection of the court for instituting foreign customs in 1877; but the rebellion was put down. The province manufactures a beautiful porcelain, known as Satsuma ware.

SATSUMA WARE, a fine kind of pottery or semi-porcelain made in Japan, having a feldspathic glaze of a light straw color, the surface of which is covered with a network of fine cracks. Red and green colors and dulled gold are employed for decorating the ware. Fine old Satsuma ware is highly esteemed by collectors. See ART; JAPAN; PORCELAIN; POTTERY.

SATURATION, in meteorology. A space is said to be "saturated" with aqueous vapor when its condition is such that the temperature cannot be reduced by the smallest amount without the production of condensation. In meteorology we have to deal mainly with spaces that are filled with ordinary atmospheric air. Hence the phenomena which relate to atmospheric saturation are of the greatest practical importance. The quality of moisture that is required to saturate a given mass of air is independent of the pressure of the air, but it depends largely upon the temperature of the air. A given mass of heated air can contain a much greater quantity of moisture than the same mass can retain when cold; and the quantity of moisture that any mass of air can retain without condensation is sensibly equal to the quantity of moisture that would be required to saturate the space occupied by the air, if the air itself were absent. When a given space contains a given quantity of aqueous vapor, the temperature at which the space is precisely saturated is called the "dew-point," corresponding to the quantity of vapor that is present. If water is introduced into a closed vessel from which the air has been exhausted, a portion of it will evaporate, and the evaporation will proceed until the pressure in the vessel, due to the presence of the aqueous vapor, attains a certain definite value, which depends solely upon the temperature of the vessel and its contents. The limiting pressure (or, as it is called, the "tension of the saturated vapor") so attained at various ordinary temperatures, is given in the table following.

The condition of the air with respect to saturation is called its "hygrometric state"; and the hygrometric state is defined, so far as its numerical estimation is concerned, as the fraction that is obtained by dividing the tension (or pressure) of the vapor that is actually present, by the tension of the vapor that would be required to completely saturate the same bulk of air, at the observed temperature. The tension of the vapor that is actually present in the air

Temp. Fahr.	Tension of vapor at saturation in inches of mercury	Temp. Fahr.	Tension of vapor at saturation in inches of mercury
0°	0.044	60°	0.522
5°	0.054	65°	0.622
10°	0.068	70°	0.739
15°	0.086	75°	0.873
20°	0.108	80°	1.029
25°	0.135	85°	1.209
30°	0.167	90°	1.417
35°	0.203	95°	1.655
40°	0.248	100°	1.926
45°	0.300	105°	2.236
50°	0.362	110°	2.589
55°	0.436	115°	2.987

under given conditions may be determined by means of the "hygrometer," an instrument which is made in a great variety of forms. In Regnault's form (which is very accurate, although not well adapted to general use), a polished silver tube is placed in a vertical position, and partially filled with ether, into which a delicate thermometer dips. A current of air is then drawn up through the ether by means of an aspirator, and as the ether is gradually chilled by the consequent evaporation, there comes a time when moisture begins to condense from the air upon the polished exterior of the silver tube. The temperature of the ether is then noted by the thermometer that dips into it; and we take this temperature as the "dew-point" of the air that is in contact with the outer surface of the silver tube. By reference to the table given above, we are then able to determine, at once, the tension of the vapor that is actually present in the air; and upon dividing this by the tension of saturated vapor corresponding to the actual temperature of the air, we obtain the fraction which expresses the "hygrometric state" of the air. Suppose, for example, that the temperature of the air is 70° F., so that if it were saturated with moisture the tension of the vapor that it contains would be equal to the pressure produced by 0.739 inch of mercury. Let us further suppose that the hygrometer shows that dew is deposited upon the silver tube when the temperature falls to 50° F. We should then know that the quantity of vapor actually present in the air is sufficient to produce saturation at a temperature of 50° F.; and by reference to the table we see that this signifies that the actual tension of the vapor present in the air is the same as the pressure due to 0.362 inch of mercury. The "hygrometric state" of the air is then found by dividing 0.362 by 0.739. That is, it is 0.492.

A. D. RISTEEN, PH.D.

SATURDAY, so called from the planet Saturn, the seventh day of the week; the *Sabbath* of the Jews. It is called by the Italians *Sabbato*; by the French, *Samedi* and by the Germans, *Sonnabend* (Sunday eve), or in High German, *Samstag*, a corruption of *Sabbathstag* (Sabbath day); and in Lower Germany, *Saterdag*, of the same origin as the English.

SATURN, an ancient Italian divinity, husband of Ops and father of Picus. He was the god of seed-time and harvest and is represented as bearing a sickle. He was later identified with the Greek Chronos, who, driven from his

supreme throne by Zeus, came to Latium and set up his kingdom there. Under his reign was the Golden Age. At Rome his throne was shared by Ops, afterward identified with Rhea, and in the time of the last Tarquin a temple was built to him at the foot of the Capitol and was afterward used as the treasury (*Saturni Atrium*). The foundations of this temple and eight pillars still remain. The statue of Saturn was all year long swathed in woolen bandages excepting during his festival, the Saturnalia (q.v.), when it was uncovered to the eyes of the people.

SATURN, the sixth major planet in the order of distance from the sun. Although this planet is not quite so large as Jupiter, its grand array of rings and satellites renders it the most stupendous object in the solar system. To the naked eye, when near opposition, it shines as a bright star of the first magnitude. Its light is somewhat yellow, bearing a great resemblance to that of Arcturus, both in color and brightness. Saturn, like the other superior planets, is best seen in opposition, when it rises at sunset, and is visible almost the entire night. An opposition occurred about 12 Aug. 1904, and the times to look for it in future years may be found by the rule that it occurs about 13 days later every year than it did the year before. Its time of revolution is 29.6 years, at the end of which period it will return to opposition at the same time as at the beginning, and will present the same general aspect.

The rings of Saturn render it a beautiful and striking telescopic object. They are about 173,000 miles in external diameter, and the central opening of the ring is about 111,000 miles. This makes the breadth of the ring itself, from its inner to its outer circumference, about 31,000 miles, or more than four times the diameter of the earth.

This object was an enigma to the early observers with the telescope. Galileo correctly described it as seeming handles of the planet, a circumstance which, up to the present time, has led to their visible ends being called *ansæ*. As Saturn moved forward in its orbit these handles disappeared from view, owing to the rings being seen edgewise, a circumstance which greatly perplexed Galileo, and encouraged those of his opponents who were disposed to throw doubt on the accuracy of his observations. But the correctness of the latter was shown in a very few years by the reappearance of these seeming handles. The mystery was at last solved by Huyghens in 1656, who, after long and careful study, announced that "the planet is surrounded by a thin, plain ring, nowhere touching it, and inclined to the ecliptic."

When the rings of Saturn are carefully examined with a powerful telescope they are found to be quite complex in their make-up. Shortly after Huyghens made known the real form of the rings, Cassini, of the Paris Observatory, announced that there were really two rings separated by a fine dark line. The outer one was much narrower than the inner one. The line of separation is called the Cassini division. About 1843 Encke of Berlin announced that the outer ring was sometimes seen as if divided. Careful study of the appearance makes it probable that there is no real division here, but only a somewhat soft, dark marking round the ring.

Shortly afterward it was announced by Bond and others that there was really a third ring between the two hitherto known and the planet, which had escaped observation because it was very faint and dusky, looking somewhat like a band of crape. This dusky ring was for many years an object of much curiosity on the part of observers; but it is now found not to be a separate ring at all, but only a dark-shaded extension of the inner ring. It is now so easily seen in a good telescope that the failure of the earlier observers to see it suggests a possible change in the object. A suspicion that the inner ring at least was becoming broader and its inner edge approaching the planet, was propounded by Struve, who based his conclusions upon a comparison of drawings and measurements made from the time of Huyghens to that of Herschel. But this change is not considered as established.

The equator of Saturn and also its rings are inclined to the plane of its orbit around the sun by about 27° . As the planet moves round the sun, its axis, and hence its equator and rings, preserve the same direction in space, on the same principle that the axis of the earth keeps its direction in going round the sun. Consequently there are equinoxes and solstices for Saturn as for the earth. At the time of the Saturnian equinoxes the plane of the rings passes through the sun. There being two such equinoxes, at opposite points of the orbit, the interval between them will be half the time of revolution of Saturn, or 14.8 years. As the earth is quite near the sun compared with the distance of Saturn, the rings will be seen edgewise from the earth about the time of these equinoxes. They are then found to be so thin as to almost disappear in the most powerful telescope. The last occasion on which this occurred was in 1907; other opportunities will be offered in 1922 and 1937. At intervals intermediate between these times the rings are seen under the greatest angle, which, however, is never greater than 27° , which is their inclination to the orbit of the planet. At these times it is, at its brightest, because the rings are opened out the widest to our view.

Another perplexing question was, how these objects could be kept in place—accompanying the planet in its orbit, and always centred on it, without meeting destruction by falling upon it. A very little mathematical calculation suffices to show that two bodies of this shape ought, on the least disturbance, to be gradually attracted toward the planet on one side or the other, falling upon it as surely as a chair, balanced on one of its legs, will fall to the floor. Laplace suggested that this might be avoided by the rings being liquid and not solid. But it was found by subsequent investigation that a liquid ring would fare no better than a solid one. Professor Benjamin Peirce suggested that the rings might be kept in place by the attraction of the satellites. But this suggestion proved no better than the others.

The mystery was at last solved by Prof. Clerk Maxwell of England, in a paper on "The Rings of Saturn," which gained the Adams prize essay from the Cambridge University. He demonstrated, by mathematical analysis, that the only objects which could permanently accompany the planet in the way

SATURN

The Planet Saturn, as drawn by Proctor, but modified to take account of the extension of the Dasky Ring observed at Washington, 1901

the rings did would be a cloud of small satellites, possibly particles no larger than pebbles. A suggestion of this fact had been made more than a century before by Cassini, but little notice had been taken of it. This announcement made it of great interest to discover whether any other proof could be found for such a view. One consequence of Maxwell's theory is that the rings cannot all revolve together like a solid body, but that the inner portions must revolve more rapidly than the outer ones, the rate of revolution, in every part of the ring, being that appropriate to a satellite in that position. As the particles forming the rings were separately invisible, there was no way of deciding by telescopic observations whether they followed this law of revolution.

It was reserved for Keeler, at the Allegheny Observatory, by the use of the spectroscope, to demonstrate Maxwell's theory by observation. Bringing Saturn and its rings in such a position that they should fall across the slit of his spectroscope, only a single line of light penetrating the slit, it was found that, after being refracted by the prism, the dark lines of the spectrum were not straight, but were broken exactly in a way to indicate that the inner portions of the ring revolved more rapidly than the outer ones.

Saturn is surrounded by a retinue of 10 satellites, more than surround any other planet, their distances having a wide range, as will be seen by the table below:

NAME	Dist. from Saturn in radii of planet	Periodic time	Discoverer and date
Mimas.....	3.1	0 d. 23 h.	W. Herschel in 1789
Enceladus.....	4.0	1 d. 9 h.	W. Herschel in 1789
Tethys.....	5.0	1 d. 21 h.	Cassini in 1684
Dione.....	6.3	2 d. 18 h.	Cassini in 1684
Rhea.....	8.9	4 d. 12 h.	Cassini in 1672
Titan.....	20.5	15 d. 23 h.	Huyghens in 1655
Themis.....	24.8	20 d. 20 h.	W. H. Pickering in 1903
Hyperion.....	25.1	21 d. 7 h.	Bond in 1848
Japetus.....	59.6	79 d. 8 h.	Cassini in 1671
Phœbe.....	213.5	546 d. 12 h.	W. H. Pickering in 1901

Phœbe and Themis were discovered at the Harvard Observatory, by photographs of stars surrounding Saturn. The motion of the former is retrograde, while that of the remaining nine satellites is direct.

The largest and brightest of these objects is Titan, which may be seen in a telescope of moderate size. The faintest (except Themis and Phœbe), is Hyperion, which requires a large telescope to show it. Mimas also is a difficult object to see; but a telescope of three or four inches' aperture will commonly show several besides Titan. The Astronomical Ephemeris gives the apparent orbits and data for each year by which the visible satellites can be readily identified. One difficulty in doing this arises from the small stars which are frequently seen in the neighborhood of the planet.

Japetus, the outer satellite, has the singular peculiarity of being much brighter at the western than at the eastern elongation. The variation of brightness goes on with such regularity that it can be attributed only to one cause—the satellite is darker in color on one side than on the other, and revolves on its axis in the same time that it goes round the planet, thus always presenting the same face to the latter, as the moon does to the earth. A peculiarity of

Japetus, Themis and Phœbe is that the plane of their orbits deviate from the planes of all the other orbits. One of the curious features of the Saturnian system is that the rings of the orbits of the six inner satellites all lie in the plane of the planet's equator. It is known that the planes are thus kept together by the mutual action of all these bodies, combined with the attraction of the equatorial protuberance of Saturn itself.

It will be seen from the distances given in the above table that the satellites are divisible into several groups. The five nearest the planet follow each other at fairly regular and not wide intervals. But the sixth, Titan, is more than twice as far as the one next within it. Themis and Hyperion are only a little outside of Titan, and move in very eccentric orbits. There is a curious action between these bodies, in consequence of which three revolutions of Hyperion are almost exactly equal to four of Titan; and the motions of the two satellites are so timed that they come into conjunction only at the point where Hyperion is farthest from the planet. These conjunctions occur at intervals of 65 days, during which Titan will have made four revolutions and Hyperion three.

This and other relations which exist between the motions of the satellites have the result that their mutual attractions upon each other give rise to curious results in making first one and then another swing back and forth in their orbits. The mathematical problems thus arising tax the abilities of the ablest investigators of the motions of these bodies.

Physical Constitution and Rotation of Saturn.—The physical constitution of Saturn would seem to be quite similar to that of Jupiter; but the former, being nearly twice as far as the latter, is more faintly illuminated by the sun, and more difficult of observation. Careful telescopic observations show that Saturn has a slightly mottled or cloudy appearance; but the mottling is so faint that it is impossible to locate any one feature, so as to follow it from hour to hour. It is, therefore, as a general rule, impossible to see the rotation of the planet. But on three occasions since the telescope has been used in observing Saturn, a spot or region of unusual brightness has been formed upon its disc which enabled its time of revolution to be observed. The first of these was in the time of the elder Herschel; the second in 1876, when the planet was carefully observed by Professor Hall; and the third in 1903, when a spot was discovered by Barnard and observed by many astronomers. On the second occasion it was found that the spot gradually spread out, the brightest point being near one end, while it gradually faded out at the other end. In consequence of this, it was impossible to fix the period of rotation with entire exactness, because it would depend upon whether we took the brightest part of the belt into which the spot was stretched, or the middle of the belt, as the point of comparison. The results of the time of revolution on the three occasions, so far as worked out, are as follows:

Herschel.....	10 h. 16 m.
Hall.....	10 h. 14 m.
Barnard.....	10 h. 38 m.

Very remarkable is the deviation of the last period from the two others. It is easy to

determine what this means. The white spots observed by Herschel and Hall were on or near the planet's equator, while Barnard's spot of 1903 was in middle latitude. We therefore conclude that Saturn is like Jupiter and the sun, in that its equatorial portions rotate in a less period than those nearer the poles.

Saturn also resembles Jupiter in its very small density, which is even less than that of water. We therefore reach the same conclusion as in the case of Jupiter—that the outer visible surface of this planet is probably gaseous; that the planet, in fact, is a ball of vapor surrounding a comparatively dense nucleus.

SIMON NEWCOMB.

Revised by ERIC DOOLITTLE.

SATURNALIA, the name of a Roman festival, instituted, according to the popular belief of the ancients, in commemoration of the happy period under the reign of Saturn, when freedom and equality prevailed, and violence and oppression were unknown. It originated probably as a harvest celebration. The festival continued at first one day; then three; afterward five; and finally, under the Cæsars, seven days, namely, from the 17th to the 23d of December. At the commencement of this festival a great number of wax tapers were lighted in the temple of Saturn, as a sign that no more human victims were to be sacrificed. During its continuance no public business could be transacted, the law courts were closed, the schools kept holiday, to commence war was impious and to punish a malefactor involved pollution. The slaves were freed from restraint, wore caps as badges of freedom and went about dressed in tunics, adorned with purple, and in white togas. Masters and slaves changed places; and while the servants sat and banqueted at the tables, they were waited on by their masters and their guests, who, if they did not do this, were obliged to submit to all sorts of ridiculous punishments. Jests and freedom everywhere prevailed; and all ceased from their various occupations.

SATURNIAN VERSE, a metre employed by the earlier Roman poets. It consists of two members; the first an iambic dimeter catalectic, the other a trochaic dimeter brachy-catalectic. It points to the transition from the accentual versification of Etruria and Latium to the quantitative verse of fully developed Roman literature modeled as this latter was on Greek usage. It was originally employed in the hymns to Saturn sung at harvest time, hence its name; and it is also found in extant fragments of Nævius, Livius Andronicus, Ennius, etc. The basis of the metre is thus shown:

— — — — — | — — — — — |

which corresponds with the metre of the old jingle,

There was a man in our town | wondrous wise and cunning.

The metre is met with in all primitive forms of European poetry, whether Spanish, German, or Anglo-Saxon, and is the underlying measure for almost all ballad literature.

SATYRS, *sāt'ers* or *sāt'ers*, in Greek mythology, a race of woodland divinities, who were followers of Dionysus (Bacchus), and represent the luxuriant vital powers of nature.

They are not mentioned by Homer, but Hesiod describes them as a worthless race, unfit for work. They were supposed to be the sons of Hermes (Mercury) and Iphthima, or of Silenus. They appear in early works of art and poetry as robust in human frame with bristly hair, broad snub-noses, ears large and pointed like those of animals, two little horny knobs on their foreheads and a tail like that of a horse or goat. They are described as being fond of wine (whence they frequently appear with a wine cup or a thyrsus in their hands), and of every kind of sensual gratification, whence they are often represented sleeping, playing musical instruments, or engaged in voluptuous dances with nymphs. Like all the forest and field deities, they were greatly dreaded by mortals. By later writers, especially the Roman poets, the satyrs are confounded with the Italian Fauns, and are accordingly represented with larger horns and goats' feet, although they were originally quite a distinct class of beings. Ancient sculptors were fond of representing the satyr whether in his coarser or finer type—one of the most famous specimens of Greek art being the Satyr of Praxiteles, in which the revolting animal features of the conception have disappeared, and the satyr is portrayed as a beautiful and graceful youth.

SAUCONITE, a zinc-bearing clay from mines at Friedensville, Pa.

SAUERKRAUT, *sow'r'krowt*, a salted preparation of cabbage, much esteemed by German and other northern European people, and of which large quantities are prepared for winter use. The common white cabbages are taken when they have formed firm hearts; these are sliced into small pieces and packed in layers in a cask with culinary salt, a few juniper berries and caraway-seeds or cloves being added according to taste, the whole mass being packed down as hard as possible without crushing the slices and covered with a lid pressed down with weights. Partial fermentation sets in after some time, and the watery juice rises to the surface. This juice is poured off, and water containing a solution of salt is poured in and changed till it rises without a scum and a fetid smell. The cabbage is then fit for use, and is stored in a cool place in the barrels still under pressure. It may be eaten boiled in the same way as fresh cabbage, or stewed with bacon or salted meat.

SAUGER, or **SAND-PIKE**, a fish of the rivers and lakes of the northern Mississippi Valley, a pike-perch of the genus *Stizostedion*, and hence a relative of the wall-eyed pike. The sauger (*S. canadense*) is much smaller than the wall-eyed pike, seldom more than 18 inches long and one to two pounds in weight. It varies in quality and estimation both as food and as a game fish, but in some tributaries of the upper Mississippi affords good sport by trolling over ripples with a minnow. Its color is olive gray, the sides grassy or orange with dark mottlings, round black spots on the dorsal fins and a large black blotch on the base of the pectoral fin.

SAUGERTIES, *sā'gër-tīz*, N. Y., village in Ulster County, on the Hudson River at the mouth of Esopus Creek, and on the West Shore Railroad, about 12 miles north of Kingston. A

ferry connects Saugerties with the New York Central and Hudson River Railroad at Tivoli, on the opposite side of the Hudson, and there are regular steamer communications with all the Hudson River ports. It is in an agricultural region, and has good water power for manufacturing. In the vicinity are bluestone and limestone quarries. The chief industrial establishments are factories for making writing-paper, blank-books, envelopes, cardboard and coated paper for lithographing purposes, and the pulp mills. There are also brick works and quarries, and a white-lead factory close by. The manufacturing and export products of Saugerties and the nearby villages are shipped mainly from Saugerties by water. The educational institutions are a high school, the public and parish schools and the Y. M. C. A. library and reading-room. There are several banks. The government is vested in a president and board of trustees. Pop. 4,485.

SAUGUS, sâ'gûs, Mass., town in Essex County, on Lynn Harbor and Saugus River, and on the Boston and Maine Railroad, about four miles west of Lynn and 10 miles northeast of Boston. Within its corporate limits are the villages of East Saugus and Cliftondale. It is a residential section with several manufacturing establishments, chief of which are woolen mills, and boot and shoe factories. The town has a high school and graded elementary schools. Pop. 8,047.

SAUL, first king of Israel from about 1040 B.C. He was the son of a Kish, a wealthy and powerful Benjamite, was noted for his personal beauty and courage; and when the people became dissatisfied with the theocratico-republican constitution, was selected by Samuel for their king. He was not acknowledged by the whole people until after he had gained a victory over the Ammonites. Repeated successes over the Philistines, Edomites, Moabites, Ammonites, and even over a king beyond the Euphrates, confirmed his authority. But Samuel, offended by the encroachments of the king on the privileges of the priesthood, and by his disobedience to the commands of Jehovah in a war against the Amalekites, secretly anointed David as king. His reign was terminated by a catastrophe. A battle was fought against the Philistines at Mount Gilboa; the Hebrews fled, Jonathan and two other sons of Saul fell and the king slew himself with his own sword. David, whose skill in poetry equalled his musical genius, honored in a touching elegy the memory of his fallen friends and foes (2 Samuel i), who, "lovely and pleasant in their lives, were even in their death not divided; they were swifter than eagles, they were stronger than lions."

SAUL. This "dramatic lyric" by Browning, one of the most popular of his poems, is founded on 1 Samuel xiv, 14-23, which tells how David by playing upon his harp exorcized the king's evil spirit. The first nine stanzas of 'Saul' were published in 1845; to these were later added seven stanzas, and the entire poem was published in 1855. Its noble and inspiring outlook on life, its profound emotional appeal, its fine imagery, its dramatic quality and the vigorous rush of its verse, place 'Saul' among the most remarkable of English

lyrical poems. David is the speaker. As he and his friends are tending their sheep in the morning, he tells the story of the night when he sang and played before Saul. He finds the king in his tent, apathetic and almost unconscious. Saul must be aroused, made to feel the joy of life, quickened to a sense of his own personal worth. First, David plays the tunes to which the wild animals respond — the quail, the crickets, the jerboa; then, the tunes associated with simple human customs, the reaping, burying, marrying and worshipping. Saul begins to respond. David then sings the joy of living, of "our manhood's prime vigor" and of Saul's great place in the world. The king's spirit is roused; but the harpist must lead him far higher. So he sings of fame after death, of the place Saul shall hold in the memory of generations yet unborn; finally, of immortality and love, and of the Christ as the living embodiment of man's highest longings. Saul is restored. As the singer hastens homeward through the night, he receives nature's own attestation of the new law of love. Much of Browning's philosophy of life is embodied in 'Saul,' which contains ideas that also find expression in others of his shorter poems, notably in 'Abt Vogler' and 'Rabbi ben Ezra.'

MARION TUCKER.

SAUL, a Biblical tragedy in five acts, by Vittorio Alfieri (1749-1803), is generally regarded as his masterpiece. It is written in blank verse, or, rather, in unrhymed hendecasyllables, broken and varied, thus avoiding the monotony of the French Alexandrine verse which the author disliked. Alfieri, as he relates in his 'Vita' (Autobiography, Epoca IV, Cap. 9), had been reading with intense interest the Bible during a quiet stay in Rome (1782-84), and had his imagination enkindled by the fierce struggle between two opposite passions in the breast of Saul. Thus the idea of the tragedy came to him on 30 March 1782; and by 30 July the play was finished. Alfieri would have dedicated Saul to Pope Pius VI (Jean-Ange Braschi), but His Holiness thought it would be unbecoming to be associated in any way with a theatrical production. ('Vita,' 1783).

The tragedy was first performed in Florence, in 1793, by amateurs, in a private house before a small audience, with good success. 'Saul' is representative of Alfieri's genius, and has had the most constant success of all his tragedies on the stage. The superb tragic elements in the Biblical story have long made it a favorite for treatment by poets, sculptors, painters and musicians — witness 'Saul le furieux' of Jean de la Taille, the 'Saul' of Voltaire, and of A. Soumet, in France, of Paul Heyse and J. G. Fischer, in Germany, and of Aaron Hill, in England, and of Charles Heavyside, in America. In extreme simplicity of structure 'Saul' is like the author's other tragedies yet is less austere, in that humanity here reveals itself more pleasingly. While Alfieri sympathized with Saul in his conflict with the priesthood, that struggle does not form the main interest of the play; nor is David, the instrument of God, at all like the tyrants who represent the opposition in most of Alfieri's tragedies, but on the contrary he grows throughout the plays in nobility, loyalty

and tenderness. Saul, a prey to conflicting emotions, perishes not because of his crimes or passions, but through remorse, intensified by the terror which has taken possession of his soul. The 'Song of David' in the third act is one of the gems of Italian lyric poetry. A useful edition of 'Saul,' well annotated, is that of Mario Menghini (Florence 1893).

JAMES GEDDES, JR.

SAULSBURY, Willard, American lawyer and legislator: b. Georgetown, Del., 17 April 1861. He was educated at the University of Virginia, and was admitted to the bar in 1882, since when he has been engaged in law practice at Wilmington, Del. He came of a family prominent in Democratic political circles in Delaware, was delegate at large from Delaware at the Democratic National conventions in 1896, 1904 and 1912. He was United States senator in 1913-19, afterward returning to private life. He consolidated the street and electric railroads of Wilmington, and is director in various banks and trust companies.

SAULT SAINTE MARIE, soo'sānt mā'ri or (Fr.) sō sānt mā-re, Canada, town and port of entry of Algoma District, Ontario, on the Saint Mary River, the Sault Sainte Marie Canal and on the Canadian Pacific and Algoma Central railways. It is connected by the international bridge, one mile long, with Sault Sainte Marie, Mich., hence with the Duluth, South Shore and Atlantic and the Minneapolis, Saint Paul and Sault Sainte Marie railways. It is in an agricultural and mining region and is a popular summer resort. In addition to the ship canal around the rapids, Sault Sainte Marie has a large power canal, which already supplies important industries and will supply power to future manufactories. The most important industry is the manufacture of wood-pulp and paper, the large mill at Sault Sainte Marie having cost in construction more than \$1,000,000 and being one of the largest in the world. There are also nickel steel works, utilizing the nickel ores from the Sudbury mines, foundry and machine shops and lumber mills. The city owns and operates its electric-lighting plant and waterworks. A new power plant is under construction. It is the seat of the Anglican bishop of Algoma and the Roman Catholic bishop of northern Canada; has good schools, banks and weekly newspapers. Pop. with Steelton adjoining, absorbed in 1917, 19,500.

SAULT SAINTE MARIE, Mich., city, port of entry, county-seat of Chippewa County, on Sainte Mary's River, near the outlet of Lake Superior, on the Sault Sainte Marie (q.v.) Ship Canal and on the Duluth, South Shore and Atlantic and the Minneapolis, Saint Paul and Saute Sainte Marie railroads. The international railroad bridge across Saint Mary's River connects the city with the city Sault Sainte Marie in Canada, thus making direct connections with the Canadian Pacific Railroad. The principal industrial products are calcium carbide and leather; other manufactories are machine shops, foundries, planing mills, woolen mill and shingle mills. It has a shipyard, large lumber yards and warehouses. Two hydro-electric plants develop approximately 5,000 horse power from the falls of the Sault Rapids. About 75,000,000 tons of freight

are passed down the Sault locks annually. The total value of imports for the fiscal year ending 30 June 1918 was \$12,934,377; while that of exports for the same period amounted to \$10,000,000. A branch of the State fish hatchery is maintained here. There are 12 churches representing the various denominations. The educational institutions are Loretto Academy, a high school, public and parish schools and private business schools. The three banks have a combined capital of \$300,000, and there are also two building and loan associations. The city's property assessment in 1918 was \$15,654,960. The locality has a romantic place in United States and Canadian history, and before the white man it must have been, from its situation, a well-known passing point on Indian trails; it is known to have been one of the favorite fishing grounds of the Chippewa Indians, and the first explorer as early as 1634 found about 2,000 natives living here. The French missionaries Rambault and Jogues visited this locality in 1641, followed by Père Menard in 1660; and a mission was established by Jacques Marquette in 1668, which, however, was abandoned 20 years later, the settlement continuing as a trading post. It was at Sault Sainte Marie that the governor-general of New France gathered a great council of Indians in 1671, and in the name of the king of France took formal and solemn possession, by proclamation, of all the country south to the Gulf of Mexico and west to the Pacific Ocean. Pop. 14,500.

SAULT SAINTE MARIE, soo sānt mā'ri, or French, sō sānt mā'rē, **SAINT MARY'S FALLS**, or the "SOO" CANALS. The early trappers and traders of the Northwest found free navigation insuperably impeded by the sault, or rapids of the Saint Mary's River, whose descent of 18 feet to the mile compelled costly portaging of the increasing cargoes of furs and merchandise. Finally, the Northwest Company, seeking to gain an advantage over its rival, the Hudson's Bay Company, constructed a canal with a single lock on the Canadian side of the Falls. This was in 1797-98, and the canal was in use by canoes and bateaux until 1814, when all but its timber floor and sills was destroyed by United States troops. No further attempts at canal building in this remote spot were made until 1853, when a ship canal—the first within the borders of the United States—was begun by the State of Michigan, to connect lakes Superior and Huron, and was finished in 1855. The length of the canal was 5,674 feet, and it was provided with two tandem locks, each being 350 feet in length and 70 feet wide, and allowing passage of vessels drawing 12 feet, the original cost being \$1,000,000. The United States government, by consent of the State, began in 1870 to enlarge the canal, and by 1881 had increased its length to 1.6 miles, its width to an average of 160 feet, and its depth to 16 feet; also had built a single lock, called the Weitzel Lock, 515 feet long and 80 feet wide, with a depth of 17 feet on the sills, which was located 100 feet south of the State and arranged for an average lift of 18 feet locks. The State relinquished all control of the canal in March 1882. In 1887 the State locks were torn down and replaced by a single lock 800 feet long, 100 feet wide and a depth of 21 feet of water on the sills. This lock, called the

SAULT SAINTE MARIE

SAULT SAINTE MARIE

1 Jack-Knife Bridge

2 Sabin Lock showing construction

"Poe" lock, built at a cost of \$3,000,000, was put in commission in 1896. The canal was also deepened to 25 feet. From 1892 to 1903 many millions of dollars were expended in laying out a new and straighter route through Hay Lake and other channels, eliminating a number of short turns and giving dredged areas over 30 miles in length. This was one of the chief causes of the reduction of the cost of the freight-ton through the canal from 13.57 mills in 1882 to 3.53 mills in 1909. A new work of great importance was begun in 1908. It consisted of the widening and deepening of the canal above the locks and in the Middle Neebish channel, and the construction of the new canal and the great Davis lock. This work was completed in 1914 at a cost of \$5,000,000, the result being that the canal is now 500 feet wide at the upper entrance, 270 feet at the basin, 108 feet at the lock gates and 1,000 feet wide at the lower entrance. The improved Middle Neebish channel is now 300 feet in width and has 22 feet of water over the rock at mean low stage level of Lake Huron. The excavations for the third or Davis lock were completed early in 1912 and allowed for a lock chamber 1,350 feet long and 80 feet wide with a minimum depth of 24 to 25 feet below extreme low water. A separate and free waterway was also constructed to feed the new locks. One result of the opening of the new lock in 1914 was that the largest sized bulk freighters, which since 1895 had been using the Canadian canal, began again to take advantage of the United States canal. (See below).

The plans adopted in 1907 were designed with a view to affording an approach also to a fourth lock, with the same dimensions as the third, and an appropriation was noted in 1912, and work on the excavations commenced soon thereafter. The lock pit was finished in the spring of 1915, the masonry work was half completed by the beginning of 1917, and the lock was opened for navigation in 1919, the cost being \$3,275,000. The great length of the third and fourth locks, 1,350 feet as compared with 1,000 feet in the Panama Canal, enables sometimes as many as five ships to go through in one lockage. As many as 125 ship passages are made in these locks in a single day. The new jack-knife bridge which spans the canal, providing means for passing over the third and fourth locks, is claimed to be the largest bascule bridge in the world. Besides the canals on the American side of the international line, the Dominion government opened a large Canadian canal in 1895. This canal is one and one-eighth miles long, 150 feet wide and 22 feet deep, with a lock 900 feet long and 60 feet wide, with 22 feet on the mitre sill. (See CANADIAN CANALS). The commerce passing through these canals which are toll-free eight months of the year is far greater than is borne by the Suez Canal, the Kiel Canal and the Manchester Canal combined in a whole year; the commerce of the Erie Canal, the Welland Canal and the canals of the Saint Lawrence may be added and the aggregate will still fall short of the tremendous tonnage passing through the "Soo" canals. It reached in 1910 a total of 62,363,218 tons—an increase of 4,468,069 over 1909. The total freight traffic passing through the United States locks in 1915

was 71,290,304 short tons, and in 1916 it totaled 92,000,000. Through the Canadian canal the freight totaled 16,816,649 tons. In 1918 the cost of operating the American canals amounted to \$120,000, averaging less than two mills per ton of freight.

SAUMAREZ, sō-mā-rā', or **SAUSMAREZ**, James, BARON DE, British naval officer: b. Saint Peter Port, Guernsey, 11 March 1757; d. there, 9 Oct. 1836. He served in the American War; was raised to the rank of commander after the engagement between the English and Dutch in 1781, and was captain of the *Russell* in the combat between Rodney and De Grasse. In 1793 he was knighted for the capture of the *Réunion*, a French frigate. In March 1795 he was appointed to the command of the *Orion*, in which ship he opened the battle of L'Orient, in which the French fleet was defeated, 23 June; he shared in the victory off Cape Saint Vincent, 14 Feb. 1797, and was second in command to Lord Nelson in the victory of the Nile, 1 Aug. 1798. In 1801 he was made rear-admiral, created a baron and appointed to the command of the squadron cruising off Cadiz. He defeated a Franco-Spanish fleet of 10 sail of the line and four frigates. At the beginning of the war with Russia (1809) he commanded the Baltic fleet. In 1821 he became vice-admiral of Great Britain, was raised to the peerage of the United Kingdom with the title of Baron de Saumarez of Saumarez, in 1831, and thenceforth lived in retirement. Consult Ross, 'Memoirs of Admiral Lord de Saumarez (1838).

SAUNDERS, sän'derz, Alvin, American legislator: b. Fleming County, Ky., 12 July 1817; d. Omaha, Neb., 1 Nov. 1899. He removed with his parents to Illinois in 1828, and at 16 went to Iowa. He studied law, was postmaster for seven years and eventually became a banker. He was a member of the convention which framed the constitution under which Iowa was admitted to statehood, was State senator for eight years and a commissioner to organize the Pacific Railroad Company. In 1861-67 he was governor of the Territory of Nebraska and during the Civil War sent 3,000 troops to the front besides repelling the attacks of the Indians, although the entire population of the Territory numbered but 30,000. He served in the United States Senate in 1877-83, was active in the movement for the resumption of specie payment, secured a labor school for the Indians on the Pawnee Reservation, obtained 600,000 acres for Nebraska by straightening its northern boundary line, and was prominent as a commissioner on Indian affairs.

SAUNDERS, Frederick, American librarian, publisher and author: b. London, England, 14 Aug. 1807; d. New York, 12 Dec. 1902. He came to the United States in 1837 and established in New York a branch of his father's publishing business, and did some earnest if unsuccessful pioneer work in the interest of an international copyright law, a project in which he had the support of Irving Bancroft, Bryant and other famous authors. He was city editor of the New York *Evening Post* for a time; and in 1859 he became assistant librarian at the Astor Library, filling the office of chief librarian in 1876-96, when he resigned. He was well known as a contributor to magazines and reviews and was author of 'Salad

for the Solitary by an Epicure' (1853); 'About Woman, Love and Marriage' (1868); 'Pastime Papers' (1885); 'Character Studies' (1894), etc.

SAUNDERS, Richard, the name under which Benjamin Franklin published his 'Poor Richard's Almanac' (1732-57).

SAUNDERS, Thomas Bailey, English author: b. Alice, Cape Colony, 2 Dec. 1860. He was educated at King's College, London, and at University College, Oxford, became a barrister in 1886 and has since engaged in literary work. He has made translations of much of the work of Schopenhauer and Goethe and has written 'Life and Letters of James McPherson' (1893); 'The Quest of Faith' (1899); 'Prof. Harnack and His Oxford Critics' (1902); 'Schopenhauer' (1901), etc.

SAUNDERS, William, Canadian agriculturist, pharmacist and entomologist: b. Devonshire, England, 16 June 1836; d. 13 Sept. 1914. He accompanied his parents to Canada in 1848 and became a manufacturing chemist at London, Ontario. Becoming extensively interested in agriculture, he made a study of soils and insect pests, and did much to further the development of scientific agriculture in Canada. He was professor of materia medica at Western University in 1882-85 and public analyst for western Ontario in 1882-86. He was one of the founders of the Ontario College of Pharmacy and served as its president for two years. In 1885, under government direction, he investigated agricultural experiment work in the United States and Europe, his report resulting in the establishment of the Canadian experiment farms, of which he was in charge in 1886-1911. He was a founder of the Ontario Entomological Society, and was one of the original fellows of the Royal Society of Canada, of which he was president in 1900. Author of 'Insects Injurious to Fruit' (1882; 2d ed., 1898).

SAUNDERS, William Lawrence, American engineer and inventor: b. Columbus, Ga., 1 Nov. 1856. He was graduated at the University of Pennsylvania in 1876, and in 1878-81 he was with the National Storage Company at Communipaw, N. J. He was afterward president of the Ingersoll-Sergeant Drill Company and an officer in other companies manufacturing tools and machinery. He invented a compressed air system of pumping liquids; a drill for use upon submerged rocks, and the Ingersoll track and bar channelers for quarrying stone. In 1915 he was appointed to the United States Naval Advisory Board and subsequently became its chairman. Author of 'Compressed Air Information' (1903); 'Compressed Air Production,' and joint author of 'Subways and Tunnels of New York; 'Rock Drillings.'

SAUREL, a fish. See SCAD.

SAURIA, sâ'rî-â, a term variously applied in the classification of the reptiles, but in this work restricted to designate the subclass composed of the orders *Lacertilia* (lizards) and *Ophidia* (serpents). In popular speech the phrase "saurian reptiles" usually means alligators or crocodiles. See REPTILES.

SAURIN, Jacques, zhâk sô-rân, French Protestant preacher: b. Nîmes, 6 Jan. 1677; d.

The Hague, 30 Dec. 1730. After study at Geneva he became pastor in 1701 of a Walloon congregation in London, but in 1705 went to The Hague to take charge of a church of French refugees assembling there in a chapel of the Prince of Orange. Here his pulpit oratory was so greatly admired that it roused the bitter envy of his clerical brethren, who charged him with heresy and subjected him to a series of petty persecutions which shortened his life. His doctrines were those of moderate Calvinism. As a pulpit orator he has been likened to Bossuet, and so far as vigor of presentation goes this may be thought just. He was the author of 12 volumes of 'Sermons,' selections from which were translated into English, and published between 1775 and 1784 in five volumes (with a 'Memoir'), a sixth being added in 1796. Among his other works are 'Etat du Christianisme en France' (1725); 'Abrégé de la théologie et de la morale Chrétienne' (1722); 'Discours sur les événements les plus mémorables du vieux et du Nouveau Testament' (1720-28). Consult 'Life' by Berthault (1875).

SAUROPODA, sâ-rôp'ô-dâ, a sub-order of dinosaurian reptiles which included gigantic forms, such as *Brontosaurus*, *Morosaurus*, *Diplodocus* and the like. (See DINOSAURIA). It is difficult, remarks Gadow, to understand how these huge, long-necked *Sauropoda* lived and moved about. The long neck suggests at first sight predaceous habits, but the teeth, rather feeble in *Diplodocus*, and distinctly of the plant-cutting type in other genera, put this out of the question. The high position of the impaired nasal opening, and the shortened nasal bones of *Diplodocus* are features indicative of aquatic habits, but the short-toed plantigrade limbs are absolutely adapted to terrestrial life, and we cannot well assume that such enormous brutes as *Atlantosaurus* could possibly have ventured into swampy ground.

SAUROPSIDA, a primary division of vertebrated animals, comprising the reptiles and birds, the other two corresponding divisions being the *Ichthyopsida* (fishes and amphibians) and the *Mammalia*. These divisions, set apart by Huxley, are in accordance with genetic relationships. For the similarities in structure between birds and reptiles, showing descent from a common sauropsidan ancestor, see ORNITHOLOGY; REPTILES.

SAURURÆ, the name given by Huxley to an order of the class of birds (see ORNITHOLOGY), constructed for the reception of *Archæopteryx* (q.v.), a fossil bird, the oldest and most primitive bird-fossil known, remarkable for its lizard-like tail.

SAURY-PIKE, or **SKIPJACK**, a fish (*Scomberesox saurus*), having a greatly elongated body covered with minute scales and the jaws prolonged into a long sharp beak. It is about 15 inches long, occurs plentifully on the north Atlantic coasts, frequenting inlets in shoals so dense that it may be taken in pail-fuls. In order to escape the pursuit of the porpoise and large fishes it often leaps out of the water or skims rapidly along the surface. Consult Goode, 'American Fishes' (1888).

SAUSAGE, an article of food consisting of minced meat, highly seasoned, and enclosed generally in the intestines of some animal.

the Romans the sausages of Lucania held in high repute; they were made of pork and bacon finely minced with nuts, stone-pine, and flavored with pepper, fennel seed, bay leaves, pot-herbs and garum. Bologna sausages of Italy are still highly valued; they consist of veal, salt beef, salt pork and bacon, finely chopped up, seasoned with sage, mixed herbs, ground pepper and spices. The smoked sausages of Germany are considered as a delicacy by many; they are made of fat and lean pork preserved for a week by salt, saltpetre, black pepper and spices being rubbed into the meat; it is then cut small and mixed with some shreds of onion or garlic, pressed into an ox-skin, dried in a fold or two of muslin and then smoked in the same way as ham. The pork sausages of our own country are made and sold in various ways to please different tastes. See MEAT PACKING; MEATS AND MEAT CANNING.

SAUSSURE, sô-sûr, **Horace Bénédict de**, French naturalist: b. Conches, near Geneva, 17 Feb. 1768; d. Geneva, 22 Jan. 1799. He began his studies in natural science in Geneva and at 22 was appointed professor of philosophy. Later elected member of the Council of Two Cantons in the new legislature of his country. He has since become famous from his researches into geology, geodesy, the geographical distribution of plants and the applied sciences. His most remarkable work was done in the distribution of plant anatomy. In pursuit of his studies he traveled through France, Germany, England, Italy and Sicily; thoroughly studying the Alps, especially the glaciers of the north, and was the first to reach the summit of Mont Blanc (1787) and to measure its height by barometric pressure. He is also inventor of the electrometer, hydrometer and other instruments. As founder and president of the Society of Arts of Geneva he did much to the industries of that city. His writings the most important are *Essai sur les Alpes* (1779) and *Partie végétale* (1890).

SAUTERNE, sô-têrn', a white Bordeaux wine of high repute, produced from grapes in the neighborhood of Sauternes, a village in the department of Gironde, near Bordeaux.

SAVAGEUR, sô-vêr, **Albert**, American metallurgist: b. Louvain, Belgium, 21 June 1863. Studied at the Liège School of Mines, and came to the United States, was graduated at the Massachusetts Institute of Technology in 1885. He was chemist and metallurgist in difficult works until 1897; and in 1897-1905 he directed the Boston Testing Laboratories. He lectured on metallurgy at the Massachusetts Institute of Technology in 1897; was connected with the Harvard University faculty from 1899, and since 1905 has been professor of metallurgy there, also holding that position at the Massachusetts Institute of Technology since 1917. In 1917 he was metallurgist with the American Aviation Commission in France and has also served since then as metallurgical expert for the French Ministry of Munitions. He edited the *Metallography* in 1898-1903 and the *Iron and Steel* in 1903-06. Author of *Metallography of*

Iron and Steel (1912); *Germany and the European War* (1915).

SAVAGE, Edward, American portrait painter and engraver: b. Princeton, Mass., 26 Nov. 1761; d. there, 6 July 1817. He was a goldsmith and engraver in early life, but eventually turned to portrait painting, and established his reputation through his portraits of Washington, who sat for him several times, and of whom he in 1790 finished the portrait painted as a gift to Harvard. He studied abroad in 1791-94, under West in London and later in Italy. On his return to the United States he established a studio in Philadelphia and later painted in New York, maintaining there for many years an art gallery. He painted portraits of Thomas Jefferson, Anthony Wayne, Knox and other famous persons; finished R. E. Pine's *Congress Voting Independence* (Philadelphia Historical Society), and executed *'Family Group at Mount Vernon'* (1796), as well as making many steel engravings of his own portraits.

SAVAGE, Henry Wilson, American theatrical manager: b. New York, 19th century. He was graduated at Harvard University in 1880 and afterward engaged in the theatrical business. He is president of the Henry W. Savage Company and of the Castle Square Opera Company, Boston; and is director of the National Association of Theatrical Producing Managers of America.

SAVAGE, James, American antiquarian: b. Boston, Mass., 13 July 1784; d. Boston, 8 March 1873. He was graduated from Harvard in 1803, studied law, was admitted to the bar, served in both branches of the legislature and then retired from political life to engage in literary work. He published numerous historical and political pamphlets and edited many works concerning New England history. His work is unfortunately marred by a partisan spirit and is somewhat confused in plan. He wrote *'Genealogical Dictionary of the First Settlers of New England, showing three Generations of those who came before May 1692'* (4 vols., 1862-64), and edited Winthrop's *'History of New England'* (1825-26); Paley's *'Works'* (5 vols., 1828), etc.

SAVAGE, Minot Judson, American Unitarian clergyman: b. Norridgewock, Me., 10 June 1841. He entered Bowdoin College, but left before the end of his course. He was graduated from Bangor Theological Seminary in 1864, and for three years (1864-67) was a Congregational home missionary, in California. There he established churches in Grass Valley and San Mateo. He occupied Congregational pulpits in Framingham, Mass., and Hannibal, Mo. (1867-69), (1869-73). Becoming a Unitarian he became pastor of the Third Unitarian Church in Chicago (1873-74), and a year later became pastor of the church of the Unity, Boston, where he remained for 22 years. In 1896 he became pastor of the church of the Messiah, New York City, resigning the pastorate in May 1906. He represented the more radical element of his denomination, and was the first clergyman who accepted "evolution." He has been a voluminous writer upon ethical and religious subjects. Among his many books are *'Christianity the Science of Mankind'* (1873); *'The Religion of Evolution'* (1876);

'Social Problems' (1886); 'My Creed' (1887); 'Religion of To-Day' (1897); 'Our Unitarian Cause' (1898); 'Life Beyond Death' (1901); 'Life's Darkest Problems' (1905); 'The Passing and Permanent in Religion' (1901).

SAVAGE, Richard, English poet: b. London, 10 Jan. 1698 (?); d. Bristol, 1743. He claimed to be the illegitimate son of Anne, Countess of Macclesfield, by Richard Savage, Earl Rivers, but was probably the son of a woman who had been employed to nurse a natural son of the countess by that earl. This child, according to the countess, died when quite young, and she declared that Savage was an imposter. Savage was apprenticed to a shoemaker, having probably received some education at a grammar school near Saint Albans. He turned to literature and became an author as a means of livelihood. His first work, a pamphlet on the Bangorian controversy, was followed by two comedies, 'Woman's a Riddle,' performed in 1716, and 'Love in a Veil.' These procured him the acquaintance of Sir Richard Steele and Wilkes, the actor. His tragedy, 'Sir Thomas Overbury,' was brought out in 1723, the author himself playing the leading part, but with little success. Savage was rising in reputation when, in 1727, he killed a man in a tavern brawl. He was tried and sentenced to death, but through the influence of Lady Hertford was pardoned. In 1728 appeared 'The Bastard,' a poem of some merit. Soon after Lord Tyrconnel (a nephew of his alleged mother) received him into his house and allowed him £200 a year. In 1729 he published 'The Wanderer: a Moral Poem.' A quarrel with his patron once more turned him adrift upon the world. A birthday ode addressed to Queen Charlotte in 1732 procured him a pension of £50 from the queen. In 1735 a satire against the clergy, entitled 'Progress of a Divine,' caused a prosecution to be instituted against him; but the information was dismissed. From this period he appears to have sunk into the lowest misery. The death of the queen and the loss of his pension completed his ruin, although Pope and a few friends raised a subscription with a view of enabling him to reside in Wales. But at Bristol he was arrested for debt and thrown into the county jail, where, after a detention of some months, he died. Besides the works above mentioned he was the author of much occasional verse and other miscellaneous writings. Savage was the friend and companion of Samuel Johnson at the time when the latter was sleeping in the streets of London homeless and penniless. Consult Johnson, 'Life of Savage' (1744); Galt, 'Lives of the Players'; Boswell, 'Life of Johnson'; Thomas, in 'Notes and Queries' (1858).

SAVAGE, Richard Henry, American soldier and novelist: b. Uxma, N. Y., 12 June 1846; d. New York, 11 Oct. 1903. He was graduated from West Point in 1868 as brevet second lieutenant and in 1871 served as vice-consul of the United States at Rome and Marseilles. In 1872 he was military secretary, with the rank of major, in the Egyptian army and in the latter part of 1872 and during 1873 was United States commissioner to Texas, to settle the Mexican-Texas border dispute. During the Spanish-American War he served as settlor

major of the United States volunteer engineers. He was a voluminous writer and published among other books 'My Official Wife,' which has been translated into 17 languages; 'For Love and Life'; 'In the Shadow of the Pyramids'; 'Brought to Bay'; 'The Midnight Passenger' (1900).

SAVAGE ISLAND, or **NIUE**, an island of the south Pacific, 40 miles in circumference, and lying between the Samoa and Tonga groups. It is very fertile. Chief products—copra, coffee and fruit. Trade is almost exclusively with New Zealand, to which it was annexed in 1901. The inhabitants are a mixed race of Samoans and Melanesians. They are a quiet people and have become Christians. They speak a Samoan dialect.

SAVAGE STATION, Battle of. While General Sumner was engaging General Magruder at Peach Orchard or Allen's Farm on the morning of 29 June 1862, General Franklin was informed that 'Stonewall' Jackson, after repairing the bridges, was crossing the Chickahominy in force and advancing toward Savage Station. Franklin immediately withdrew Smith's division from an isolated and exposed position on Sumner's right and notified Sumner, who at 12 o'clock fell back two and one-half miles to Savage Station and united with Franklin, who had Smith's division only, Slocum's having been sent by McClellan across White Oak Swamp. McClellan had ordered Heintzelman, with his corps, to hold the Williamsburg road until dark, at a point where were several field-works and a skirt of timber between these and the railroad; but through a misunderstanding of his orders, and being convinced, he says, that the whole open space near Savage's was crowded with troops, more than he supposed could be brought into action judiciously, in the afternoon he marched his entire corps, except two batteries, to the rear across White Oak Swamp, without orders from any one, and without a word to Sumner, who, by seniority, was in command, McClellan not being on the field. On reaching Savage Station, Sumner and Franklin drew up in line of battle in a large open field to the left of the railroad, the left, held by Sumner, resting on the edge of the woods, Richardson's division forming his right, Sedgwick's his left. Smith's division on the right extended down to the railroad, with Hancock's brigade reaching into the woods to the right and front to hold the railroad. Davidson's brigade was in reserve, and Osborn's battery was on the line. It was after these dispositions had been made that Heintzelman withdrew and imperiled the left of Sumner's line. Magruder had slowly and cautiously followed Sumner from the Peach Orchard and it was near 5 o'clock when McLaws' division, moving along the Williamsburg road and through the timber that Heintzelman was supposed to be holding, began an attack upon Sumner's left, and was held in check by the vigorous fire of Sumner's artillery. McLaws pressed his attack with great impetuosity, and a hotly contested fight took place on the Williamsburg road. Six regiments of Sedgwick's division, followed by one of Richardson's, were hastened to the threatened point; Brook's Vermont brigade was thrown into the woods that Heintzelman had abandoned, six batteries opened fire,

and at dark, after partial success on either side, the battle ceased, with Sumner's line intact, and the Confederates repulsed. A novel feature of the engagement was the use by the Confederates of a 32-pounder gun, mounted on a platform-car, plated with iron, which was pushed down the railroad, and sent its shells into Sumner's line. Soon after the cessation of the fight, and the destruction of a large amount of supplies, Sumner continued the retreat across White Oak Swamp, abandoning to the Confederates 2,500 sick in the hospitals. McLaws reports a loss of 345 killed and wounded; the total Confederate loss was about 400 killed, wounded and missing. The Union loss is not accurately known.

E. A. CARMAN.

SAVAII (sā-vi'ē) **ISLAND.** See SAMOAN ISLANDS.

SAVANILLA, one of the names of the great tarpon (q.v.).

SAVANNA, Ill., city in Carroll County, on the Mississippi River, 130 miles northwest of Chicago, on the Chicago, Milwaukee and Saint Paul and the Chicago, Burlington and Quincy railroads. It is a shipping point for the produce of the district; has grain elevators, and manufactures sash and doors. Pop. 3,691.

SAVANNAH, Ga., city and capital of Chatham County, on the Savannah River, 18 miles from its mouth. It is the northern terminus of the Atlantic Coast Line system; the eastern terminus of the Central of Georgia Railway; the southern terminus of the Charleston and Savannah Railroad, a part of the Atlantic Coast Line, and the chief south Atlantic terminus of the Southern Railway and the Seaboard Air Line systems; also Savannah and Atlanta Railway, Savannah and Statesboro Railway and Midland Railway, thus being one of the most important railroad centres in the South. It has regular steamship and sailing connections with Boston, New York, Baltimore, Philadelphia, Jacksonville, West Indies, Central and South America, and other ports.

Commerce.—Next to New Orleans, Savannah is the most important commercial city in the South. It is the greatest cotton port on the Atlantic Coast of the United States. It has a water frontage of seven and one-half miles. The largest sea-going vessels load at the city wharves, and the river is navigable by steamers as far as Augusta. It has large exports of cotton, lumber, fertilizers, tobacco and naval stores. The value of its foreign exports aggregating \$104,286,925 places Savannah second in position on the Atlantic Coast in the value of foreign exports.

Manufactures.—The number of industries and their products has largely increased in recent years. The industries include fertilizer plants, cotton-seed oil mills, iron foundries, saw mills, planing mills, rice and flour mills, cotton mills, furniture, sash, doors and blind, broom and varnish factories, printing offices, book binderies, a lithographing establishment, sugar

refinery and barrel manufacturers. About \$10,250,000 is invested in local manufacturing interests, and the annual value of products reaches about \$16,710,000.

Banks and Banking.—There is one national and 10 State banks and nine savings and loan associations, which are under State control, with a total cash capital and surplus of approximately \$10,500,000, with deposits approximately \$50,000,000. The bank clearances for the year ending 1918 were \$435,619,000. The largest State bank south of Baltimore and fourth largest in the entire South is located at Savannah, Ga.

Public Buildings.—The city has a county courthouse, United States post-office and courthouse, city hall, custom-house, arsenal of the First Battalion heavy artillery, armory of First Regiment of infantry, chamber of commerce, cotton exchange, board of trade, Saint Joseph's Hospital, Episcopal Orphans' Home, Savannah Hospital, Telfair Hospital for Females, Masonic Temple, theatre, Odd Fellows' Home, Georgia Historical Society, public library, Telfair Academy of Arts and Science, Auditorium and many large buildings of modern architecture. Ten miles from the city is the Bethesda Orphan House, founded by Rev. George Whitefield in 1740.

Churches and Schools.—Prominent among the church buildings are Christ Church, Wesley Monumental Church, Trinity Methodist Church, First Baptist Church, Saint John's Church, Saint John's Roman Catholic Cathedral, Hebrew Synagogue Mickva Israel and Independent Presbyterian Church. There are over 30 churches in the city, 13 of which are for colored congregations. The city also has the Convent of Saint Vincent de Paul and an excellent public school system. There are 9,000 enrolled pupils in the public schools, which are maintained at an annual expense of \$125,000.

Parks and Monuments.—The streets are wide and beautifully shaded and intersected with parks or squares at regular intervals. In Johnson, Monterey and Madison squares are monuments to Nathanael Greene, Count Pulaski and Sergeant Jasper, heroes of the Revolution. In Forsyth place stands a monument to the Confederate dead. There is also a monument to Tomichichi, the Indian chief, and other public memorials.

Government.—The city is governed by a mayor and city council. The annual cost of maintaining the municipal government is about \$1,200,000. The artesian waterworks system, with 58 miles of mains, cost \$1,250,000. The city has an area of seven square miles with 98 miles of streets, of which 35 miles are paved. The sewer system covers 18 miles of mains. The streets are lighted by electricity at an annual cost of \$39,000; the police department costs annually about \$90,000, and the fire department \$85,000.

History.—Savannah was founded by Gen. James Oglethorpe in 1733 and was chartered in 1789. In 1778 the British captured the city. In October of the following year it was besieged by the American and French forces, and in a battle fought on the 9th of that month the combined armies were defeated. In this assault Count Pulaski was mortally wounded. The town remained in the possession of the British until the close of the Revolutionary

War. During the Civil War the city was a prominent depot of supplies for the Confederate armies and was the objective point of General Sherman in his march to the sea. After a brief defense it was evacuated by the Confederates and the Union army took possession 21 Dec. 1864.

Population.—In 1850 the population was 15,312; in 1900, 54,244. The corporate limits of the city have since been extended and the population in 1910 had increased to 65,064. At present the population is estimated at 100,000.

THOMAS PURSE,

Secretary of Savannah Board of Trade.

SAVANNAH, Mo., city, county-seat of Andrew County, on the Chicago Great Western and the Kansas City, Saint Joseph and Council Bluffs railroads, 13 miles north of Saint Joseph. It was settled in 1842 and was incorporated as a city in 1854. It is the centre of an agricultural, fruit-growing and stock-raising region, and has a flour mill and a creamery. The city has a public high school with a school library of over 700 volumes. Pop. about 2,000.

SAVANNAH, a river formed by the junction of the Tugaloo and Seneca rivers, and which, from its source, forms the boundary between Georgia and South Carolina. The length of the channel from its source to its mouth is 450 miles, but from the source to the mouth in direct line is only 250 miles. The area of the drainage basin is about 8,500 square miles. The current in the upper part of its course is rapid; considerable quantities of silt are brought down each year, and bars form in the broad portions of the stream where the current moves slowly. The tidal wave ascends to a point about 25 miles above Savannah. At Savannah the rise and fall of the tide is six and one-half feet. The river is navigable for small vessels to Augusta, 230 miles, and for large vessels as far as Savannah.

SAVANNAH (Ga.) OPERATIONS AGAINST, in the American Revolution. Since operations in the North had been barren of results, the British determined to renew the attack on the South, beginning the campaign at Savannah. Late in November 1778 Col. Archibald Campbell sailed from New York, landing three weeks later near the mouth of the Savannah River, and quickly dislodging a small force of Americans who attempted to dispute the British advance. Gen. Robert Howe (q.v.) with 800 American troops encamped between the landing place and the city, but a negro apprised Campbell of a by-path by which he could gain the rear of the American camp, and in the battle that followed the Americans found themselves between a cross-fire. Hence they retreated, leaving 100 of their number dead and wounded and about 400 in British possession. The Americans fled up the Savannah River and crossed into South Carolina, while the British occupied the city and remained in possession until the close of the war. Meanwhile, in November 1778, Comte d'Estaing (q.v.) had sailed with a French fleet to attack the British West Indies, after which, at the solicitation of the Americans, he went to Savannah, arriving 1 Sept. 1779 with 22 ships of the line and other smaller vessels. Gen. Benjamin Lincoln (q.v.) with 1,000 troops, reinforced by troops under Count Pulaski (q.v.), and Colonel

McIntosh and a detachment of 3,000 French troops, lay siege to the city by land while d'Estaing carried on the naval operations. The city was defended by Gen. Augustine Prevost (q.v.) with about 2,500 troops. On 23 Sept. 1779 siege works were begun and on 1 October the various batteries opened the bombardment, which continued for several days without effect. Despairing of capturing the city by this method the allied forces decided to storm the British works. Accordingly, on 9 October, 4,500 French and Americans advanced in three columns, but were met with such a galling fire from the British batteries that, though successful in planting standards on the redoubts, they were repulsed with considerable loss. With 200 troops Pulaski endeavored to strike the garrison in flank, but he was killed and his troops dispersed. Unable longer to withstand the British fire, the attacking forces retired, the French having suffered a loss of 640 killed and wounded and the Americans 450. The British loss was comparatively small. On 18 October the siege was abandoned, the Americans recrossing the Savannah at Zubly's Ferry, and taking position in South Carolina, while the French embarked on their ships and sailed away. Consult Stedman, Charles, 'American War' (Vol. II, pp. 121-134); Lossing, 'Field-Book of the Revolution' (Vol. II); Lee, Charles, 'Memoirs of the War' (Vol. I, pp. 99-112); Carrington, H. B., 'Battles of the Revolution' (pp. 478-482); McCrady, Edward, 'South Carolina in the Revolution' (pp. 403-417); Mahan, Alfred T., 'The Influence of Sea Power upon History' (pp. 374-375); 'Georgia Historical Society Collections' (Vol. V, Pt. I); Moultrie, 'Memoirs' (Vol. II, p. 41); Ramsay, David, 'Revolution in South Carolina' (Vol. II); Wiley and Rines, 'The United States' (Vol. III pp. 159-171); Lowell, E. J., 'Hessians in the Revolution.'

SAVANNAH TO GOLDSBORO, Sherman's Campaign from (including the battles of Averasboro and Bentonville). Sherman's March to the Sea (q.v.) culminated in the capture of Savannah 21 Dec. 1864. It was a brilliant campaign, but of minor importance compared with that upon which he immediately prepared to enter. He says: "Were I to express my measure of the relative importance of the march to the sea, and of that from Savannah northward, I would place the former at one, and the latter at 10, or the maximum." Before the capture of Savannah, Sherman had received from General Grant a letter, dated 6 December, in which he had given his idea of Sherman's further movement, which was to establish a base on the sea-coast, fortify it, leave all artillery and cavalry, and enough infantry to protect them and threaten the interior, so that the militia of the South would have to be kept at home, and with the remainder of his command take transports for James River, join Grant before Richmond and participate in the destruction of Lee's army and the overthrow of the Confederacy. Sherman replied: "I had expected, after reaching Savannah, instantly to march to Columbia, S. C., thence to Raleigh, and then to report to you." After the surrender of Savannah, Grant (27 December) accepted Sherman's plan and instructed him to start on his expedition northward without further delay, break up the railroads in South Carolina

SAVANNAH, GEORGIA

A General View of the City

and North Carolina and join the armies operating against Richmond as soon as he could and by the route he deemed best. Sherman hastened his preparations; General Grover's division of the 19th corps was detached from the Army of the Shenandoah and ordered to Savannah as a garrison, and General Foster, commanding the Department of the South, was instructed to follow Sherman's inland movements by seizing in succession Charleston and other points on the coast, which might be abandoned. Ammunition, rations and clothing were accumulated, and 14 Jan. 1865 the 17th corps, General Blair, took transports at Savannah for Hilton, S. C., and moved to Beaufort, thence to Pocolaligo, on the Charleston and Savannah Railroad, thus threatening Charleston. Later the 15th corps, except Corse's division, joined the 17th. The left wing, 14th and 20th corps, under General Slocum, with Corse's division and Kilpatrick's cavalry, moved up the Savannah River, 40 miles, to Sister's Ferry, thus threatening Augusta. When Slocum arrived at Sister's Ferry the river had overflowed its banks and submerged the adjacent lowland, and there was a delay of some days before the waters had fallen sufficiently for a crossing. On 1 February, when the general movement began, the army was composed of two wings: the right wing, under Gen. O. O. Howard, consisted of the 15th corps, Gen. John A. Logan, and the 17th corps, Gen. F. P. Blair; the left wing, under Gen. H. W. Slocum, consisted of the 14th corps, Gen. J. C. Davis, and the 20th corps, Gen. A. S. Williams. The cavalry division, under General Kilpatrick, moved with the left wing, as also, at first, Corse's division of Logan's corps. The strength of the army 1 February was 53,923 infantry, 4,438 cavalry and 1,718 artillery, in all 60,079 men with 68 guns. There were about 600 ambulances, 2,500 wagons and provisions for 20 days, mostly of bread, sugar, coffee and salt. Beef cattle were driven and it was expected that a good supply of cattle, hogs and poultry would be gathered on the march. The disposition of the forces from Sister's Ferry on the left to Pocolaligo on the right menaced Augusta, Columbia and Charleston and left the Confederates in doubt as to the true point upon which Sherman was to move. The Confederates, under General Hardee, whose headquarters were at Charleston, and who had about 16,000 men, occupied the line of the Salkehatchie River, while Wheeler's cavalry operated on the heads and flanks of the advancing column. On 1 February the movement began. Howard's right wing marched from Pocolaligo for the Beaufort and Rivers' bridges of the Salkehatchie for the purpose of pushing on to the Edisto River, thus flanking Charleston. There was a sharp engagement (3 February) at Rivers' bridge, in which two divisions of Blair's corps waded breast deep through the swamp and carried the bridge with a loss of 88 killed and wounded, the Confederate loss being 52 killed and wounded. The Confederates, driven from the line of the Salkehatchie, retreated to Branchville, behind the Edisto, burning the bridges behind them. The left wing, under Slocum, marched through Barnwell, and on 10 February both wings were in the vicinity of Branchville on the Charleston and Augusta Railroad. Kilpatrick on the left went as far

as Aiken and threatened Augusta. From Branchville the railroads in every direction were thoroughly destroyed, and the army started for Columbia, each of the four corps taking a separate road. Howard went by the Orangeburg road, and on the 16th his head of column approached Columbia, which was occupied by Gen. C. L. Stevenson's division of infantry, and Butler's and Wheeler's divisions of cavalry, in all about 5,000 men. Stevenson fell back to Winnsboro, leaving Wade Hampton, commanding the cavalry, to follow. On the 17th the 15th corps marched through the city and encamped beyond it on the Camden road. During the night the greater part of the city was accidentally burned. Slocum, advancing by Barnwell and Lexington, destroyed the Charleston and Augusta Railroad for several miles, and, after menacing Augusta, received orders to cross the Saluda River, at Mount Zion's Church, above Columbia. During the night a bridge was constructed and next day Slocum and Kilpatrick crossed, passed over Broad River and on the 21st arrived at Winnsboro, destroying on the way several miles of railroad north and south of Alston. Sherman, with the right wing, marched from Columbia, on the 20th, on the direct road to Winnsboro, and threatened Charlotte, N. C. He destroyed the railroad between Columbia and Winnsboro, and joined Slocum at the latter place. On the day that Sherman occupied Columbia, General Hardee evacuated Charleston, after destroying the public buildings, two iron-clad steamers, cotton and other property, and with about 14,000 men moved to Cheraw, on the Pee Dee River, and thence by a long march to Fayetteville, N. C. Next day Charleston was occupied by the Union troops of General Foster, who found 450 abandoned guns. The city had been fired, churches and private residences burned and everything presented a scene of desolation. Sherman, in his march, had made a clean swath of 40 miles, burning bridges, wrecking railroads and devouring nearly everything. Each family was left a reasonable amount of food, but all horses, mules and wagons were taken. From Winnsboro, Slocum destroyed the railroad as far north as Chester, threatened Charlotte, and then, forcing to the left the Confederates who were concentrating to dispute the march on Charlotte, the entire army turned eastward for Fayetteville, Slocum crossing the Catawba River at Rocky Mount and joining Howard, who had marched by roads farther south, at Cheraw (3 March), where were found 24 guns, 3,600 barrels of gunpowder and large supplies of stores, public and private, sent from Charleston for safe-keeping. Hardee made no opposition to the occupation of the place, and retreated to Fayetteville, leaving Wade Hampton's cavalry to cover his rear and burn the bridges behind them. On the 6th Sherman resumed his march on Fayetteville, by four different roads, and reached it on the 10th, Hardee again retreating without a show of defense, leaving Wade Hampton to skirmish with Sherman's advance and burn the bridge over the Cape Fear River. Kilpatrick, covering the movement on Sherman's left and rear, was surprised on the night of the 9th by Hampton's cavalry and pretty roughly handled, being driven from his camps and losing all his guns, which, however, he regained. He lost 183 men,

of whom 103 were captured. The march through South Carolina had been greatly delayed by almost incessant rains and the swampy nature of the country. Nearly all the way the army was compelled to corduroy the roads before the trains could be moved, in some instances the first corduroying was out of sight before the trains had all passed, and another road was laid over it. All this was done cheerfully by the men, working in icy water up to their knees. Before reaching Fayetteville it was heard that General Terry had taken Wilmington, and the day after the arrival of the army a Union steamer came up Cape Fear River, confirming the news and bringing mails and dispatches. Having thoroughly destroyed the arsenal buildings, foundries and machine-shops at Fayetteville, the army crossed Cape Fear River on the 13th and 14th for Goldsboro, the objective point of the campaign, where it was to unite with Generals Schofield and Terry, who were marching on that place from Newbern and Wilmington. It was now known that Gen. J. E. Johnston had been ordered to delay Sherman's advance, and Sherman estimated that he had 37,000 men for the purpose. Apprehending that Johnston would seek an opportunity to strike him on the last stage of the march, Sherman ordered Slocum on the left to send his trains under a strong guard by an interior road on his right, and to keep at least four divisions with their artillery on the left well in hand, to meet an attack. Under this order Geary's and Baird's divisions were detailed to guard the trains. Slocum, preceded by Kilpatrick's cavalry, advanced on the direct road to Averasboro, to make a feint on Raleigh, and Kilpatrick was then to strike the railroad near Smithfield. Sherman says he "proposed to drive Hardee well beyond Averasboro and then turn to the right by Bentonville for Goldsboro." On the 15th Hardee was retiring from before Slocum, having for his rear-guard a brigade composed of artillery troops that had garrisoned Charleston, under command of Col. Alfred Rhett. During the evening Kilpatrick, in skirmishing with this rear-guard, near Taylor's Hole Creek, took some prisoners, among whom was Colonel Rhett.

Battle of Averasboro.—On the morning of the 16th opposition to the march was quite stubborn, and Kilpatrick, forcing back the Confederate rear-guard, came upon a line of intrenchments, on a narrow neck of swampy land, between Cape Fear and South rivers, and covering the road to Bentonville, along which Sherman intended that Slocum's wing should march to Goldsboro. Kilpatrick's cavalry was moved to the right and Jackson's and Ward's divisions of Williams' 20th corps were deployed in front of the Confederate line, and the two divisions of the 14th corps ordered up on Williams' left. Case's brigade was sent by Williams to the left to gain the flank and rear of the Confederate line, and succeeded in striking it in flank and sweeping it from position, capturing McBeth's Charleston battery of three guns and 217 of Rhett's artillery acting as infantry. Jackson's and Ward's divisions advanced and came upon the Confederates in another line of works about 400 yards in rear of the first. Kilpatrick was sent to the right to seize the Bentonville road, but his leading brigade was driven back by a furious attack of

McLaws' division, upon which the Union infantry advanced directly against Hardee, who also was advancing, and drove him inside his works, and Slocum went into bivouac in his immediate front. During the night, which was stormy and very dark, Hardee retreated, leaving 108 dead and 68 wounded on the field. His entire loss, as estimated, was about 650, of whom 175 were captured. Slocum's loss was 77 killed and 477 wounded. Next morning Ward's division pursued Hardee a short distance beyond Averasboro and ascertained that he had retreated toward Smithfield.

Sherman was now under the delusion that no serious opposition would be made to his march on Goldsboro. "All signs," he says, "induced me to believe that the enemy would make no further opposition to our progress, and would not attempt to strike us in flank, while in motion." Under this impression his commanders were instructed to march their troops in the easiest manner and by the nearest roads to Goldsboro. The left wing marched from Averasboro on the direct road and on the night of the 18th, after driving back Hampton's cavalry to a position selected by Hampton for a battle, the 14th corps in advance, encamped 25 miles from Goldsboro and five from Bentonville, at a point where the road from Clinton to Smithfield crossed the one to Goldsboro. Two divisions of the 20th corps were camped 10 or 12 miles in rear, while Geary's and Baird's divisions were on other roads, with the trains still farther to the south. Howard's two corps were to the south and east, their advance at Lee's Store, more than a day's march distant. Sherman had been with Slocum and the left wing since the 14th and very early on the morning of the 19th started to join Howard, several miles to the east and south, to concentrate his forces and unite with Slocum at Goldsboro, where he expected to meet Schofield and Terry. He had no suspicion that General Johnston with a strong force was then in Slocum's immediate front, and supposed that the only opposition to be met would be from cavalry. When about to leave Slocum he expressed the opinion that Hardee had fallen back to Raleigh and that Slocum could reach Neuse River the next day, in which opinion Slocum concurred. But General Carlin, commanding a division of the 14th corps, and who was nearest the enemy, had observed matters that indicated a large force in front prepared for battle, and sought to impress his own convictions upon Sherman, who made light of them, said nothing but cavalry was in front and rode away to join Howard.

On 23 February Gen. J. E. Johnston had been assigned to the command of all the forces that could be collected to make head against Sherman. At this time Hardee was moving toward Fayetteville, N. C.; Beauregard was directing the march of C. L. Stevenson from Winnsboro to Charlotte; Cheatham, with his division of Hood's army, had come from Augusta, Ga., and was moving toward Charlotte, but on the west side of the Congaree and Broad rivers, and A. P. Stewart, with about 1,000 men of Hood's army, was marching for Charlotte. Johnston's first task was to concentrate these troops, which was done at Smithfield, N. C., where he was joined by Hoke's division from Lee's army at Richmond, which had unsuccessful-

fully engaged General Cox, near Goldsboro (see KINSTON, BATTLE OF), and also by S. D. Lee, with about 3,000 men of Hood's army. In all Johnston had about 20,000 men. He had as subordinate commanders Generals Bragg, Hardee, A. P. Stewart, S. D. Lee, Wade Hampton and others of high rank, who had long been the pride and ornaments of the Confederate armies.

Battle of Bentonville.—On the 17th General Johnston had become satisfied that Sherman was not marching on Raleigh. He heard on the morning of the 18th that Sherman was marching on Goldsboro, and was informed by Wade Hampton that the 14th corps was in his immediate front, that the 20th corps was several miles in rear on the same road, while Howard's two corps were on roads some miles to the south, and he determined to crush the 14th corps before the 20th could come to its support, and then fall upon the 20th. He ordered Hampton to hold Slocum's head of column in check until he could march from Smithfield, 16 miles distant, and join him to give battle on ground that Hampton had selected, and to which he was forced back that evening, which was at a point about three miles south of Bentonville. In order to attack the head of Slocum's column early next morning, Johnston immediately marched his army from Smithfield, intending to bivouac that night between Bentonville and the road on which Slocum was moving. But the distance was greater than expected, the roads bad, and but a small part of the column reached Bentonville that night, the main column bivouacking some distance in the rear. As soon as Hardee's troops reached Bentonville next morning they were marched by the left flank, Hoke's division leading, to the ground selected by Hampton, on the eastern edge of an old plantation, extending one and one-half miles to the west, lying principally on the north side of the road, and surrounded east, south and north, by dense thickets of black-jack. As there was but one narrow road through the thicket, the deployment of the troops consumed a weary time. Hoke's division was formed with its centre on the road, its line at right angles to it, on the eastern edge of the plantation, and its left extending some 400 yards into the thicket to the south. Two batteries, the only artillery, were on his right, commanding the ground in front to the extent of the range of the guns. The troops belonging to the Army of Tennessee were formed on the right of the artillery, their right strongly thrown forward, conforming to the edge of the open ground. Meanwhile, and before these dispositions had been completed, the battle had opened. Very early in the morning Hampton had thrown forward his cavalry, and when Carlin's division of the 14th corps began its march at 6 o'clock it became almost immediately engaged with the Confederate cavalry, which offered such a stubborn resistance that Carlin deployed his entire division and brought up his artillery, and one brigade was sent to the left to develop the Confederate line, and as the resistance increased Morgan's division was moved to Carlin's right as a support, and the entire line was ordered to go forward, and was soon severely engaged, convincing Slocum that he had something more than cavalry in his front,

of which fact he was soon further convinced by a deserter from the Confederates, who informed him that Johnston was in his immediate front, and that the talk in the Confederate camp was that Slocum was to be crushed.

Slocum prepared for defense by throwing up works, ordered Williams, commanding the 20th corps, to throw his train to the right and hasten up, and sent a messenger to Sherman with the information that Johnston's army was in his front. Carlin's division in advancing struck Hoke's division and after some severe fighting was repulsed, upon which Johnston ordered Hardee to charge with the right wing, Stewart's Army of Tennessee troops and Taliaferro's division, and General Bragg to join in the movement with his brigades successively, from right to left, each making the necessary change of front to the left in advancing. Hardee led his men forward and drove Carlin back just as the advance of the 20th corps came up, one brigade of which was sent to Carlin's support, and was driven back with him, and another put in the gap between Carlin and Morgan just as the Confederates reached the line, the remainder of the corps forming on Carlin's left. The Confederates had become somewhat broken up in advancing through the woods, and when they received a telling fire from behind the slight entrenchments that had hurriedly been thrown up they fell back. On the right Morgan's division of the 14th corps, with its supports, held its ground against Bragg's persistent attacks. The Confederate assaults were repeated several times until a late hour, each assault finding the Union line better prepared to receive it. Johnston had given the 14th corps a heavy blow, but had failed to crush it, and determined not to renew the attack, but only to hold the ground until his wounded could be removed. The battle of the 19th was fought by about 16,000 men of the 14th and 20th corps on one side and about the same number of Confederates on the other.

When Capt. Joseph B. Foraker delivered to Sherman the message from Slocum that he had run up against Johnston's whole army, Sherman was incredulous, but he sent word to Slocum to hold on, ordered the 15th corps, which was well to the rear, to turn at once toward Bentonville, and the 17th corps to move in the same direction. Hazen's division of the 15th corps reported to Slocum during the night and was placed on the right. Early in the morning of the 20th Geary and Baird, each with two brigades, arrived on the field. Baird was placed in front of the works and moved out beyond the advanced position held on the preceding day. The day was spent in strengthening the position and developing the line of the enemy, which brought on sharp skirmishing. The right wing under Howard came up late in the afternoon of the 20th and on the morning of the 21st. It had marched 20 miles over bad roads, skirmishing a great part of the way with the Confederate cavalry. There was heavy skirmishing during the day, but no general attack, and during the night Johnston retreated, crossing Mill Creek by the bridge at Bentonville and bivouacking on the night of the 22d near Smithfield. The Union loss in the battle was 191 killed, 1,168 wounded and 287 missing,

an aggregate of 1,643. The Confederate loss was 239 killed, 1,694 wounded and 673 missing, an aggregate of 2,606.

On the 22d Sherman resumed his march on Goldsboro and on the 23d and 24th his entire army was assembled around the place and junction made with Schofield's and Terry's forces, which had occupied it two days before. (See *GOLDSBORO*, *KINSTON*, etc.). "Thus," writes Sherman, "was concluded one of the longest and most important marches ever made by an organized army in a civilized country. . . . The country generally was in a state of nature, with innumerable swamps, with simply mud roads, nearly every mile of which had to be corduroyed. In our route we had captured Columbia, Cheraw and Fayetteville, important cities and depots of supplies, had compelled the evacuation of Charleston City and Harbor, had utterly broken up all the railroads of South Carolina and had consumed a vast amount of food and forage, essential to the enemy for the support of his own armies. We had in mid-winter accomplished the whole journey of 425 miles in 50 days, . . . and had reached Goldsboro with the army in superb order and the trains almost as fresh as when we had started from Atlanta." Consult 'Official Records' (Vol. XLVII); Van Horne, 'History of the Army of the Cumberland' (Vol. II); Sherman, 'Memoirs' (Vol. II); Johnston, 'Narrative'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

SAVARY, sā-vā-rē, **Anne-Jean-Marie-René**, DUKE OF ROVIGO, French general: b. Marcq, department of Ardennes, 26 April 1774; d. Paris, 2 June 1833. In 1789 he entered an infantry regiment. He served under Custine, Moreau and Desaix, and accompanied the last named on the expedition to Egypt. After the battle of Marengo he was appointed adjutant to Bonaparte, and soon rose very high in his confidence. After rising to the rank of lieutenant-general he was rewarded, after the victory of Friedland, with the title of Duke of Rovigo. In 1808 the emperor sent him to Madrid, where he negotiated the arrangement by which the Spanish king and his son were kidnapped. In 1810 he succeeded Fouché as minister of police. On Bonaparte's return from Elba he gave in his adhesion to him, and was appointed inspector-general of gendarmes. He was carried to Malta in 1815, but escaped after being a prisoner for seven months. While there he began his 'Memoirs.' Later he stood trial at Paris as one who had contributed to Napoleon's return, but was acquitted. In 1831-33 he was military commander of Algiers.

SAVASTANA. See *GRASSES IN THE UNITED STATES*.

SAVE, sāv, or **SAU**, sow, Austria, a river tributary to the Danube, formed near Radmannsdorf from the waters of the Wurzen and Wochlein Save which have their source in the eastern slope of the Julian Alps, and flow south-east through Illyria, along the southern part of Styria into Croatia. At the frontier it becomes exceedingly tortuous, and finally flows through the Wocheiner See. The fall is rapid until the Leibach is received, and then the river becomes navigable, flowing through a narrow valley enclosed by mountains; it follows a circuitous route for about 540 miles

and joins the Danube at Belgrade. Its main tributaries are all on the right—the Kulpa, Unna, Verbas, Bosra and Dvina. In the lower part, forming the boundary between Austria and Servia, it flows through flat plains, often devastating them by inundation. It forms an important outlet for the produce of the districts through which it flows.

SAVERY, Thomas, English engineer: b. Shilstone, near Modbury, Devonshire, about 1650; d. London, May 1715. He became a military engineer and rose to be captain in 1702. He is known for his inventions, most important of which was a machine for raising water from mines, which was the first practical application of steam power to a mechanical purpose. A patent granted him in 1698 extended until 1733.

SAVIDGE, Eugene Coleman, American physician and author: b. Maryland, 21 Oct. 1863. He was graduated from the University of France in 1888; from that of New York in 1889. He was for a time editor of the *Expressman* and is now attending gynecologist at Saint Mark's Hospital, New York. He has written 'Wallingford' (1882); 'Life and Times of Brewster' (1891); 'The American in Paris' (1895); 'Selective Involution'; 'Philosophy of Radio-Activity' (1914); 'The Problem of Cancer'; 'Unclassified Dreams' (1915).

SAVIGNY, sā-vën-yē, **Friedrich Karl von**, German jurist: b. Frankfort-on-the-Main, 21 Feb. 1779; d. Berlin, 25 Oct. 1861. He studied chiefly at Marburg, became a lecturer there in 1800, and in 1803 professor of jurisprudence. In 1808 he was made professor of law in the University of Landshut, in Bavaria, and in 1810 obtained the chair of jurisprudence in the newly established University of Berlin, where he continued to lecture with uninterrupted success for 32 years. He was elected a member of the Prussian Academy of Science in 1811, was appointed a councilor of state in 1817 and in 1842 Minister of Justice for the revision of the law. He retired in 1848. His principal works are 'Geschichte des römischen Rechts im Mittelalter' (1815-31); 'System des heutigen römischen Rechts' (1840-48), to which 'Das Obligationenrecht' (1851-53) forms an appendix; 'Vermischte Schriften' (1850), a collection of essays which had appeared in legal periodicals. He brilliantly applied the historical method to the exposition of the Roman law. Consult the biographies by Bethmann-Hollweg (1867) and Enneccerus (1879).

SAVILE, sāv'il, or **SAVILLE**, George, MARQUIS OF HALIFAX, English statesman and writer: b. Thornhill, Yorkshire, 11 Nov. 1633; d. London, 5 April 1695. On the death of Cromwell he distinguished himself by his exertions in behalf of Charles II. In 1669 he was appointed a commissioner of trade, in 1672 became a member of the Privy Council, and in 1682 was created Marquis of Halifax and lord privy seal. Under James II he was made president of the council, but was dismissed from office because he opposed the repeal of the Test and Habeas Corpus Acts. From this time Lord Halifax continued in opposition, and contributed to the elevation of William III to the throne. He was the author of 'Advice to a Daughter' (1668), and of a variety of political tracts, the principal of which are 'Maxims of State'; 'The

Character of a Trimmer'; 'Character of King Charles II'; 'Anatomy of an Equivalent'; 'Letter to a Dissenter.'

SAVILE, Sir Henry, English scholar: b. Bradley, near Halifax, Yorkshire, 30 Nov. 1549; d. Eton, 19 Feb. 1622. He was educated at Oxford, became tutor in Greek to Queen Elizabeth, and in 1585 was made warden of Merton College and provost of Eton in 1596. He was knighted in 1604. In 1619 he founded two professorships in geometry and astronomy at Oxford, besides conferring several other valuable benefactions, both in property and books. Among his works the principal are his 'Commentaries on Roman Warfare' (1591); 'Rerum Anglicarum post Bedam Scriptores' (1596); 'Prælectiones tresdecim in principium elementorum Euclidis' (1621); and his edition of the writings of Saint Chrysostom (1610-13), in eight folio volumes, a work on which he is said to have spent £8,000.

SAVILLE, Marshall Howard, American archaeologist: b. Rockport, Mass., 24 June 1867. He studied anthropology as a special student at Harvard University in 1889-94, and afterward engaged in field work under Prof. F. W. Putnam. He conducted a series of investigations of the remains of the Ohio Mound Builders, making some notable discoveries. He also made important explorations in Yucatan in 1890; in Honduras in 1891-92, 1915; in Mexico in 1899, 1902-04; in Ecuador in 1906-10, 1913; in Colombia in 1914; and in Central America in 1917. He was assistant curator at the American Museum of Natural History in 1894-1902; and in 1902-05 curator of anthropology and Mexican and Central American anthropology there. Since 1903 he has been professor of American archaeology at Columbia University. He is author of numerous monographs on anthropology and archaeology.

SAVONA, sā-vō'nā, Italy, in the province of Genoa on the west coast of the Riviera, 26 miles southwest of Genoa, is one of the most important towns of that region. It is picturesquely situated amid vine-clad hills and orange groves. The Castle of Saint George (1542) is now a military prison; the other buildings deserving notice are a Renaissance cathedral, with the magnificent tomb erected by Sixtus IV to his parents; the Della Rovere Palace, now occupied by municipal officers; other churches, a lyceum, a technical and a commercial institute, other educational institutions, a fine theatre, and a large hospital. It is a centre of the iron industry, having foundries of all kinds, besides glass-works, potteries, tanneries, brickyards and sulphur mills. It is an important seaport. Its chief imports are coal, petroleum, iron, cereals, and the exports consist of tomatoes, wood and candied fruits. The harbor, which is good, is defended by a fort. Pop. 50,000.

SAVONAROLA, Girolamo, jē-rō'lā-mō sā-vō-nā-rō'lā, Italian religious reformer: b. Ferrara, Italy, 21 Sept. 1452; d. Florence, 23 May 1498. As a boy he was well acquainted with mediæval learning and his family intended that

he should become a physician, but a disappointment in love turned his thoughts to the church, and in 1475 he left home secretly and joined the Dominican order. After passing a severe novitiate in the monastery at Bologna he was made a teacher there, and in 1482 was sent to Saint Mark's monastery in Florence where he became disgusted at the corruption in church and state, and began to attack the abuses in his sermons. His first success as a preacher was at Brescia in 1484-85. He fascinated the worldly Italians by his terrible denunciations of vice and wickedness, and returned to Florence with a reputation as a popular preacher. In 1490 he was made *lector* in Saint Mark's, and crowds came to hear him. A year later he was chosen prior of Saint Mark. Though his convent had been favored by Lorenzo di Medici, Savonarola refused to do homage to him, as was customary. Lorenzo tried in vain to conciliate the friar who continually preached against the abuses in state and church. In 1492, Lorenzo di Medici, the chief opponent to the work of Savonarola in Florence, died. In the political confusion that followed, and during the invasion of Italy by Charles VIII of France, Savonarola by his public services acquired great influence among the Florentines. He desired a democratic government for Florence, and, when in 1494 the people drove out the Medici, he opposed the schemes of the aristocracy to seize the government, called a mass-meeting of the citizens and practically assumed the dictatorship of Florence, superintending the formation of a government in which the people were to fear God and amend their conduct, and prefer public to private interests. A general amnesty was proclaimed, and a council modeled on that of Venice was chosen to administer the government. There was no doge as in Venice, but for three years Savonarola was dictator. His enthusiasm for liberty, his zeal in religion, and his eloquent sermons, caused light-hearted pleasure-loving Florence to become a city of Puritans. Thomas Aquinas and the Old Testament furnished the spirit of the laws. Though not of the Renaissance and hostile to its spirit, especially to the pagan influence derived from the classics, Savonarola was not an enemy to learning and fine arts, though in 1497 he encouraged committees of children and devotees to search the city for frivolous books, cards, profane songs and music, and works of art of evil tendencies, which were destroyed under the direction of the government. No good books or works of art were destroyed at this time, though the next year many were lost in a second "burning of the vanities." Savonarola aimed at reforming the Church in the same caustic way. With his moral reforms he closely knitted political schemes and doctrines, and several times preached vigorously against Pope Alexander VI, who first tried to conciliate him. Savonarola spurned his advances, and in 1496 was ordered to cease preaching, and to undergo a trial for heresy. Silent for a time, Savonarola was attacked by the Franciscans and began again to preach. In 1497 he was excommunicated and Florence was threatened with an interdict if she harbored him. For a year he defied excommunication and demanded that a general council be called to depose Pope Alexander. But he had presumed too much upon the support of fickle citizens. Many were weary of

the Puritan rule and longed again for the flesh pots of Egypt; the other cities of Italy were hostile to Florence because of her course during the French invasion and because of her democratic government; there had been famine and pestilence, which Savonarola had been unable to alleviate; some of the followers of the Medici had been executed and thus powerful enemies made; and now Florence was threatened with an interdict. Savonarola had to be guarded by armed followers when he went to preach. In 1498, while still powerful, he in a sermon had called upon Heaven to consume him with fire if he had acted from unchristian motives. A friar of the Franciscan order thereupon offered to pass through the ordeal of fire with Savonarola, who treated the offer with contempt. But the Dominicans volunteered to undergo the ordeal to show their faith in Savonarola, and after hesitation, which his enemies made the most of, Savonarola consented to the judgment by ordeal, believing in Divine intervention in his favor. The fires were made ready and the opposing champions seemed ready to enter the flames, when the Franciscans, who had no intention of carrying out the judgment by ordeal, began to raise disputes to cause delay. They insisted that the Dominicans must not bear the crucifix nor the host through the flames. Savonarola would not agree to give up the latter and the dispute lasted until a rain came and gave the Franciscans an opportunity to slink away. But upon Savonarola was blamed the failure of the ordeal. The populace was infuriated because they had missed the show, and called Savonarola an impostor who was afraid of the ordeal. Florence turned against him; he was arrested, accused of heresy and after six days' torture and a hasty and unfair trial, was condemned to be hanged and then burned. The sentence was carried out with all the refinements of cruelty. Savonarola was a powerful, typical mediævalist, hostile to many of the manifestations of the Renaissance spirit. His talent for political organization was profound, but he was mistaken in thinking the Florentines capable of self-control in politics or of puritanism in religion. The Italian despots understood the people better than Savonarola, and only as a despotic leader was Savonarola himself to any degree successful. His ideals were those of an ascetic, uncompromising, rigid. An eloquent speaker, he, for a time, imposed his ideals upon the Florentines, who when weary of being good, left him to his enemies. Of a mystical turn of mind, he attached great importance to dreams and visions which he related in his sermons. The writings of Savonarola were voluminous, embracing sermons, essays and poems on religious subjects, and a treatise on the government of Florence.

SAVONNERI TAPESTRY. See **TAPETRIES**.

SAVOU, sā-voo', **SAVOE**, or **SABOE**, an island of the Asiatic Archipelago in the Indian Ocean, near the islands of Timor and Sandalwood. It covers an area of 237 square miles. The surface is elevated in the centre, sloping seaward. It is well-watered and fertile, yielding millet, corn, beans; tropical products as usual in this latitude, including betel, cinnamon, mangoes, cotton, tobacco, etc. Domestic animals are numerous, besides buffalo, wild boars and deer. Horses and tobacco are the chief exports, sent to Timor. The island consists of five principalities, subject to the Dutch government of Timor. The inhabitants are Malays—a strong race with pagan practices, including dog sacrifices. Pop. 16,000.

SAVOY, House of. The territory of Savoy formed part of ancient Gaul, and from 122 B.C. to 407 A.D. was in possession of the Romans, by whom it was divided into two provinces, the Graian and Pennine Alps. At the latter date it was seized by the Burgundians, but with Burgundy it became subject to the Franks in 534, was included in the Carolingian empire, and on its dissolution in 887 was granted by the Diet of Tribur to Rudolph, king of Transjurane Burgundy, and with that kingdom was united to Cisjuran Burgundy or Arles. On the accession of the last king of Arles to the imperial throne as Conrad II in 1027, the more powerful nobles of northwestern Italy, such as the Marquis of Susa, the Counts of Maurienne, Turin and Chablais, became vassals direct of the emperor. Umberto Blancamano, Count of Maurienne, was the first of the family who took a prominent place among the princes of northern Italy. His nephew, Amadeus II (1060-80), in right of his mother, Adelaide, heiress to the Marquisate of Susa, added nearly the whole of Piedmont to the original possessions of his house. Humbert II, his son and successor (1080-1103), further increased his dominions by the conquest of Tarantasia. Amadeus III (1103-49) received from the Emperor Henry V the title of Count of Savoy in 1111; and his grandson, Thomas I (1188-1233), who supported Frederick II in his contest with the popes, obtained important accessions in Chambéry, Turin, Vaud and other lordships. Amadeus IV (1233-53), like his father a warm adherent of the emperor, obtained the submission of the city of Turin to his rule, and ceded Piedmont to one of his brothers, Thomas, Count of Maurienne. He was suc-

ceded by Boniface (1253-63), and Boniface by his uncle, Peter (1263-68), who reconquered Turin, which had rebelled. His nephew, Amadeus V (1285-1323), now mounted the throne; he assisted Philip the Fair in his war against Flanders, and accompanied the Emperor Henry VII to Italy. His grandson Amadeus VI aided the Greek emperor, John Palæologus, against the Turks and the Bulgarians and accompanied the pretender Louis of Anjou, in his expedition to Naples. His son, Amadeus VII (1383-91), forced the Count of Provence to cede to him Nice and Vintimiglia. Amadeus VIII, grandson of the preceding (1391-1451), received the ducal title from the Emperor Sigismund in 1416, acquired the county of Geneva, together with Bugey and Vercelli, and re-annexed Piedmont. Louis, who on the abdication of his father had governed as regent, assumed the title of duke in 1440. The elder male line becoming extinct in 1496, the crown devolved on the nearest collateral heirs, Philibert II (1496-1504), and his brother Charles III (1504-53). The latter aided the Emperor Charles V against Francis I of France, and after losing Valais and Geneva, which joined the Swiss Confederation in 1533, and the canton of Vaud, seized by the Bernese in 1536, he was finally deprived of all his territories by the French king. But his son Philibert Emmanuel, surnamed the Iron Head (1553-80), commander-in-chief of the Spanish army, succeeded in gaining back the greater part of the paternal domains by the treaties of Câteau-Cambrésis (1559) and Lausanne (1564). In 1560 he was induced by the courts of Rome, Spain and France to attempt the conversion of the Waldenses by force, but they offered such vigorous resistance to his troops in several encounters that he granted them, under certain conditions, the free exercise of their religion (5 June 1561). Charles Emmanuel I (1580-1630) was defeated by Henry IV of France, who invaded Savoy and Piedmont. His son Victor Amadeus I speedily regained the possessions his father had lost, and added to them Montferrat, Alba, and some other places, surrendering to France in exchange Pignerol, La Perouse, Angrone and Lucerne. His younger brother Thomas was the founder of the line of Savoy-Carignan. Victor Amadeus II (1675-1730), grandson of the first of that name, at the beginning of the war of the Spanish Succession, sided with France; but bribed by brilliant offers, allied himself to Austria by the Treaty of Turin, 25 Oct. 1703. The victories of the Duke of Vendôme compelled him to retire to Genoa, but the defeat of the French under the walls of Turin by Prince Eugene (7 Sept. 1706) restored his possessions. In 1709 he severed the Austrian alliance, and remained neutral until the end of the war. By the Treaty of Utrecht (1713) he received a part of the duchy of Milan, with the island of Sicily, which conferred upon him the title of king. In 1720 he was compelled to give up Sicily to Austria in exchange for Sardinia, which with Savoy, Piedmont and his other continental dominions, were erected into the kingdom of Sardinia. Consult Wiel, 'The Romance of the House of Savoy' (1901).

SAVOY, Military Order of. See ORDERS, ROYAL.

SAVOY, or **SAVOIE**, sā-vwā, France, consists of two eastern departments, Savoie and Haute-Savoie, formed in 1860 out of the former duchy of Savoy, one of the states of the Sardinian monarchy (q.v.); it covers an area of 4,162 square miles (2,368 in Savoie and 1,774 in Haute-Savoie), and is exceedingly mountainous. The region is separated from Switzerland by Lake Geneva and is dominated by Mont Blanc, the loftiest peak of the Alpine chain, whose many ramifications extending in all directions present a relief of successive mountains and valleys. Savoy belongs to the Rhone basin, which forms its western boundary. The other rivers are the Arve, Isère and Arc. The chief lakes besides Geneva are those of Bourget and Annecy. The climate is, generally speaking, cold. Savoy is rich in mineral waters, of which the most famous are those of Aix-les-Bains (hot-sulphur), Marlioz, Challes (strong natural sulphur), Salins-Montiers (hot, saline, various minerals), Brides-les-Bains (soda, calcium). The extent of arable ground is limited, but a scarcity of grain is supplied by the chestnut which forms a staple food among the peasants and the poor. The vine is somewhat cultivated in the lower valleys and slopes. The main source of profit is in the cattle and dairy produce, as hay and pasture alone are obtained from much of the land. The forests, which cover vast mountain slopes, also afford a rich supply of timber. The minerals are not sufficiently exploited to be of any importance. The manufactures are coarse woollens, linen and cotton goods, felt hats, leather and hardware. Other industries are silk, tanning and weaving. There is an important transit trade carried on between France and Italy, by way of Mont Cenis. Coal, skins, cotton, provisions are imported; cattle, dairy produce, wood, stones, mineral waters, silk goods, tanned leather and paper are exported. There are some schools, all speak French and they are exclusively Roman Catholic. The University Academy is at Chambéry, and clock-making is taught in two special schools at Annecy, employing 2,000 hands. (Here is also a large cotton mill). The inhabitants are industrious, honest, hospitable and intelligent; their chief characteristic, however, is love of country. Though often compelled to leave their homes for winter employment, wandering through France, Switzerland, Spain, or Italy, in order to earn a livelihood, they return to their native mountains at the earliest moment. Sardinia ceded Savoy to France in 1860. It was formed into the two departments of Savoie and Haute-Savoie, whose capitals are respectively, Chambéry and Annecy. Pop. Haute-Savoie 255,137; of Savoie about 248,890; total, 503,027.

SAVOY CABBAGE, a variety of cabbage (q.v.) with many sub-varieties, forming large close heads with wrinkled leaves, and cultivated for winter use, requiring a light, rich soil.

SAVOY CONFERENCE, a conference held in 1661 at the Savoy Palace, London, between a number of Church of England and Presbyterian divines for the purpose of 'advising upon and reviewing the Book of Common Prayer; and of taking into serious consideration the several directions and rules, forms of prayer, and things in the same book;

of consulting also upon the several objections which shall now be raised against the same; and, if occasion need be, to make such necessary and reasonable alterations, corrections and amendments as shall be agreed upon to be needful and expedient for the giving satisfaction to tender consciences, and the restoring and continuing of peace and unity in the churches under his majesty's government and protection." When the Parliamentary cause triumphed in the civil war of 1642-46 the majority of the clergy, who were royalists, were either turned out of their pulpits and their places were filled by Presbyterians, then a strong body in England; and at the Restoration of Charles II a large number of the ministers connected with the church strongly objected to Episcopalian order and practice being again introduced. The government was fully aware of this state of matters, and it was accordingly resolved that the determination of all matters appertaining to the establishment of unity should be left to the advice of a national synod. On 25 March 1661, therefore, the letters-patent above quoted from were issued, appointing 12 bishops, with nine clergymen as assistants on the Episcopal side, to meet with an equal number of Presbyterian divines and discuss the matters therein mentioned. The commissioners met for the first time on 13th April. Sheldon opened the discussion by observing that the Episcopal party, being perfectly satisfied with the established forms of worship, had nothing to propose, and would therefore expect that any objections to the existing order of things, and any innovations that might be desired, should be mentioned by their opponents. The Presbyterians moved that Bishop Ussher's Reduction of Episcopacy, a scheme in which the elements of the Scotch system of presbyteries, synods and general assemblies were combined with distinctions of ecclesiastical ranks, should be laid down as a ground-work to treat upon. They further offered several exceptions to the liturgy, against the many responses of the people, and desired that all might be made one continued prayer. They objected to lessons being taken out of the Apocrypha, and wished that the psalms used in the daily service should be according to the new translation. They excepted to many parts of the baptismal service that infer the doctrine of the regeneration of the baptized. They also moved that the practice of kneeling at the Lord's Supper, and that the use of the surplice, the cross in baptism, of godfathers as sponsors, and the celebration of the holy days, should be abolished. It was urged in reply to the demand for the adoption of Ussher's scheme, that the king's commission gave them no power even to take into consideration any questions relating to the government of the church; and the Presbyterians proceeded to discuss the minor points, mainly the alterations in the liturgy. Baxter undertook the preparation of what was called a Reformed Liturgy, but the Episcopalian commissioners rejected it at once, without examining it. The two parties finally separated at the end of four months, the period assigned by the letters-patent, without coming to a single resolution, and the government passed in the following year the famous act of uniformity, the stringent clauses of which drove about 2,000 clergymen from the Anglican Church.

SAVOY DECLARATION, the document uttered by the Independents and Presbyterians who met at the Savoy Hospital in London 29 Sept. 1658. In it these religionists declared the principles of their faith and polity. The Declaration is substantially the same as the Westminster Confession. See **CONFESSION OF FAITH, WESTMINSTER**.

SAVORY, aromatic herbaceous or half-shrubby plants of the labiate genus *Satureia*, native to the Mediterranean region and the Levant. They are cultivated in kitchen gardens. Summer savory (*S. hortensis*) is an annual with slender branching stems nearly a foot high, bearing soft, lanceolate leaves, often stained with purple, and with lilac or white mint-like flowers in the axils. The young shoots are plucked at flowering time, and dried for flavoring dressings, etc. Winter savory (*S. montana*) is a perennial species, with similar qualities.

SAW-FISH, a ray of the family *Pristida*, so called from the sword-like snout, the sides of which are armed with spines, so as to give it the appearance of a large doubled-toothed saw. Armed with this formidable weapon, which may measure two or three feet or more in length, the saw-fish is said to attack even whales, and to inflict severe injuries upon them, while it is certainly destructive to shoals of small fishes upon which the saw-fish subsists. The true teeth of the mouth are small, blunt, and arranged pavement-like. The mouth is situated on the under surface of the head, and the breathing apertures are large and set behind the eyes. The fins, tail and granular scales are shark-like in most respects. About five species are known, all inhabitants of the open ocean, whence they seldom approach the shore; and they prefer warm waters. A common species on the Gulf Coast of the United States is *Pristis pectinatus*, which sometimes enters the lower Mississippi or wanders northward on the Atlantic Coast; it is 10 to 20 feet long. The *Pristisphoridae*, which bears a similar weapon, are sharks.

SAW-FLIES, insects of the family *Tenthredinidae*, so called because the ovipositors are constructed of parallel, toothed blades with which the females cut holes in vegetable tissue to receive their eggs. Unlike the wasps, bees, ants and other members of the order *Hymenoptera*, the abdomen is united by its full girth to the thorax; that is, it is sessile. In general they resemble other members of the order in having two pairs of transparent wings with rather few veins and cells, biting mouth-parts, and a complete metamorphosis. The larvæ resemble caterpillars, but have at least six pairs of prolegs instead of five as do the larvæ of lepidopterous insects. They are also frequently slimy, and often they keep part of their bodies curved beneath the edge of the leaf upon which they are feeding. All feed upon living vegetable tissue, and some are troublesome upon cultivated plants. The currant-worm or slug (*Pteronurus ribesii*), a yellow bodied European insect, whose black-dotted green larvæ appear shortly after the leaves in spring, eat gluttonously for about three weeks and transform to adults below the ground. Two or three broods may appear in a season. The pear slug (*Eriocampoides lamacina*) is a slimy larva which sometimes

damages pear foliage. Rose slug, grape slug, raspberry slug, turnip fly and willow saw-fly are other well known species which occasionally do damage. In such cases they have been combated with an insecticide (q.v.) which must be eaten, though in some cases dust, forcible spraying with water, and other remedies have been reported effective.

SAW-MILL, a complete sawing machine, with all its adjuncts, for converting logs into planks, boards and slabs. The earliest form was the sawpit with raised trestle horses upon which the log was raised and then sawed by hand saws or by whip saws. Windmill power was applied about the beginning of the 13th century and was soon followed by water power.

All attempts to establish saw-mills in England during the period of 1660-1770 were unsuccessful on account of the opposition of the hand sawyers; but in the United States, beginning with the erection of the mill at Piscataqua Falls in the State of Maine in 1634 a vast number of mills have been built in all of the wooded districts of the country and by the development of improved methods in handling the logs, and in arranging the machinery, have made such States as Maine, Michigan and Wisconsin famous as lumber producing areas.

Of these mills the earlier forms are known as gate or sash saw-mills and consisted of two upright guide posts held in position by a transverse beam at the top. A heavy rectangular wooden frame carrying a straight band saw attached to the top and bottom pieces, worked with a vertical reciprocating motion in slides between the guide posts. The reciprocating motion was imparted to the sliding frame by a connecting rod, the lever end of which extended to one end of a water-wheel shaft. The carriage bearing the log was moved by a rack and pinion arrangement operated by a feed-wheel and the log was fed endwise to the saw, which was run, usually, at a speed of 150 strokes per minute and was capable of producing from 500 to 2,000 superficial feet of lumber per day of 10 hours.

A larger output was obtained by introducing the "gang" feature, which consisted of attaching several saws to the sliding frame. In the "Yankee gang," the saws were arranged in two sets, with the tooth edges of one set facing in a direction opposite to that of the other set, and enabled the sawing of two logs at one movement of the carriage. Other forms, designated "slabbing gang," "stock gang" and "pony gang," applied the method to special purposes.

The "muley" saw followed the gate and gang saws and was adopted generally by the smaller mills on account of the great reduction in the weight of the reciprocating parts. In this arrangement, the ends of the saw are attached to two light cross-heads opposite each other, which oscillate up and down. The saw is kept in line by means of slides working in a strong iron frame swung from an overhead beam. The cutting is accomplished entirely by the downward motion, during which the action of the slides causes the saw-teeth to hug close to the wood and then recede from it during the upward motion, so as to reduce the friction. Muley saws are driven at a speed of about 300 revolutions of the driving wheel per minute and are

capable of turning out about 6,000 superficial feet per day.

Saw-mills employing circular saws are of comparatively recent date. The experimental point in the use of the circular saw as the main saw of a mill was passed about the middle of the 19th century, since which time it has been developed to a state of very high efficiency and general usefulness. By its use a continuous cutting motion is obtained and driven by engines ranging from 25 to 100 horse power circular saws in connection with steam feeding arrangements are capable of sawing from 20,000 to 100,000 superficial feet per day, practically limited only by the capacity of the handlers to remove the lumber.

The saw, which is a disc of steel with a toothed edge, is mounted on a shaft which is rotated by gear wheels, or by belts operated by the shaft of a water wheel, steam engine, etc. The cutting depth of the saw is somewhat less than half the diameter of the disc and the saws generally employed rarely exceed a maximum diameter of six feet on account of the increased thickness required to obtain rigidity, and the consequent increase in the amount of the kerf or cut waste. Water power was used almost exclusively until 1835, but it has been almost completely supplanted by steam engines. "Band saws," although known a great many years before the circular saw, were not adopted until recent years on account of the difficulty experienced in making saws of sufficient endurance to withstand the severe service. During recent years, however, these difficulties have been overcome and they are now generally used in all of the great lumber producing countries.

The mechanical arrangement consists of two broad-faced wheels mounted one above the other. Over these wheels, a continuous band of steel, which is the saw, works like a belt over two pulley wheels, with a continuous motion, and the logs are fed endwise against the cutting or toothed edge by a traveling carriage. Mills employing band saws are capable of producing from 40,000 to 80,000 superficial feet of lumber per day and require from 25 to 45 per cent less driving power than mills employing circular saws. The latest thing in band saw-mills is a portable mill in which the log is stationary and the band saw, toothed on both edges, travels in guides lengthwise of the log, dropping the thickness of a board at each traverse and sawing at both the forward and return movements.

Many saw-mills employ both circular and gang saws. Both ordinary blade and band-saws are run in gangs and some band saws run on wheels as large as 10 feet in diameter. The mill is usually built upon the banks of a river or pond. The general construction is quite simple and consists of a saw floor and log deck built at an elevation of about 10 or 12 feet above the water level. A jack ladder constructed of heavy timber with its lower end resting on the bottom of the stream, leads up to the saw floor at the rear end of the mill. Ribbons of iron are fastened to the top sides of the ladder and form the track upon which the log car is operated. The arrangement and installation of the saws vary according to the size of the mills and the kind of work that is done. Since the depth of cut is less than

three feet, usually in mills handling logs of large diameter, increased depth of cut is obtained by mounting two saws one above the other, so that they cut in the same line—the upper one cutting down from the top of the log to the cut of the lower or main saw. In the mills in California, logs measuring up to 10 feet in diameter are sawed by arranging four saws one above the other, some cutting horizontally and others vertically, thus permitting the handling of very large trees.

The gigantic trunks of the redwood trees of California, Washington and other States on the Pacific Coast, ranging from 10 to 25 feet in diameter, are first quartered by explosions of gunpowder and then passed through the mills.

One great disadvantage in the use of circular saws is the excessive kerf waste, which is fully 20 per cent greater than that resulting from the use of the band or the gang saws, and is one of the principal reasons for the employment of the last named forms in the smaller mills where the uniform character of the lumber and the saving of raw material are important factors.

The majority of the American mills use single circular saws, but many of them have saws installed upon each side of the mill floor, and the logs are rolled to either side by the log jack placed in the centre of the building. In addition to these rotaries, the larger mills have from one to four gang saws.

The arrangements for handling the logs which are floated down upon the rivers from the distant forests to the mills, consist of piles driven at convenient distances apart, into the bed of the river adjacent to the mill, to which strong "booms" of logs, are attached by heavy chains and serve to hold the logs as in a pen, until they are required and also to leave a free channel in the middle of the stream. When the mill is in operation, the boomed logs are drawn from the water by an endless chain which runs in a V-shaped log slide and is provided with spikes to prevent the log from slipping back. The logs follow each other in endless succession. When a log reaches the log deck, it is loaded upon the skids by the action of a lever operated by the sawyer, which causes a pair of arms to rise through the mill floor and raise the log forcibly upon the skids. The skids lead to the log carriage, upon the "head blocks" of which the log is securely fastened by the insertion of a "dog," and it is then ready to be advanced to the saw. This is accomplished in several different ways—by rack and pinion worked by "cone feed," consisting of two parallel cones operating a belt which regulates the motion of the pinion shaft; by "rope feed," consisting of a wire rope which passes over pulleys set in the floor to a drum underneath, and is so arranged as to be under the control of the sawyer in the forward movement of feeding, or in the reverse movement of returning the carriage to its original position; or by "steam feed," commonly termed "lightning feed," derived from the force of a steam cylinder about 10 inches in diameter, which is laid upon the mill floor underneath the saw carriage to which the piston is attached. As the log is fed and when the first slab has been removed, the sawyer touches a lever and brings the "nigger," a piece of iron-bound timber with spikes upon its front face, through the floor. The spiked

face catches the side of the log and turns it axially at once, to any desired position. If the log is being "canted," or prepared for the gang saw, the slabs are removed from the two opposite sides, a hook is thrown over the rear end of the cant so as to prevent it from returning with the saw carriage, and it is dropped upon a set of rollers which starts it toward the gang. From the time that the log is drawn out of the water and until it emerges from the gang, all of the operations are performed by machinery.

The finished product of saw-mills are beams, planks, boards, etc., of varying sizes in length, breadth and thickness, too numerous to enumerate specifically; laths, consisting of strips four feet in length, three-eighths inch in thickness and one and one-half inches in width, used for lath and plaster work. The total production of the 31,833 saw-mills in operation in the United States, in 1900, was over thirty billion superficial feet, with a market value of about \$425,000,000. According to the United States census of 1900, these mills represent a total invested capital of \$805,785,236, and give employment to 229,710 workmen. The 1914 census does not afford figures for comparison.

For technical description of saws see **SAWS AND SAWING**; **METAL-WORKING MACHINERY**, and **WOOD-WORKING MACHINERY**.

SAW-WHET OWL, a small American owl (*Nyctale acadica*), which takes its name from the rough tone of its cry. It is northerly in its distribution, ranging across the continent, but rarely dwelling as far north as Hudson Bay. It is not so large as a robin and has inconspicuous ear-tufts; bill black; cere tumid; general color: above, chocolate brown, streaked with white; below, white with brown stripes. Its food consists mainly of insects and its nest is made in a hollow of a tree, in an old crow's nest or any convenient place. Compare **SPARROW-OWL**.

SAWBILL, a motmot (q.v.).

SAWDUST, a general name given the accumulated particles caused by sawing wood, stone, etc. Besides the more common uses of sawdust, it is commercially valuable as the basis of various manufactures. Oxalic acid is manufactured on a large scale from wood sawdust. Sawdust is also used in the "carbonating" stage of the process for the manufacture of soda ash. The sawdust of mahogany and rosewood is used in dressing furs and the small fragments of some woods, such as the pencil cedar, made by saw cuts or the turning tool, yield perfumes. Sawdust sinks in water, though the wood from which it is cut floats.

SAWS AND SAWING. A saw is a tool consisting usually of a thin, flat blade of highly tempered steel serrated or having a series of triangular-shaped teeth usually on one of the edges, but sometimes on both edges. It is one of the most important of the various forms of cutting tools and is extensively used for working wood, metal, stone and other substances, but principally wood.

Saws are made in a great variety of forms and sizes in order to adapt them to the varying characteristics of the material worked and to suit them to the particular kind of work for which they are used and also to suit the circumstances attending the manner in which they are operated or handled.

For illustration of power-driven saws see WOOD-WORKING MACHINERY.

In this article the consideration of the subject will be confined to the construction and adaptation of the various makes of saws for

FIG. 1.

specific purposes and to the identification of their generally applied trade names with those purposes.

The characteristic action of the saw being the removal successively of minute portions of the material worked by the cutting or tearing action of a series of sharp edges thrust against the material indicates that it is essentially a tool adapted for cross-cutting or cutting at right angles to the fibre of the material. Necessity and custom, however, have compelled its application for ripping or cutting with the grain also, thus adapting it to work which otherwise would be accomplished by the use of cutting tools such as axes and chisels. These conditions define two primary classes of saws—the cross-cut saws and the rip-saws which divide all the dif-

FIG. 2.

ferent kinds of saws into two groups according to the general purposes for which they are used.

Saw Terms.—The principal terms used in describing a saw are as follows: (See Fig. 1, Diag. A).

Space.—The distance between two contiguous teeth, measured from point to point.

Pitch or Rake.—The inclination of the face

of a tooth or the angle of the face of a tooth measured from a vertical line drawn through its point.

Gullet.—The depth of the tooth from the point to the root-line, the throat. Also the concave space at the back of a tooth.

Gauge.—The thickness of the blade, usually measured by the wire gauge.

Set.—The amount of lateral inclination

FIG. 3.

given to the teeth, either to the right or to the left of the plane of the blade, in order to produce a kerf or cut of sufficient width to effect a proper clearance of the sawdust and to prevent the saw from binding or being pinched by the sides of the cut.

Fleam.—The side angle of a tooth.

Points.—The number of teeth points to an inch. The coarseness and fineness of saws are usually estimated by the number of points instead of the number of teeth to an inch, and it should be observed that there is always one less tooth per inch than there are points. (See Fig. 1, Diag. B).

The several parts of a saw-tooth are usually described by the following terms: (See Fig. 1, Diag. A).

FIG. 4.

Face.—The front or cutting edge of the tooth.

Back.—The following or back edge of the tooth.

Point.—The lower end of the V between

saw-teeth; in another sense the outer cutting extremity.

Saw-teeth vary in spacing, length or depth of gullet, angle, pitch, set, fleam and form of

FIG. 5.

gullet. The teeth may be uniform throughout, or the blade may have several different kinds of teeth. In the latter case all the teeth of a kind are made uniform, or they are arranged in a regular order of change. (See Fig. 2).

The "angle" of a saw-tooth is that which is included in its point between the face and the back. The generic angle is 60 degrees, but it varies in the different kinds of teeth from 45 degrees to 70 degrees, according to the character of the material worked and the specific purpose for which the saw is used. The angle suitable for cutting soft wood and for ripping purposes is always more acute than that used for cutting hard wood and for cross-cutting. For soft wood, the front angle varies from 65 degrees to 70 degrees; for hard wood

FIG. 6.

from 80 degrees to 85 degrees. In saws employed for cutting very hard knotty wood, and in those used for cutting metal, the teeth are arranged in a series of equilateral triangles, the pitch of each tooth being evenly divided between the front and the back. In saws used for a general line of work, the angle usually adopted is 40 degrees, with the pitch evenly divided. In saws used for cutting soft woods and for ripping purposes, an effective placing of the angle is attained by making the face upright, and sloping the back. (See Fig. 3, Diags. A, B, C, respectively). The pitch of a saw tooth is obtained by subtracting the back angle from the front angle. These terms and rules apply generally to all the different kinds

FIG. 7.

of saws from the smallest hand and machine saws used by jewelers, machinists and carpenters, to the largest power-driven saws employed in the various classes of saw mills.

The various kinds of saws manufactured and used at the present time are of the following named general types:

The rip-saw, the hand-saw and the panel-saw. (See Fig. 4).

The carpenter's hand-saw for miscellaneous work is usually made from 20 to 30 inches in length, and is used for the common work of sawing material of moderate thickness both longitudinally and crosswise. The rip-saw and the panel-saw are modifications of the hand-saw, from which they differ in the size of the teeth, and in the length of the blade. The rip-

FIG. 8.

saws range from 28 to 36 inches in length, and the panel-saws from 12 to 24 inches. The usual spacing of the teeth of the three types is as follows: Hand-saws, 5 to 12 points per inch; rip-saws, three to five points at the heel or handle end, and six to eight points per inch at the point; and the panel-saws, 8 to 12 points to the inch. All three forms are made with a straight upper edge, or a "skewback" curve as shown in Fig. 5. A novel and useful form is represented by the "combination" saws. These are graduated along the upper edge, and sometimes furnished with a level attachment as

FIG. 9.

shown in Diag. A, Fig. 7. Other useful modifications of the hand-saw are the gauge-saw, the ship-carpenter's saw, and the movable-back saw, shown by Diags. A, B, C, respectively, of Fig. 7. The gauge-saw is equipped with a movable attachment by means of which it may be adapted to tenoning, shouldering, curving, cog-cutting or to any other purpose where a definite depth of cut is required. The movable-back saw combines the advantages of a thin-bladed hand-saw and a first class back-saw. The ship-carpenter's saw has a very long narrow blade and is especially suitable for cutting sweeps or curves of long radius. It is handled like the rip-saw, and is extensively used by cabinet-makers, pattern-makers and others for work requiring a narrow saw.

The compass-saw and its modifications, the various form of keyhole-saw, which are also commonly known as pad-saws and socket-saws, are shown in Fig. 8, Diags. A and B, respectively. The blades of the compass-saws range from 10 to 20 inches in length, and taper from one-eighth inch at the point to two or more inches at the heel. They are used for cutting

curves and sweeps by hand and are sometimes called table-saws. The regular keyhole-saw and its modification, the pad-saw, are simply smaller forms of compass-saws, and are used for cutting curves of small radius, such as keyholes and other small holes in the central

FIG. 10.

portions of work. A saw of this type consists of a narrow blade which slides into a hollow handle or pad, to which it is secured in place by one or more set screws, only so much of the blade being drawn out as may be required by the character of the work. These saws are made both simply and in "nests." A nest of

FIG. 11.

saws consists of a handle and three interchangeable blades, one each of the keyhole or pad, the compass and the table or pruning-saws. (See Fig. 9, Diag. A). A very useful novelty in this line is the nest of saws designed for cutting square holes. In this combination, the keyhole and compass blades are fitted with an attach-

FIG. 12.

ment at right angles to the plane of the blade as shown at (C) Diag. B, Fig. 9.

The back-saws are a class of hand-saws characterized by deep thin blades stiffened with a metallic back as shown in Fig. 10. The principal forms are the mitre-box saw, the tenon-saw, the sash-saw and the dovetail-saw. The

last named has the thinnest blade, so thin that simple filing gives the teeth sufficient set. The blades of the others are somewhat thicker and require a slight amount of set. All back-saws are best used in a mitre box or in some other form of guide rest. In cutting, they should be held firmly with the least practicable expenditure of force in controlling their direction, and the cut should be commenced by placing the heel of the blade on the farthest edge of the work and then drawing the saw steadily toward the body of the operator. Back-saw blades range from 8 to 18 inches in length,

FIG. 13.

the number of teeth varying in number from 10 to 14 per inch.

The pruning-saws are of several kinds, the principal forms of which are shown in Fig. 11. They vary from a large form of compass saw to straight saws toothed on both edges as shown in Diag. A, and also to those with curved blades as shown in Diag. B, a form extensively used on the Pacific Coast. They are also made of narrow blades attached to metal frames, the shape of which produce a tapered combination which permits of the use of the saw in very narrow spaces. See Fig. 11, Diag. C.

The construction of the tapered pruning-saw places it on the dividing line between what may be termed the regular bladed saw and the frame saw. In the former, the pressure on the cutting edge is resisted by the rigidity of the blade itself, while in the latter the pressure is resisted by the distribution of the tension of the blade through the various parts of the frame. Of the frame saws, the most familiar are the wood-saws shown in Fig. 12, the butchers' saws shown in Fig. 13 and the hack-saws shown in Fig. 14. The last named is shown in its adjustable and extendable form, in which the frame may be lengthened or shortened to fit blades of varying length. The saw has a thin, narrow blade and equilateral triangular-shaped teeth. It is stretched between the upright portions of a wrought-iron or steel frame, the

FIG. 14.

requisite tension being imparted by means of a thumb-screw at the forward end. A handle is attached to the back end of the frame, which is usually grasped by the right hand of the operator, and the downward pressure imparted to the tool during the act of cutting by laying the left hand upon the back or top of the frame. This saw is extensively used by fitters and mechanics for cutting odds and ends of metal, and has now become one of the most important tools in a machinist's toolbox. For general work, the blades are made with 14 teeth to the inch, but those used for cutting tubing and thin metal are

usually made with a greater number of teeth, about 25 per inch, in order to prevent a free bite and to reduce the danger of stripping the teeth. As in the case of the file, the fineness of the bite depends upon the number of the teeth in contact with the work; therefore, the judgment of the operator usually determines the amount of pressure that should be applied to the saw to suit the varying conditions of the cut. As in the case of other cutting tools, experience teaches that a hack-saw will work more effectively under a pressure sufficient to make the tool bite freely, than when it is allowed to scrape and glaze the surface under a light pressure. In order to use a hack-saw properly, the blade should be strained in the frame to prevent its kinking, and the cutting strokes should be made uniformly at a rate not exceeding 40 per minute. The blades should

FIG. 15.

be as short as possible, so as to reduce the cost and the danger of breakage, and oil should *never* be used on the teeth as it decreases their cutting efficiency. The reverse is true in the case of wood-working saws. Hack-saw blades as regularly manufactured range from 6 to 18 inches in length. Those longer than eight inches for hand-saws and 12 inches for power-driven saws are seldom required. The rail-saw is a modification of the hack-saw, the height of the frame being increased to adapt it for large work, such as the cutting off of rails, large beams, girders, etc., and is found to be a very valuable tool for contractors. The frames are fitted to carry blades ranging from 9 to 18 inches in length.

The cross-cut saws employed for cutting timber and other large work are made in an

almost innumerable variety of forms and sizes both as to the blades and to the teeth. The "one man" saws, shown in Fig. 15, range from three to six feet in length. The particular saw illustrated has the famous "Great American" tooth, commonly known as the M tooth. Fig. 16 shows three forms of the larger saws. They range from 4 to 10 feet in length and are operated by two men, one at each handle. They are made with either curved or straight backs, but are always round-breasted, and differ in this respect from the drag- and pit-saws, in which the toothed edge is always straight.

Other saw terms are defined as follows: Arbor, the shaft, spindle or mandrel of a circular saw; crown-saw, the end of a cylinder having saw teeth arranged to cut out a round hole, called also a cylinder- or drum-saw; jump-saw, a circular saw made adjustable in up-and-down position; razor-saw, a hardened steel toothless wheel made thin for cutting stone, etc.; ring-saw, a band-saw set on guides to operate in a ring or circle; saw-back, the stiffening piece on the back of a band-saw; saw-bench, a bench fitted with guides, gauges, stops, clamps, fences, etc., for supporting and guiding work to be sawed; saw-gate, a frame in which gang-saws are set to stiffen them and prevent buckling, a similar device is termed a saw-hanging; saw-jointer, a mechanism for holding in position the blades of gang-saws while they are filed and set; saw-jumper, a device for spreading or setting saw-teeth; saw-table, the level surface on which the work is fed to a circular or band-saw that cuts through a gap in the table; saw-wrest, levered device for straining a saw-blade in giving the teeth a spring-set. The saw industry of the United States is mainly confined to about 100 factories, having 4,500 employees. In 1914 these produced a gross value of \$12,517,000, but more than half of this was the value of the steel and other materials used. The industry about doubled its production between 1899 and 1914. Illinois is

FIG. 16.

the leading State, followed by New York. See WOOD-WORKING MACHINERY; LUMBER INDUSTRY IN THE UNITED STATES.

SAWYER, sá'yér, Sir James, English physician: b. Carlisle, Cumberland, 11 Aug. 1844. He was educated at Queen's College, Birmingham, and at the London University. He is consulting physician to the Queen's Hospital at Birmingham, has held the chairs of pathology (1875-78), materia medica (1878-85), and medicine (1885-91), at Queen's College, Birmingham, and is the author of several important medical works. Among them are 'Floating Kidney' (1883); 'Ether in Medication by the Skin' (1890), and 'Causes and Cure of Insomnia' (1904); 'Dietetics of Diabetics' (1904); 'Longevity' (1905); 'Maladies of the Heart' (1908); 'Coprotasis' (1912), etc.

SAWYER, Leicester Ambrose, American clergyman and Biblical scholar: b. Pinckney, N. Y., 28 July 1807; d. 1898. He was educated at Hamilton College, studied at Princeton Theological Seminary, and in 1832 entered the Presbyterian ministry. After filling pastorates in New York and Connecticut, he became president of Central College, Ohio. In 1854 he withdrew from the Presbyterian denomination and joined the Congregationalists. He made a complete translation of the Bible, that of the New Testament being published in 1858, the prophetic books of the Old Testament in 1860 and some of the remaining books in 1864. In some respects he was a pioneer in modern Biblical criticism, having for one thing abandoned the doctrine of verbal inspiration. His works include 'Elements of Biblical Interpretation' (1836); 'Mental Philosophy' (1839); 'Organic Christianity, or the Church of God' (1854); 'The Reconstruction of Biblical Theories, or Biblical Science Improved' (1862); and 'Final Theology' (1879).

SAWYER, Sylvanus, American inventor: b. Templeton, Mass., 15 April 1822; d. Templeton, 25 Oct. 1895. His attention was early turned to invention, and in 1839 he engaged in business with his brother-in-law in Augusta, Me., and invented a steam-engine, a screw propeller and a car run by foot-power. His first big invention, however, was the machine for making chair-cane from rattan, first invented in 1843 and used in his factories after 1850. Sawyer then turned his attention to gun and rifle projectiles and made important inventions, his projectiles making the rifled cannon a practicality. He also invented in 1853 an arrangement by which shells would explode on impact, by use of percussion caps. These inventions were put into use and did great service against the Confederacy in the ensuing war. Other inventions, after the war, perfected the cast-steel rifled guns, the first battery of which he furnished. His other inventions include calipers and dividers, steam generator, sole sewing-machine, centring watchmaker's lathe.

SAWYER, Thomas Jefferson, American Universalist clergyman: b. Reading, Vt., 9 Jan. 1804; d. 1899. He was graduated at Middlebury College in 1829, and held pastorates in New York (1830-45 and 1852-61). Between these periods he served as principal of the Liberal Institute at Clinton, N. Y., in which he also taught theology. He was one of the founders

of Tufts College, Medford, Mass., where he became professor of theology. As an advocate of Universalist doctrine and as a scholarly controversialist he acquired a wide reputation. His discussion with Isaac Westcott was published under the title of 'The Doctrine of Eternal Salvation' (1854). He also published 'Who is Our God? the Son or the Father?' (1859), in which he controverted in particular some of the opinions at that period held by Henry Ward Beecher.

SAXE, säks, John Godfrey, American poet: b. Highgate, Vt., 2 June 1816; d. Albany, N. Y., 31 March 1887. He was graduated at Middlebury College and admitted to the bar in 1843. During 1850-56 he conducted the *Sentinel* at Burlington, Vt., and in 1856 became attorney-general of Vermont and deputy collector of customs. Removing to Albany, N. Y., he edited the *Evening Journal*. He was a conspicuous figure on the lecture platform and at scholastic anniversaries, where he often read his verse. His reputation as a humorous poet was considerable during the mid-century, his verses often appearing in *Harper's Magazine* and in the *Knickerbocker*. He published 'Progress, a Satirical Poem' (1846); 'Humorous and Satirical Poems' (1850); 'The Money King and Other Poems' (1859); 'The Masquerade and Other Poems' (1866); 'Fables and Legends of Many Countries' (1872), and 'Leisure Day Rhymes' (1875).

SAXE, Maurice, marshal of France: b. Dresden, 28 Oct. 1696; d. Chambord, near Blois, France, 30 Nov. 1750. He was a natural son of Augustus II of Poland. His military career was begun at the age of 12, and a few years later he was put in command of a cavalry regiment which took part in the war with Sweden. After the Treaty of Utrecht he attached himself to the army of France, and in 1720 was made camp marshal to the Duke of Orléans. He was offered the command of the Saxon army at the death of his father but chose to remain in the French service. For his defense of Alsace in 1743 he was created marshal of France. Carlyle has described his heroic conduct in the battle of Fontenoy, in his life of Frederick the Great. He was one of the most fearless but also one of the most dissolute men of his day. He wrote with a singular disregard of the rules of orthography a book on the art of war, entitled, 'Mes Réveries.' Consult Weber, Karl von, 'Moritz von Sachsen' (1863); Duc de Broglie, 'Maurice de Saxe et le Marquis d'Argenson' (1891-93).

SAXE-ALTENBURG, säks ält'en-bërg. See ALTENBURG.

SAXE-COBURG-GOTHA, kô'bërg gô'ta, Germany, comprising the provinces of Gotha and Coburg, constitutes one of the central states of the republic, containing an area of 764 square miles. It lies on the south side of the forest of Thuringia. Its principal rivers are the Apfelstedt, Gera, Leina-Horsel, Nesse and Unstrut, in Gotha, and the Itz, Rodach, Lauter and Steinach, in Coburg. Both parts are mountainous with undulating and fertile tracts. The highest summits are the Great Beerberg (2,850 feet), the Schneekopf (2,829), and the Inselberg (2,655). The government is a constitutional monarchy. The educational institu-

tions are gymnasiums at both Gotha and Coburg; Salzmann College at Schnepfenthal; commercial school, Gotha; teachers' seminaries and technical schools in both towns; deaf and dumb institute, Coburg; and an observatory near Gotha. The Lutherans predominate. The chief occupations are agriculture and cattle-raising, especially in Coburg. The products are grain, peas, beans, hops, hemp, flax, potatoes (principal article of food) and wine. The forests yield timber, pitch, charcoal and potash. The chief manufactures include machinery, fire-proof safes, nickel goods, rifles, papier-maché, tobacco, pipes, watches, toys, needles and pottery; besides textile button and paper industries. There are also numerous breweries, distilleries, tanneries, bleaching establishments and saw-mills. The chief exports are grain, butter, fat, cattle, leather, wood, linen and other manufactured goods. Ruhla is celebrated for its meerschäum pipes and cigar holders, which are exported to all parts of the world. Inselberg, Schneekopf, Ruhla and Friedrichroda are picturesque towns and summer resorts; Neudietendorf or Gnadenthal is a Moravian settlement founded in 1742. The state returns one member to the Bundesrat and two to the Reichstag. The elder line of Saxe-Coburg was founded in 1680. The Duke of Albany, grandson of Victoria of England, succeeded to the duchy in 1900. Pop. 216,128, Protestants greatly preponderating.

SAXE-MEININGEN, mī'nīng-ĕn, or **SAXE - MEININGEN - HILDBURGHAUSEN**, hild'boorg-how-zĕn, Germany, a central state of the Republic, in Thuringia. It belongs to the basins of three great rivers, the Weser, Rhine and Elbe; is hilly, and covers 953 square miles. The ridges on the north belong to the Frankenwald, on the east to the Thüringerwald and on the west to the Rhöngebirge. The highest summits are the Kieserle and the Bless, respectively 2,851 and 2,834 feet high. The high land is interspersed by fertile valleys, watered by the Werra and various tributaries of the Main and the Saale. There are several small lakes and some mineral springs. The soil is not very productive; in the higher districts it is unfitted for cultivation, but well wooded. The best land is in the valleys of the Werra and Saale. The chief crops are rye, oats, barley, potatoes and wheat. Hops, flax, tobacco and some wine are also grown in sheltered localities. The pastures are good, so that stock-raising is important. The chief minerals are roofing slate, salt and iron. There is a brisk manufacturing industry, especially in Sonneberg, Gräfenenthal and Saalfeld. The principal articles include various kinds of hardware, glass and pottery, school-slates, marbles, all kinds of ingenious wooden and pasteboard objects, especially toys; and there is also a small textile industry. The principal exports, outside of the articles just mentioned, are wood, salt, wool and cattle. The schools include gymnasias, a normal college, technical schools, etc. The capital is Meiningen. The government until the collapse of the Empire in 1918 was a hereditary and limited monarchy. The line of Saxe-Meiningen was founded by Duke Bernhard, son of Ernst I of Saxony, friend and companion of Gustav Adolf of Sweden. Two-thirds of its present territory

was added in 1826. In 1866 it sided with Austria. A compromise in 1871 terminated the long dispute, dating from 1826, concerning the respective rights of the duke and the Diet to the state lands. The state under the Empire sent two members to the Bundesrat and three to the Reichstag. Saxe-Meiningen entered the North German Confederation with the other states. In 1918 it became a component state of the German Republic and in 1919 adopted a Republican Constitution. Pop. 278,762, mainly Lutherans.

SAXE-WEIMAR, vī'mār, or **SACHSEN-WEIMAR-EISENACH**, ī'zĕ-nāh, Germany, a central state of the new Republic, the largest of the Thuringian states, consisting of three large and 24 smaller divisions, the former comprising Weimar, Neustadt and Eisenach. The entire area comprises 1,388 square miles. The state is of circular form, with undulating surface and fertile soil. The Ilm, Saale and Unstrut are the principal rivers. The chief towns: Weimar, the capital, on the Ilm; Jena (with the general University of Thuringia), on the Saale; and Apolda, in the west. Eisenach, the second division in size, yields the poorest crops, but contains fine forests and picturesque scenery. Its chief streams are the Werra, Hörsa and Ulster. Its highest summits are The Hohe Vogelheid, Glockner, Ringberg and Ottowald; the Hohe Rain, Elnbogen, Bayerberg and the Glaserberg. Eisenach is the only considerable town. Neustadt has no especially interesting features; its principal rivers are the White Elster, Weida and Orla. Neustadt, Auma and Weida are the chief towns. The chief occupation is agriculture in all parts of the state, and stock-raising is carried on to some extent. The manufacturing industries are important and include textiles, especially woollens, pottery, scientific instruments, pipes, tobacco, leather, cork, paper and glass. The chief imports, besides colonial goods, are raw wool, hides, coal, meerschäum (from Smyrna and Vienna), amber, horn, etc. The chief exports are timber, wool, gin and dried fruit. The chief centres of trade are Eisenach and Weimar. There are numerous breweries. The minerals are silver, copper, iron, manganese; besides salt and potters' clay. The government until 1918 was a limited hereditary monarchy and was constitutional. By becoming a component state of the German Republic, a Republican form of government was obligatory. A constitution was adopted in 1919. Most of the inhabitants are Lutherans, distinguished for their industry and intelligence.

The reigning family of Saxe-Weimar under the Empire was the oldest branch of the Ernestine line, thus of the Saxon house. Weimar in early times was the seat of a line of counts; it finally fell into possession of Frederick the Mild of Saxony, and did not acquire historical independence until 1640. Later it was split into several factions, but became reunited under Ernest Augustus. The reign of Charles Augustus, his grandson, marks the most brilliant epoch in the history of Saxe-Weimar. Goethe, Schiller and Herder were members of the illustrious literary society which Charles Augustus gathered about him, and the University of Jena became a focus of light and learning. This prince granted the duchy a constitution, and freedom of the press. In 1866 the

grand duchy joined Prussia against Austria, and later entered into the North German Confederation. See GERMANY; WAR, EUROPEAN. Pop. 417,166.

SAXHORN. See HORN.

SAXIFRAGE, a plant of the typical genus of the family *Saxifragaceæ*, the name arising from an old Roman notion that the plants, which they often saw growing in cracks in rocks, had split the rocks themselves, and applying the doctrine of signature (q.v.), they concluded that the saxifrage would also break up stones in the bladder. The many species of saxifrage are found chiefly in the north temperate and arctic zones, increasing in number northwards; they are also characteristic of sub-alpine and alpine floras. This northern and mountain habit has made them valuable for rock-gardening, especially as the Alpine species have comparatively large flowers. The species are easily propagated by stolons and offshoots. Saxifrages are closely allied to the *Rosaceæ*, and have numerous regular flowers, mostly in corymbs or panicles, and white, yellow, or pink in color. The individual flowers are generally small, five-parted, with a two-celled ovary, becoming a small two-beaked pod with many seeds.

The London Pride (*Saxifraga umbrosa*) is much cultivated in European gardens, and sends up from a rosette of thick glabrous leaves small pink flowers panicked on a stem nearly a foot high. The purple saxifrage (*S. oppositifolia*) is one of most widely distributed species of Alpine and Arctic floras, and one of the first to bloom. It extends as far southward in the United States as Vermont, and carpets the rocks with its evergreen mats of thick foliage, nearly covered with solitary lilac blossoms. The most familiar saxifrages in eastern America are *S. virginensis* and *S. pennsylvanica*. The former is one of the first spring plants to bloom. It grows in rock-crevices and begins to open its small white flowers, while they are still close to the rosette of spatulate leaves. As the spring advances, the naked, pubescent flower scape elongates until, in fruit, it is perhaps a foot high and branched in a loose panicle. The swamp saxifrage (*S. pennsylvanica*) is a little later in blooming, larger and frequents swamps and wet banks; it has greenish flowers in panicles, and oval to oblanceolate leaves.

SAXO-GRAMMATICUS, sāk'sō grā-măt-ī-kūs (that is, Saxo the Grammarian, or the Learned), early Danish historian: b. about 1140; d. Roeskilde, about 1206. He was a native of Denmark, of which kingdom and its dependencies he compiled history down to 1186 under the auspices of Absalom, bishop of Roeskilde, whose secretary or chancellor he appears to have been. This work, 'Historia Danica,' is written in good correct Latin, which Erasmus has praised, and occupied 20 years in its composition. Saxo chose as his models the later Roman historians, especially Valerius Maximus, yet in some of his expressions and in his mode of representation he is quite mediæval, though he stands at the head of his class. The work is divided into 16 books, the earlier of which give a highly colored and imaginative account of ancient Danish history as learned from tales and traditions and is full of living pictures of

old heroic wars and adventures; the first nine books can scarcely be looked upon as reliable history, but when the writer approaches his own time his history is of the greatest value.

SAXON, the name of a Teutonic race, which took part with the Angles in founding Anglo-Saxon dominion in Britain, and which until a recent period was an important power in Germany. The Saxons (German *Sachsen*) were a warlike people, somewhat given to piracy, and during the existence of the Western Empire a thorn in the side of Rome. Charlemagne subdued them and caused them to become Christians. After the extensive Saxon emigration to Britain in the 5th century, those who remained in Germany were known as "Old Saxons." The dukedom of Saxony was for a time the most powerful of the German states and Duke Henry in 919 was elected German king, his son, grandson and great-grandson succeeding him in that dignity. The duchy afterward passed (1127) to the Bavarian branch of the Guelf family, of which Henry the Lion (q.v.), celebrated for his contest with the emperor, was a member (1146-95). After several changes, which it is unnecessary to enumerate here, Frederick the Warrior, Margrave of Meissen and Landgrave of Thuringia, became (1424) Duke and Elector of Saxony. The union of these three countries rendered the Saxon elector one of the most powerful princes in Germany. After the death of Frederick the Good, son of Frederick the Warrior, Ernest and Albert, sons of the former, divided the family possessions between them (1485) and founded the Ernestine and Albertine Saxon lines, which still exist. The latter received Meissen or Misnia, and now constitutes the royal Saxon house. The former retained the electoral dignity and Thuringia. Ernest was succeeded in the electorate by his sons, Frederick the Wise (1486-1525), and John (1525-32). The former is celebrated as the protector of Luther, the promoter of the Reformation and the founder of the University of Wittenberg. By the Wittenberg capitulation (19 May 1547) the electoral dignity was transferred to the Albertine line in the person of Maurice. The Ernestine house is now divided into the two branches of Weimar and Gotha, the latter of which consists of the three lines of Meiningen, Altenburg and Coburg.

The duchy became a kingdom under Frederick Augustus I, who paid by the loss of a large part of his dominions the penalty for taking the side of Napoleon in the struggle between France, on the one side, and Russia, Austria, Prussia, England and Sweden on the other. Saxony made another expensive blunder when it allied itself with Austria against Prussia in 1866, when the kingdom was spared on condition of paying 10,000,000 thalers to Prussia and entering the North German Confederation. In the war of 1870 against France the Saxons were on the side of Prussia and the feeling between the two courts has since been cordial. The Saxon people have ceased to be distinct from other Germans and national patriotism has taken the place of sectional jealousy. The Saxons possess the virtues without the faults of their distant ancestors and are noted for industry, frugality and thrift, while the average of comfort among the industrial and

agricultural classes is as high as in any part of Europe. See GERMANY; SAXONY.

SAXON ARCHITECTURE, the stage of early English architecture which preceded the Norman. The relics left us of this style exhibit its general characteristics as having been rude solidity and strength. The walls are of rough masonry, very thick, without buttresses and sometimes of herring-bone work; the towers and pillars thick in proportion to height, the former being sometimes not more than three diameters high; the quoins or angle masonry are of hewn stones set alternately on end and horizontally ("long-and-short" work); the arches of doorways and windows are rounded, or sometimes these openings have triangular heads, their jambs of long-and-short work carrying either rudely-carved impostes or capitals with square abaci. Sometimes heavy moldings run round the arches and when two or more arches are conjoined in an arcade these are on heavy low shafts formed like balusters. Window openings are often splayed both from the inside and from the outside and the windows themselves are small. On the outside of towers, walls, etc., there are often found slightly projecting pilaster-like shafts, usually formed of the long-and-short work characteristic of the quoins. See ARCHITECTURE.

SAXONY, sāk'sn-ī (German, SACHSEN, zāk'sēn), a state of central Germany, fifth in area and third in population of the states of the German Republic. It is surrounded by Prussia, on the north; Bohemia, south; Bavaria, southwest; Reuss, Saxe-Weimar and Saxe-Altenburg, west. It covers an area of 5,787 square miles, has the form of a right-angled triangle and lies mainly within the basin of the Elbe. It belongs to the central mountain region, only the districts near Leipzig and along the northern border sloping into the great north European plain. This tract is covered by peculiar and interesting sandstone formations. The chief mountain ranges are the Erzgebirge and Elstergebirge, along the southern border. The mountains of Upper Lusatia (2,600 feet) rise in the southeast, connecting with the Riesengebirge. That portion extending from Bohemia to Pirna on either side of the Elbe is wildly picturesque, hence the name "Saxon Switzerland." The highest summits in these mountains are no more than 2,000 to 2,500 feet high. The Fichtelberg in Oberwiesenthal (3,700 feet) towers above them all. The lowest point in the country is found where the Elbe enters Prussian territory, between Strehla and Mühlberg. The loftiest summits consist generally of sandstone and gneiss and are rich in mineral deposits; as the mountain ranges divide and merge into lower extensions, fertile valleys and plains are formed, suitable to agriculture. Most of Saxony belongs to the basin of the Elbe. At the east this river receives only minor affluents, but on the west has several important tributaries, the chief of which are the Mulde and Elster, themselves formed by the junction of smaller streams. The lakes are numerous, particularly in the north, but insignificant. Mineral springs are numerous; the chief are Bad Elster, Augustusbad, Neustadt, Warmbad (near Wolkenstein), Schweizermühle, Wiesenbad, Hohenstein, Marienborn, Tharandt, Grünthal (sulphur and iron), etc.

The climate in the higher districts, called Voigtland, is cold, otherwise analogous to other countries of Europe in similar latitude. Some marshy tracts on the Elbe and Pleisse alone are unhealthy. The Erzgebirge is that in which most rain falls. Leipzig enjoys the driest climate. Saxony is one of the most fertile parts of Germany, yet poor as compared to fertile soils elsewhere. Agriculture was long fettered by ancient customs, a condition no longer existing, and every inch of land now is developed to its utmost capacity. Sheep-farming has declined; cattle-raising is important. The forests are extensive; the mines, the oldest in Germany, are, with manufacturing, the chief sources of wealth. The principal crops are rye, and oats, potatoes (Voigtland), beets (for feed) and flax (Erzgebirge and Lusatian mountains). Enormous quantities of cherries, plums and apples are produced in the vicinity of Dresden, Leipzig and Coldetz. Vineyards, chiefly interesting for their antiquity, are found on the banks of the Elbe near Meissen and Dresden. The chief mining districts are Freiberg, silver and lead; Altenberg, tin; Schneeberg, cobalt, nickel and ironstone; and Johanngeorgenstadt, ironstone and silver mines. Coal occurs near Dresden and Zwickau. Peat is abundant in the Erzgebirge, sandstone on the hills of the Elbe; fine porcelain clay occurs near Meissen. Precious stones are found among the southern mountains, such as jasper, amethysts, fine topazes, etc. The textile industry is very important. The chief manufacturing centres are Zwickau, Chemnitz, Glauchau, Meerane, Hohenstein, Camenz, Pulsnitz and Bishofsverda and the principal articles are cotton, woolen, linen, damask and lace goods; other industries are straw-plaiting, wax-cloth, artificial flowers, stone and earthenware and porcelain ("Dresden china," celebrated); pianos, leather, cigars, paper and all kinds of machinery, especially at Chemnitz and Dresden; printing presses, breweries and distilleries; the smelting and refining foundries, chiefly at Freiberg. Leipzig is the centre of trade, especially for furs and books. The principal exports are the produce of the factories and mines. Commerce has developed rapidly. Education in Saxony is highly cultivated, and its foundations of schools and universities of ancient date. The university and conservatory of music at Leipzig; the endowed schools at Meissen and Grimma; the mining academy at Freiberg and school of forestry at Tharandt, are best known. The art collections of Dresden, the capital of the state, are celebrated. The government until 1918 was a constitutional monarchy. The reigning family was Roman Catholic, but 94 per cent of the population is Lutheran. Saxony under the monarchy returned four members to the Bundesrat and 23 to the Reichstag. Under the new constitution of the German Republic, adopted in 1919, Saxony with the other states was obliged to adopt a Republican constitution, with a universal, equal, direct, and secret franchise on the proportional system. Freedom of conscience, the press, and of assembly are guaranteed.

The duchy was founded in 880, and in 1423 passed into possession of Frederick, Elector of Saxony. The Ernestine line was succeeded by the Albertine line, now occupying the throne.

erick Augustus embraced the Catholic religion (1697) to obtain the crown of Poland. The succeeding monarchs fought against the Poles for Poland and in the Seven Years' War joined their forces to those of Austria against France. After the battle of Jena, however, Frederick Augustus III, the Elector, and his army fought with Napoleon, who conferred on him the title of king. In 1807 and 1809, Saxony acquired large additions of territory. In 1813 was the scene of Napoleon's struggle with his allies. The battles of Lützen, Bautzen, Dresden and Leipzig were followed by the Congress at Vienna, when much of Saxon territory was ceded to Prussia (1814). A period of progress followed, interrupted by the Revolution of 1848-49. In the Austro-Prussian War (1866) Saxony sided with Austria and Prussia would have incorporated the kingdom, but Austria, supported by France, intervened and she was admitted into the North German Confederation. In the Franco-Prussian War, Saxony fought with the other German states against France. Albert (crown prince at that time) commanded the German army on the Meuse. See WAR, EUROPEAN; SAXONY. Pop. 4,806,661.

SAXONY, Orders and Decorations of. See ORDERS, ROYAL.

SAXOPHONE, the name of a group of wind instruments invented by M. Sax. They consist of a conical brass tube, sounded by a piece furnished with a single reed similar to that of the clarinet. They have 20 holes covered by keys and studs for the first three fingers of each hand and are all fingered alike.

SAXTON, Joseph, American inventor: b. Huntingdon, Huntingdon County, Pa., 22 Jan. 1799; d. Washington, D. C., 26 Oct. 1851. Having made his way to Philadelphia, he was there employed in watchmaking and engraving, and devised, as his first invention, an ingenious machine for cutting the teeth of chronometer wheels. In 1830-37, after having constructed an astronomical clock with compensating pendulum and original escapement and having been admitted to the Franklin Institute, he was in England, where in June 1837 he exhibited before the British Association a magneto-electric machine. Here he won considerable reputation as a maker of instruments of precision, constructing among others an apparatus that by which Wheatstone measured the velocity of electricity in its passage through a long wire. Upon his return to the United States he was made constructor and designer of the standard weighing apparatus in use at Philadelphia, and in 1843 began the construction of the standard balances, weights and measures to be presented to each State for securing uniformity. In 1851 he was awarded a gold medal for a large balance of precision exhibited at the London World's Exhibition of that year. He was also somewhat of a student of archaeology, geology and botany, and became a charter member of the National Academy of Sciences (1863). See the sketch by Henry in Vol. I of the 'Biographical Memoirs' of the National Academy.

SAXTON, Rufus, American soldier: b. Andover, Mass., 19 Oct. 1824; d. Washington,

D. C., 23 Feb. 1908. He was graduated from West Point in 1849 and in 1855 became lieutenant. He led a surveying party across the Rocky Mountains 1853-54, was on the coast survey 1855-59 and instructor in military tactics at West Point 1859-60. He was chief quartermaster on the staff of General Lyon in the Missouri campaign, participated in the West Virginia campaign under General McClellan in 1861 in the same position and filled a like post with General Sherman in his Port Royal expedition of 1861-62. He was commissioned brigadier-general of volunteers in 1862, and defended Harper's Ferry against General Jackson in 1862, receiving a medal from Congress in recognition of his services. In 1862-65 he was military governor of the Department of the South, was brevetted major-general of volunteers in 1865 and mustered out of the volunteer service in 1866. After the war he served as chief quartermaster in the various departments until 1888 when he was retired with rank as colonel and assistant quartermaster-general.

SAY, Jean Baptiste, zhōn bāp-tēst sā, French economist: b. Lyons, 5 Jan. 1767; d. Paris, 16 Nov. 1832. His early life was spent in England where he began a commercial career. The French Revolution called him to Paris, and his acquaintance with and interest in the social philosophy and political economy of his time to the staff of the famous *Courrier de Provence*, the journal of Mirabeau. He was afterward secretary to Clavière, Minister of Finance. At the close of the Revolution he conducted *La Décade*, a journal in which he presented with great clearness and ability the economic principles of Adam Smith, and such subjects as the public credit, the currency and taxation. He wrote 'Catechisme d'économie politique' (1815-18); 'Lettres à Malthus' (1820); 'Cours complet d'économie politique' (1828-30). Consult Guillaumin, 'Collection des économistes.'

SAY, Thomas, American naturalist: b. Philadelphia, Pa., 27 July 1787; d. New Harmony, Ind., 10 Oct. 1834. He was one of the earliest entomologists and is said to have discovered more species of the genus *Insectivora* than any naturalist before him. His contributions to natural science were contained in his reports upon his expedition to the coast of Georgia and Florida in 1818, and that as chief geologist to the United States Survey of the Rocky Mountain region under Major Long in 1819-20, and have been collected by later naturalists. He was one of the founders of the Academy of Natural Sciences in Philadelphia in 1812. In 1825 he joined Robert Owen in his communistic colony at New Harmony. Consult 'American Conchology,' edited by W. G. Binney (1858); 'American Entomology,' with memoir, edited by Le Conte (1859).

SAY AND SELE, sēl, William Fiennes, Viscount, English politician and colonizer in America: b. 28 May 1582; d. 14 April 1662. From his first appearance in Parliament he was generally of the opposition, which found in him a tactician and debater of considerable skill. During the constantly increasing restiveness under the government of Charles I, he was a prominent malcontent; at the opening of the Long Parliament held high place in the

Lords by reason of his identification with the popular party in the lower house; recruited a regiment for Parliament; but from 1647 advocated compromise, and at the king's death retired. On the restoration he was made lord privy seal. With Lord Brook and 10 other associates he obtained from Lord Warwick and the New England Company a patent for a large tract on the Connecticut (19 March 1632). A shipload of colonists was sent over and Saybrook (q.v.) was founded under the immediate direction of Lion Gardiner (q.v.). Say and Brook also purchased a plantation at Cocheco (or Dover), in the present New Hampshire. Say later abandoned these enterprises, the Cocheco estate being made over to Massachusetts and Saybrook being sold to Connecticut. Consult Palfrey, 'History of New England' (1858).

SAYBROOK, Conn., town in Middlesex County, at the mouth of the Connecticut River, on the New York, New Haven and Hartford Railroad, 29 miles east of New Haven. It was first settled at Saybrook Point by the English in 1635. The town was incorporated in 1667; since then several townships have been separated from the original town: these are Chester (incorporated 1836), Old Saybrook (1852), Centerbrook (added to Essex, 1859). The industries include a box factory and the manufacture of ivory goods, of augers, gimlets and other small metal articles. The town-hall contains all the official records of the original town of Saybrook. There is a public high school, established in 1892. The Collegiate School of Connecticut (now Yale University) was located at Saybrook from 1701-16. Pop. 1,907.

SAYBROOK PLATFORM, a declaration of principles adopted in 1708 by the Congregational Church synod at Saybrook; substantially the same as the Cambridge platform (q.v.).

SAYCE, sās, Archibald Henry, English Assyriologist: b. Shirehampton, near Bristol, 25 Sept. 1846. He received his education at Queen's College, Oxford, where he was graduated in 1868. He was elected a Fellow in the following year and became a tutor in 1870. In 1876 he was appointed deputy professor of comparative philology at Oxford, and since 1891 has occupied the chair of Assyriology in the same university. He was a member of the Old Testament Revision Company. He is an honorary member of the Asiatic Society of Bengal, the Royal Academy of Spain and the Anthropological Society of Washington. His larger and more important works are 'An Assyrian Grammar for Comparative Purposes' (1872); 'The Principles of Comparative Philology' (1874); 'The Astronomy and Astrology of the Babylonians' (1874); 'Lectures on Babylonian Literature' (1877); 'Introduction to the Science of Language' (1880); 'The Vannic Inscription Deciphered and Translated' (1882); 'The Ancient Empires of the East' (1884); 'The Origin and Growth of Religion as illustrated by the Religion of the Ancient Babylonians' (1887); 'Life and Times of Isaiah' (1889); 'The Higher Criticism and the Verdict of the Monuments' (1894); 'Early History of the Hebrews' (1897); 'Babylonians and Assyrians' (1900); and 'Assuan Papyri' (1906). The following popular works: 'The Monu-

ments of the Hittites' (1881); 'Assyria: its Princes, Priests and People' (1882); 'The Hittites' (1889); 'The Races of the Old Testament' (1891); 'Social Life among the Assyrians and Babylonians' (1839); 'The Egypt of the Hebrews and Herodotos' (1895); 'Murray's Handbook of Egypt' (1896); and 'Israel and the Surrounding Nations' (1898).

SAYLES, sālz, John, American jurist: b. Vernon, N. Y., 9 March 1825; d. Abilene, Tex., 22 May 1897. He was graduated from Hamilton College, Clinton, N. Y., but studied law in Texas, where he was admitted to the Supreme Court of his adopted State, and from 1853 to 1855 served in the Texas legislature. His first contributions to the literature of jurisprudence were published soon after the close of the Civil War, in which he served as brigadier-general in the Confederate army. In 1880 he became a professor of law in Baylor University, Texas. His writings include 'A Treatise on the Practice in the District and Supreme Courts of Texas' (1858); 'Treatise on the Civil Jurisdiction of Justices of the Peace in the State of Texas' (1867); and 'Revised Civil Statutes and Laws Passed by the Legislature of Texas' (1888).

SAYRE, Lewis Albert, American surgeon: b. Battle Hill (now Madison), N. J., 29 Feb. 1820; d. New York, 21 Sept. 1900. He was graduated from Transylvania University in 1839, and three years later from the College of Physicians and Surgeons in New York. He was made professor of orthopedic surgery in the medical college of Bellevue Hospital in 1861, and professor emeritus at its consolidation with the New York University in 1898. In 1854 he successfully performed the first operation in the United States for the removal of the head of the femur in hip-joint disease, and became known as the greatest American orthopedist. His original methods and his invention of instruments used in the treatment of deformed children made his name familiar to the entire medical world. He was the author of 'Practical Manual of the Treatment of Club Foot' (1869); 'Orthopedic Surgery and Diseases of the Joints' (1876), etc.

SAYRE, Stephen, American banker and patriot: b. Long Island, 1734; d. Virginia, 27 Sept. 1818. He was graduated from the College of New Jersey (Princeton) in 1757, became a merchant and banker in London, attained there considerable influence in political circles, but was committed to the Tower on an unwarranted charge of treason. The affair soon ended in his release; but his banking business failed as a result and he was compelled to withdraw from England. Subsequently he was private secretary to Franklin, went with Arthur Lee's embassy to Berlin and at Copenhagen, Stockholm and Saint Petersburg was successful in obtaining supplies for the furtherance of the cause of independence. He was an opponent of Washington's administration in 1795.

SAYRE, Theodore Burt, American novelist and playwright: b. New York, 18 Dec. 1874. He was graduated from the New York College of Pharmacy in 1892, but almost immediately began to write for the stage. In 1896 his 'Wife of Willoughby' was produced at the Lyceum

in New York, and in the following year his 'Charles O'Malley' at the Lafayette in Washington. These were followed, among others, by 'A Classical Cowboy' (1900); 'Edmund Burke' (1905); 'Eileen Asthore' (1906); 'O'Neill of Derry' (1907); 'The Wearing of the Green' (1910); 'Love's Young Dream' (1912); 'The Irish Dragoon' (1915), etc. He also produced the novels 'Two Summer Girls and I' (1898); 'The Son of Carleycroft' (1900); 'Tom Moore' (1902).

SAYRE, Pa., borough in Bradford County, on the north branch of the Susquehanna River, and on the Lehigh Valley Railroad, about 15 miles north of Tonawanda, the capital of the county, and 18 miles southeast of Elmira, N. Y. Sayre is in an agricultural region and near the coal fields of the State. The industries are connected chiefly with farm and dairy products. The chief industrial establishments are machine shops, stove fixture works, metal works, lumber and coal yards. There is considerable trade in the shipment of farm and dairy products and poultry. The borough has a high school, elementary schools, a public library and (1918) two national banks with combined capital of \$100,000 and resources of \$1,623,272. Pop. about 6,426.

SAYULA, sā-yoo'lā, Mexico, a town in the state of Jalisco, situated 55 miles south of Guadalajara. Agave and sugar are cultivated in the surrounding country, and the town has a thriving commerce. Pop. about 8,000.

SAZONOFF, sā-zō'nōv, **Sergi Dimitrievich**, Russian statesman: b. 1861. Entering the diplomatic service, he was second secretary at the Russian embassy in London from 1890 to 1894 and councillor of Embassy 1904-06. His skilful handling of the difficulties arising from the Dogger Bank incident in 1904 marked him for promotion. From London he went to Rome in 1894 as secretary to the newly-created mission to the Holy See, and in 1906 he returned to Rome as Minister to the Vatican. In 1909 he was recalled to Russia to assist M. Isvolsky, then Foreign Minister, whom he succeeded in 1910. A year later he exchanged views in Paris with the French government, and in 1912 visited the king of England. In the diplomatic crisis preceding the European War, M. Sazonoff appeared to be the only allied statesman who saw the one method of averting the impending conflict. In the words of Mr. G. Bernard Shaw, "One man among them keeps his head and looks the facts in the face. That man is Sazonoff, the Russian Secretary for Foreign Affairs" (*Current History*, Vol. I, p. 19). In a telegram from Saint Petersburg dated 25 July 1914 the British Ambassador, Sir George Buchanan, informed Sir Edward Grey of an interview with Sazonoff, in the course of which the latter said that "he did not believe Germany really wanted war, but her attitude was decided by ours" [the British attitude]. "If we [Great Britain] took our stand firmly with France and Russia there would be no war. If we failed them now, rivers of blood would flow, and we would in the end be dragged into war. . . . His Excellency said that unfortunately Germany was convinced that she could count upon our neutrality" (*British Blue Book*, dispatch No. 17). M. Sazonoff resigned his office in July 1916, and in January 1917 was appointed

Ambassador to Great Britain, but retired shortly afterward.

SBARETTI, sbā-rēt'tē, **Donatus**, Italian Roman Catholic prelate: b. Montefranco, Italy, 12 Nov. 1856. He was educated at the College of Saint Apollinaris, Rome, and was ordained in 1879. For eight years after his ordination he occupied the chair of speculative and moral philosophy in the College of the Propaganda, Rome, and subsequently served as subsecretary of the Propaganda in affairs concerning the United States. He was made private chamberlain to Leo XIII, with title of monsignore, and in 1893-1900 was the first to occupy the office of auditor of the Apostolic legation at Washington. He was consecrated bishop of Havana in 1900, appointed extraordinary Apostolic Delegate to the Philippines in 1901, titular archbishop of Ephesus later in that year, and since 1902 has been Delegate Apostolic to Canada.

SCAB, or **SCABIES**, a skin disease in sheep, analogous to the itch in the human subject and to mange in horses and dogs. It is caused by a parasitic mite, *Sarcoptes scabiei*. See **ITCH**.

SCABBARD-FISH, the name of certain pelagic fishes, allied to the mackerels, and so called because of their compressed and elongated shape. One is *Lepidopus caudatus*, rare in American waters, but known in the eastern Atlantic, Indian and south Pacific oceans. It is the "frost-fish" of New Zealand, where it comes ashore in the surf on moonlit winter nights, and is caught on the beach by men watching for it. It is a favorite food-fish and reaches a length of five or six feet, but weighs only about six pounds. Another is the cutlass-fish, silver-fish or hair-tail (*Trichiurus lepturus*), which attains a length of three feet or more, and whose tail ends in a filiform point without a caudal fin. It is found on the American coast from New England to South America, and is silvery, with a golden lateral line and grayish-yellow dorsal; the lower jaw is the longer, with two teeth projecting beyond the upper when the mouth is closed, and the whole armature of the jaws indicates carnivorous habits. It is rarely seen except when found benumbed with cold floating on the surface.

SCAD, a name given to several species of fishes of the family *Carangidae*; in the United States to *Decapterus punctatus*, a fish about a foot long found along most of our Atlantic coast and abundant southward, where it is a foodfish of some importance. In England the name belongs to the fish also called horse-mackerel (*Trachurus trachurus*) which appears in large shoals and is dusky olive on the back, the sides variegated by bands of bluish. It is also known as saurel, cigar fish, round robin, etc. A related species (*Trachurus crumenophthalmus*), common in the West Indies, and known on most tropical coasts, is called big-eyed scad.

SCÆVOLA, sēv'ō-lā, **Caius Mucius**, Roman hero and founder of the plebeian family of Mucii: lived about 600 years B.C. Livy tells how Caius Mucius, a young patrician, sought to kill Porsenna of Clusium, the protector of the expelled Tarquins, who was besieging Rome and had reduced the city to great dis-

treass. Mucius went to the tent of Porsenna to kill him, but mistaking his secretary for the chief plunged his sword into him. Porsenna, in rage, had Mucius brought before him, whereupon the young Roman expressed regret at not having killed Porsenna himself, and told him that other attempts would be made and would be successful. Upon Porsenna threatening to have Mucius burned alive if he did not betray the conspirators, Mucius thrust his right hand into a flame and held it there. Porsenna, in admiration for this fearlessness, ordered the young Roman freed, and the latter in return for his courtesy told Porsenna that 300 Roman youths had sworn to assassinate him or die in the attempt. This so alarmed Porsenna that he raised the siege and withdrew from Rome. Scævola, meaning "the left-handed," was the name bestowed upon Mucius in honor of his deed. Quintus Mucius, called "the augur," a Roman tribune, prætor and consul, d. about 100 B.C., and Quintus Mucius, called "the pontifex," Roman tribune, consul and pontifex maximus, d. 8 B.C., are descended from Caius Mucius Scævola.

SCATELL, ska-těl', or **SCAW FELL**, England, a mountain in the county of Cumberland, bordering on Westmoreland, 13 miles southwest of Keswick. It rises from the centre of the lake region, its two peaks reaching an elevation respectively, of 3,229 and 3,092 feet, making the mountain one of the conspicuous features of the scenery. It consists of granite with a superformation of slate, excepting the summit which is composed of trap porphyry.

SCAGLIOLA, skäl-yō'la, an Italian term for an imitation marble used in columns, walls and floors for surface decoration. It was invented by Guido del Conte in Modena in the early part of the 17th century. It is composed of plaster and glue mixed with splinters (scagliole) of spar, marble, granite, concrete, gypsum, veins of clay, etc., artificially colored and smoothed down and polished to a semblance of the quality of polished marble.

SCAIFE, Walter Bell, American author: b. Pittsburgh, Pa., 10 Sept. 1858. He was graduated at the University of Michigan in 1880 and subsequently studied at Johns Hopkins and at the University of Vienna. Since 1889 he has lectured at Baltimore, Pittsburgh, Washington and Boston on history and other subjects. He published 'American Geographical History, 1492-1892,' 'Florentine Life During the Renaissance,' 'A Dissertation on Law and History,' 'A History of Geographical Latitude' (1889); 'The Boundary Dispute between Maryland and Pennsylvania' (1885); 'The Public Schools of Geneva' (1895); 'Legislative Elections in France' (1898); 'A Century's Labor Legislation in France' (1899); 'Organized Labor in France' (1900); 'Work and Wages in France' (1900); 'Labor Conditions in Switzerland' (1901); 'Auto-Dominis' (in Italian, 1914); 'From Energy to Wisdom' (1917).

SCALA, La, lä skä'lä, Milan, Italy, a historic theatre and opera-house opened in 1778, with accommodation for 3,600 auditors.

SCALD-HEAD, an affection of the scalp, as ringworm of the head, etc., the term being

vulgarly applied to various disorders similar in nature. See **RINGWORM**.

SCALE, from Lat. *scala*, ladder or staircase, in music, the tone ladder marking the regular succession of intervals in any given key, from the keynote to the octave, and indicating the relative pitch of tones. See **MUSICAL ELEMENTS AND TERMS**; **MODE**.

SCALE INSECTS, certain species of the family *Coccidæ* (see *Coccus*). Some species of this family popularly called mealy bugs more often than scales, are readily distinguished by being free-moving, whereas the scales proper are stationary except for a few hours after birth or hatching. The males of the family are remarkable in having a complete metamorphosis (other *Hemiptera* have incomplete, and so do the females of this family), one pair of wings, a pair of hooks replacing the rear wings, and an extra pair of eyes in the adult, instead of mouthparts. The female has six legs when newly hatched, but after molting the legs are wanting and the insects are grub-like, stationary, wingless, and are concealed beneath a powdery, cottony or waxy secretion and the cast-off skins. On account of their appearance some of the species are called gall insects, a name more correctly applied to species of the family *Cynipidæ* and *Gallicolæ*, which produce nut-galls or galls.

The family embraces several species which have been useful to man for many centuries and also some that are troublesome upon cultivated plants. The scarlet grains of Poland are scale insects (*Coccus polonicus*) found on the roots of knawel and were formerly an important article of commerce, being used in dyeing various fabrics. Another species found on the roots of burnet has long been used by the Moors for dyeing wool and silk various tints of pink. Kermes or scarlet grain is the dried body of *Lecanium ilicis* which lives on the young shoots of the kermes oak (*Quercus coccifera*), a low evergreen shrub common from Spain eastward to India. In parts of this region this insect furnished a source of revenue to the people. The females grow about as large as peas and before the eggs are hatched, during May, they are gathered, dropped into vinegar, dried in the sun or in ovens, and sold. They have been used for ages to dye cloth a dark brownish-red, but except locally they are almost entirely superseded by cochineal. See *Coccus*.

Cochineal is a species (*Coccus cacti*) of the mealy bug group. It is a native of Mexico where it feeds upon certain species of cactus, especially the nopal (*Opuntia cochinellifera*), a kind of prickly pear (q.v.). It is also found in many regions where this plant has been introduced, notably in the Canaries, Java and the Mediterranean region, in some parts of which it has been cultivated. In Mexico pieces of the cactus covered with the insects are cut out at the close of the dry season and protected until the end of the wet season, when they are used for re-stocking the plantation in October. The females lay about 1,000 eggs, about 99 per cent of which produce females. In December the first crop is gathered and other harvests are made until May when the rainy season begins. The females are brushed off the water, or on hot irons, and dried. They usu-

ally lose more than half their weight in the process. A days' work is represented by about two ounces of dried insects—that is, more than 8,000! These insects have been used for dyeing scarlet and crimson, for which purposes they are unequaled, though coal tar products, being cheaper, more readily procured, and in greater variety, have largely replaced them. They are used also for manufacturing pigments such as lake and carmine (q.v.) and for coloring confectionery. See COCHINEAL.

Several other species have been used for dyeing, some being employed by the ancient Egyptians, Jews and Persians for giving the brilliancy or delicacy of tint to certain fabrics formerly highly valued by these nations and the peoples embraced in their commerce.

Other members of the family are noted for their wax, which is used in some countries for candles, varnishes, sealing wax, lacquer and many other purposes. The wax insect of China (*Coccus sinensis*) is a small white species which lives upon sumac and other trees upon the branches of which it deposits its secretion. This resembles hoar frost during June, but becomes somewhat darker and more continuous by August when it is scraped off and melted in boiling water. After straining and cooling it is ready for use. The French have introduced this species into Algeria. In South America another species is locally, but not commercially, important as a source of wax and in other countries are several species that might become similarly useful. But the principal species are the lac or shell-lac insects of Asia. See LAC.

Among the species considered troublesome upon cultivated plants perhaps the cottony cushion scale (*Icerya purchasi*) is perhaps the most noted in the United States. This is an Australian insect which was accidentally introduced into California where, being free from the conditions that held it under control in its native habitat it spread rapidly upon orange, lemon and other citrus trees to the dismay of orchardists. It was found that certain species of ladybird beetles (q.v.) play important rôles in checking the spread of this scale in Australia; so, some were imported in the hope that they would eradicate the scale in California. They did. The scale is now practically extinct in California and the lady-bird beetles, being deprived of their food supply, have followed it, since they seem to be unable to adapt themselves to other foods. This is one of the most remarkable instances of man's intervention to bring natural controls to his aid instead of resorting to artificial methods which are frequently cumbersome or unsatisfactory.

The armored scales of the sub-family *Diaspidinae* are generally of small size, but being exceedingly prolific and voracious are of ill-repute. They are generally flattened or slightly convex, covered with a parchment-like membrane, and are of many shapes. The larvæ are either hatched from eggs or are born. They crawl to a suitable place to feed, usually before they are a day old, and become fixed. They are tiny, flat, six-legged larvæ with a pair of feelers and with long sucking beaks. Soon waxy threads appear, coalesce and cover the creatures. After molting the larvæ are legless. After the second molt the males can be readily recognized, being a pupa with wings, legs and

antennæ visible; the females become still more grub-like. The male soon emerges, flies a short time, pairs and dies. In some cases the females hibernate, in others they lay eggs, in others bear young, sometimes there may be several generations in a season. Some of the best-known species are the oyster-shell scale, especially *Mytilaspis pomorum*, which is well known upon apple, lilac, willow and other trees. They are named from the shape of the scale, which resembles the shell of some kinds of oysters. This species winters in the egg, the young appear in May, and in the North there is only one brood; two in the South where the insects are believed to hibernate. A very similar species lives upon citrus fruits, and specimens may often be found upon oranges and lemons, especially those that come from the Mediterranean region. The San José scale (*Aspidiotus perniciosus*) is viviparous and enormously productive. It lives upon the woody members of the order *Rosaceæ*, for example, apple, cherry, rose and pear, and upon currants, gooseberries, elm, chestnut, oak, walnut and many other trees and shrubs. The scurfy scale (*Chionaspis furfurus*) is an oval scale with the cast skin at the small end and is frequently found upon apple and pear trees. The red scale of the orange is a close relative of the San José scale and is well known in California, Florida, etc. See ORANGE.

The cottony maple scale (*Pulvinaria innumerabilis*) is often found on Virginia creeper, grapevines, and some other plants, as well as on maples. It is a soft scale which is usually rather conspicuous in spring from its cottony appearance upon the young growths. The "cotton" is really a gum since it can be drawn out into cobweb-like threads. The black scale (*Lecanium oleæ*) is another soft scale which is well known to California olive and orange growers.

Several species of scale insects are found in greenhouses and nurseries devoted to ornamental plants. But they present no more remarkable features in life-history or habits than the preceding, and being of somewhat smaller importance need not be discussed specifically.

Where the natural controls seem to be inadequate to cope with the species various artificial methods have been tested to determine their efficacy. But in many instances these are so cumbersome, expensive, dangerous either to plant or operator, and difficult to apply intelligently, that they have been discarded. Spraying and fumigation are the principal ones in vogue. But it seems highly probable that in many instances the natural controls would hold the scales in check. Man has, however, not yet discovered these controls except in a few cases and in most of these has not made use of them more than experimentally.

Consult numerous bulletins of the agricultural experiment stations and the United States Department of Agriculture; also references under INSECTICIDE.

M. G. KAINS.

SCALE-TAIL, an African flying squirrel of the family *Anomaluridae*, distinguished from the true squirrels by dentition and various other peculiarities, and especially by the possession of a series of strong keeled scales at the root of the tail, which seem to serve as an aid

in climbing. There are several genera and species, of which the best known is *Anomalurus pedi* of the Gold Coast, which is black and white, and is regarded as a delicacy by the natives. The food and habits are similar to those of the northern flying-squirrels.

SCALES. See **BALANCE**.

SCALIGER, skāl'i-jēr, **Joseph Justus**, French scholar and author: b. Agen, France, 4 Aug. 1540; d. Leyden, France, 21 Jan. 1609. He was the 10th son of his learned father, Julius Cæsar Scaliger (q.v.), and received from him a fine classical education, as well as a boastful and arrogant nature. He studied Latin at Bordeaux, and Greek at Paris. According to Henisius, he shut himself into his room and committed the whole of Homer in 21 days; he memorized the rest of the Greek poets in three months and the entire body of Greek literature in two years. It was his boast that he was equally familiar with 13 languages. In his 22d year he was converted to Protestantism, a fact which probably retarded his advancement in France. From this period until 1578 he traveled extensively making a poor living from his teaching and writings, but refusing the money offered him by admiring patrons. In 1578 he became professor of belles-lettres at Leyden, a position which he held until his death. Joseph Scaliger's most important works are upon chronology. His 'De Emendatione Temporum' (1583) gave the first complete scientific chronology, and for this work, with his 'Thesaurus Temporum' (1609), and on account of his discovery of the Julian Period, he deserves to be called the founder of the science of chronology. He also annotated the principal works of the chief Latin writers.

SCALIGER, Julius Cæsar, Italian classical scholar: b. Riva, Lake Garda, 23 April 1484; d. Agen, France, 21 Oct. 1558. He is generally accepted as the son of Bendetto Bordoni, a miniature painter of Padua, but Scaliger claimed descent from the Scaligeri princes of Verona, as did his son, Joseph Justus Scaliger. The elder Scaliger, according to his own account, was a page of Emperor Maximilian for 17 years, then received a pension, studied at Bologna, commanded a squadron under the French viceroy, studied natural law, and in 1525 accompanied the bishop of Agen to his diocese in France where he settled as physician. In 1530 he married a lady of rank and from that time put forth pretentious claims as to his ancestry. He was a man of unusually great learning, a versatile Latin poet, but bold and arrogant, so that while his writings brought him admirers among the scholars of his day, his personal conduct gained him many enemies. His principal works include commentaries on the work of Hippocrates 'De Insamnis' (1538); of Aristotle, 'De Plantis' and Theophrastus, 'De Causis Plantarum' (1566); an attack on Erasmus, 'Oratio pro Cicerone contra Erasmum' (1531), 'De Causis Linguae Latine' (1540); 'Poetices Libri VII' (1561).

SCALLOP, a well-known bivalve mollusk. The scallops form a family (*Pectinidae*) related to the oysters, which they resemble in having a single adductor muscle. The genus *Pecten*, which in the wide sense is nearly coextensive with the family, has the following character-

istics: The shells are more or less orbicular, with an ear developed on each side of the umbo, making a straight hinge-line, generally ornamented externally with more or less developed radiating ribs. The hinge-teeth are lamellar, but usually small and obscure, the principal ligament is internal and solid, and the muscle-star is single. The mantle margins are open all around, reduplicated and, besides a fringe of tactile filaments, bear numerous conspicuous eyes of a brilliant blue or silvery lustre. These eyes are the most complex known among the *Pelecypoda* and consist of a nervous layer, a choroid coat, lens and cornea and receive an optic nerve from the circumpallial trunk. The gills are delicate and of peculiar structure, the foot small and papilliform and in the young has a byssus gland, and the genital ducts open into the kidneys or near their apertures. Only the posterior adductor muscle is present, and this is large, round, central, and remarkable from its constitution in part of striated and in part of nonstriated fibres. Scallops are remarkable, especially when young, for their activity, and swim in a peculiar jumping fashion by opening and powerfully closing the shell valves as though flying, thus forcing out the contained water and propelling themselves forward. As they become older and the shells heavier they are more quiescent. Fully 200 living and a still greater number of fossil species are known beginning in the Carboniferous strata. Perhaps 40 species occur in North American waters, the great majority southward and in moderately deep water. Several of our own and foreign species are of commercial importance, furnishing the well-known scallops of the markets. *P. jacobæus*, a native of the Mediterranean, is the scallop shell which pilgrims were accustomed to wear in front of their hat in token of having visited the shrine of Saint James at Compostella.

Although the richly colored and beautifully formed shells of the scallops are much used in fancy work of various kinds, these mollusks derive their commercial importance from the use of the muscle for food. Before the advent of the white man they were largely gathered for this purpose by the Indians. The principal fisheries are on the coast of Maine, in Long Island Sound, Buzzard Bay and contiguous waters, and on the coasts of New Jersey and California, the first two having the greatest magnitude. South of Cape Cod *Pecten irradians*, which has the shell marked with about 20 prominent radiating ribs on each side, is the species sought. This lives especially in the shoal waters of the bays or on flats in the Sound. Scallops vary greatly in abundance from year to year and the seat of the fisheries changes accordingly, some formerly favorite grounds being abandoned and others developed. The commercial scallop fishery of Maine originated about 1880 and has since developed into an important industry at many points east of Casco Bay. Here the giant scallop (*P. magellanicus*) is the species sought. This is much larger than *P. irradians*, and the valves are marked with numerous fine radiating lines, the lower valve being nearly flat and white and the upper convex and brown. This species lives in deeper water and like the other changes its feeding ground. Scallops are now taken almost exclusively in small dredges, resembling in most

features the oyster dredge, and pulled over the ground by means of small boats; larger vessels when used serve chiefly for transportation, etc. The fishing season varies; south of Cape Cod it covers the cold months, but about Mount Desert the bulk of the catch is made during July and August.

Consult Ingersoll, 'The Fisheries Industries of the United States,' Sec. V (Washington 1887); Smith, 'The Giant Scallop Fishery of Maine'; Bulletin United States Fish Commission 1889 (1891); Stearns, *Overland Monthly* (1873); Zittel and Eastman, 'Textbook of Palæontology' (Vol. I, London 1900); Risser, 'Thirty-first Report of the Commissioner of Rhode Island Fisheries' (Providence 1901).

SCALP, the outer covering or integument of the upper part of the skull or brain-case. Except in the fact that hair in both sexes grows more luxuriantly on the scalp than elsewhere the skin of the scalp differs but slightly from ordinary skin. But besides its constituent of skin, the scalp is composed of the expanded tendon of the occipito-frontalis muscle, and of intermediate cellular tissue and blood-vessels. Injuries of the scalp, however slight, must be carefully watched, for they may be followed by erysipelas, inflammation, suppuration or pyæmia that may easily prove fatal. Prompt antiseptic dressing lessens the danger in such accidents. In the treatment of scalp-wounds no part of the scalp should be cut or torn away; and, if possible, stitches should be avoided, as plasters and bandages will generally keep the separated parts in apposition. Burns of the scalp are very liable to be followed by erysipelas and diffuse inflammation, but the brain is comparatively seldom affected in these cases. Tumors of the scalp are not uncommon, the most frequent being the cutaneous cysts popularly known as wens, and vascular tumors. Parasitic diseases also affect the scalp, and require special treatment. Catarrhal inflammation of the hair-follicle and other hair-destroying diseases result from micro-organisms. See DANDRUFF; PITIRIASIS; RINGWORM.

SCALPER, a common term in the United States applied to any person who buys railroad, theatre or steamship tickets at a discount from people unable to use them, and sells them again at an advance on the price he paid for them. Theatres and transportation companies have devised various plans to break up this trade, and in some States laws have been passed forbidding the sale of railroad tickets at cut-rate prices.

SCALPING, the act of partly cutting and partly tearing off the skin of the head, with the hair attached, of a living or a dead victim. Scalping was practised in early times, by most of the savage and barbarous nations of the eastern hemisphere, as the Scythians, Gauls and other wild peoples of Asia and Europe, and later by the American Indians residing principally in the eastern United States and the lower Saint Lawrence region. It seems to have been unknown until comparatively recent times, in the great plains regions; and it was little practised among the Pueblo and other more cultured tribes of the United States. It was unknown south of the Rio Grande except where introduced by American tribes; and was absent from Central and South America. Nor was

scalping practised in the Canadian Northwest or along the whole Pacific Coast. Sometimes the entire head was taken in lieu of the scalp. After the scalp was taken, it was tanned and then stretched on a small hoop of wood, and the side opposite to that having the hair was painted in various colors, and even the hair was tinted likewise. Sometimes the portrait or the hieroglyphic device of the person scalped was placed on it. Persons scalped did not always die from the effect. Scalps were regarded as trophies of victory and prowess. Joutel relates that in 1687 among the Cenis of Texas, a scalp was waved or offered in ceremony to the four quarters of the world, and that tobacco and hominy were offered to the scalps that were paraded. In 1703, Bienville offered 10 "escus" (*écus*, about 10 crowns) for every scalp of a man killed or prisoner taken of the Chetimachas and Alibamons (Alibamas). The American colonies offered bounties for scalps. In 1724 Massachusetts offered 100 pounds sterling (about \$500) for Indian scalps; 30 years later, during the so-called French and Indian war, the French offered a bounty for British scalps, and the colonists for Indian scalps. In 1755, 40 pounds sterling (about \$200) was offered by Massachusetts for the scalps of male Indians over 12 years of age, and 20 pounds sterling (about \$100) for the scalps of women and children.

This official encouragement to scalping led to the extension of the practice to tribes that had never before indulged in it. Naturally among these latter tribes the scalp had little or no ceremonial significance as it seems to have had among eastern tribes. Scalping appears to have probably arisen out of head-hunting which seems to have been common in parts of America at an early date. Among the tribes originally addicted to scalp-taking, a scalp dance formed a part of the ceremonies held on the return of a war party. In this dance the women, not the men, carried the scalps. The scalp was not, as popularly supposed, a standard by which to judge the powers of the warrior.

Consult Braunschweig, 'Scalping' (Smithsonian Reports 1906-07); Friederici, 'Skalpieren und ähnliche Krugsgebräuche in Amerika' (1906); Handbook of American Indians, 'Scalping' (Washington 1910).

SCALY ANT-EATER. See MANTIS.

SCAMANDER, *ská-măn'dér* (ancient *XANTHUS*), Turkey in Asia, a small stream in the Troad, rising near the city of Ilion. It had two sources, one of which was hot, the other cold. Strabo asserts, however, that it had but one source, which was in Mount Ida. Its direction was west-northwest, and about two miles from its mouth it received the small river Simois; it emptied into the Hellespont. Since the beginning of the present era these rivers have had separate courses. The Scamander is sometimes identified with the Mendere or Meander (q.v.).

SCAMMONY, a gum-resin obtained from the *Convolvulus scammonia*, native to the bushy wastes of western Asia. This is a climbing plant with irregularly arrow-shaped leaves, white or purplish flowers like morning-glories, and a fleshy tapering perennial root. When in flower, incisions are made obliquely in the upper part of this root, and shells fastened below the gashes, in which the sap is caught as it exudes. They

are then emptied, the juice added to scrapings from the root, thoroughly mixed, dried, and kneaded into cakes. Scammony is much adulterated, but when pure or "virgin" is greenish-gray or blackish in color, internally porous and of a resinous lustre, breaking with an angular fracture and translucent in thin pieces. It has a peculiar somewhat cheeselike odor and an acrid taste. Different kinds of the drug are named after the districts in which it is collected and the place of export. Scammony is a strong purgative usually used in combination with other medicines, and supposed to have been known to the Greeks as early as the 3d century B.C., also to have been one of the medicines recommended by Helias to King Alfred the Great.

SCAMOZZI, Vincenzo, vën-chënd'zō skāmōt'sē, Italian architect: b. Vicenza, 1552; d. Venice, 7 Aug. 1616. He was taught by his father, also an architect, and by Palladio and Sansovino, at Venice; and at Rome he studied ancient monuments. Returning in 1583 he was commissioned to erect a monument to the family of Marc Antonio Barbari, in the church of the Carita, and so much was this work approved that he was appointed to finish the grand library at Saint Mark's, to build the Trissino Palace at Vicenza and the Cornaro Palace on the Grand Canal, Venice. By this time Scamozzi's fame had spread over Europe and he was in great demand. He built the Ravaschieri Palace at Genoa, and added the second story to the Palazzo Strozzi at Florence (1594). About 1604 he designed the cathedral of Salzburg, Austria, and a part of the Schloss at Prague, Bohemia. His writings include 'Discourses on the Architecture of Rome' (1582); and 'Ideas of Universal Architecture,' two volumes of which were completed before his death.

SCANDERBEG, skän'dër-bëg, Albanian prince: b. 1404; d. Lissa, Albania, 17 Jan. 1468. His real name was George Castriotes, and he was the fourth son of John Castriotes, an Albanian prince. The sons being given to Sultan Murad II in 1423 as hostages of peace, the sultan named the youngest Iskender Bey (whence Scanderbeg) and made him a janissary after having poisoned his three brothers. When Scanderbeg's father died in 1432 and the sultan annexed Albania as a province, Scanderbeg determined to revolt. He had gained distinction in the Ottoman campaigns, and his opportunity came when, in 1443, he was sent to Hungary against the Christian Huniadi. He entered into agreement with the latter, gave him the victory, and fled to the sultan's powerful fortress of Croia, of which he gained command as the sultan's representative. Abjuring Mohammedanism, he now organized the Albanian forces and successfully repelled the armies of the entire Ottoman empire for 17 years, when the sultan's successor, Mohammed II, made a treaty with him acknowledging the independence of Albania and Epirus. A few years later he was persuaded by the Pope to join the Venetians against the Mussulmans and with an inferior force won eight great victories over Mohammed II.

SCANDINAVIA, skän-dī-nā'vī-ä, a general designation for the three north-European kingdoms, Denmark, Norway and Sweden (qq.v.),

sometimes applied in a more restricted sense to the two latter only. In the Middle Ages the name of Northmen was bestowed indiscriminately on the inhabitants of the three countries, whose closely related languages and common mode of life and political fortunes afforded sufficient basis for considering them one people. As a geographical term Scandinavia is rapidly passing out of use, but the appellation is still employed in an ethnographic, and especially in a literary sense.

SCANDINAVIAN LANGUAGE AND LITERATURE. See DANISH LANGUAGE, DANISH LITERATURE; NORWEGIAN LANGUAGE, NORWEGIAN LITERATURE; SWEDISH LANGUAGE, SWEDISH LITERATURE.

SCANDINAVIAN MUSIC. From the earliest known records it is evident that the music of the Scandinavian peoples was an accompaniment of songs and ballads based on the sagas, or prose epics embodying the myths and heroic tales current among their remote ancestors. The Danish 'Kalenpeviser,' the richest poetical remains of the folk-lore of the Middle Ages in Europe, consists of songs and ballads concerning giants, demigods and other supernatural creatures in Scandinavian mythology, the composition of which in the old Northern or Icelandic tongue has been referred to the 14th century. It is evident that throughout the Middle Ages the literature of Iceland was enriched with numerous national and other sagas whose subjects were drawn largely from scaldic songs. The 'Kalevala' or 'Kalewala,' meaning "the land of heroes," is the national epic of Finland. To Elias Lönnrot, of Hälsingfors, belongs the distinction of having rescued from oblivion many of the numerous sagas and songs which had for ages been recited by the Finnish *runolaineu*, or singers, to the sound of the *Kaultela*, or harp and thus transmitted from one generation to another. Lönnrot published the results of his researches under the title of 'Kalewada' (1835), the central hero of which is Wainamaineu, the god of poetry and music. The date of the action of 'Kalewala' is referred to a period anterior to the introduction of Christianity among the Finns in the 14th century. There is strong internal evidence, from the identity of the names and traditions of the 'Kalewala' with many still current in Esthonia, that its action very probably belongs to an epoch anterior to the immigrations of the Karelians into the districts which they now occupy. Thus, in Scandinavia, the song, with known and presumed instrumental accompaniment, is traceable back for more than four centuries.

In the development of modern musical composition, Denmark, Finland, Norway and Sweden present a strong array of masters, among whom are the following, with representative works:

Denmark.—JOHAN P. E. HARTMANN (1805-90), credited with being the first Danish composer to impart a distinctively Scandinavian flavor to his music; works: overtures, symphonies, cantatas, operas; 'Ib and Little Christina,' 'The Golden Hours,' 'The Corsairs,' 'Liden Keristen.' NIELS W. GADE (1817-90), pronounced a master of instrumentation; works: chamber, symphonic and choral music; cantatas 'Zion,' 'The Crusaders,' prize over-

ture 'Nachklänge von Ossian.' EDWARD LASSEN (1830-1904), composer of popular drawing-room songs; operas 'Fanenlob' and 'Le captif'; ballet 'Diana'; music to 'Œdipus in Kolonus,' 'Faust,' 'Pandora' and 'Nibelungen' (Hebbels). AUGUST ENNA (1860-), specialist in fairy opera based on Andersen's tales; works: 'Ib and the Little Christian,' 'The Match-girl,' 'The Witch,' 'Cleopatra,' 'Aucassin and Nicolette,' 'Gloria Arsena.'

Finland.—JEAN SIBELIUS (1865-), to whom Finland owes much of its recent musical fame; works: symphonies, symphonic poems, 'Tornissa olija impi' ('The Maid in the Tower'), the first Finnish opera; 'Korelia,' 'Finlandia,' 'Kanteleter' (collection of short lyrics), 'The Swan of Tuonela.'

Norway.—In the noted LINDEMANN family of composers, father and four sons, LUDWIG M. (1812-87) was conspicuous because of his great collection of Norse folk-songs, the treasure house of music. HALFDAN KJERULF (1818-68); works: forty 'Norske Folkeviser' ('Norse Folk-song'), 'Spring Song,' 'Shepherd's Song,' 'Cradle Song.' JOHAN S. SVENDSEN (1840-1911), violinist, court conductor at Copenhagen; works: symphonies, Norwegian Rhapsodies, 'Zorahayde' (legend), 'Carnival at Paris,' 'Coronation March' (for Oscar II), 'Carnaval des artistes norwegiens.' RIKARD NORDRAAK (1842-66), composer of many songs that became widely popular. EDWARD H. GRIEG (1843-1907), composer and pianist, in all his work preserved his Scandinavian individuality, especially in 'Norwegische Volkslieder und Tänze' (op. 17), 'Peer Gynt' (op. 23, 46, 55), 'Elegische Melodien' (op. 34), 'Norwegische Tänze' (op. 35) and 'Popular Norwegian Melodies' (op. 66). AGATHA BACKER-GROHDAHL (1847-1907), dean of Norwegian women composers; works: studies, sketches, songs. OLE OLESEN (1851-), works: operas, oratorios, cantatas, symphonic poems, choral songs, orchestral music, 'Asgaardsreien.' CHRISTIAN SINDING (1856-), works: 'Violin Concertos' and 'Sonatas,' opera 'Der heilige Berg,' symphonies, chamber music, piano solos, songs 'Rondo Infinito,' 'Episodes Chevaleresques.'

Sweden.—The preservation of a great mass of early Swedish folk-songs is due in large measure to two enthusiasts: ERIK G. GEIJER (1783-1847), published a collection of modern Swedish songs, another of Swedish folk-songs and a third of original songs in the old Swedish vein; ARVID A. AFZELIUS (1785-1871), published two collections of Svenska Folksvisor ('Swedish Folk-songs') and 'Afsked of Svenska Folksharpen' ('Farewell of the Swedish Folks-harp'). Composers: FRANZ BERWALD (1796-1868), works: symphonies, chamber music, opera 'Estrella di Soria.' ADOLF F. LINDBLOD (1801-78), called "the Schubert of the North," noted for his songs made popular by Jenny Lind (1820-27), "the Swedish Nightingale"; opera 'Frondenrerna.' IVAR HALLSTRÖM (1826-), credited with the creation of the national opera; works: 'Mountain King,' 'Bride of the Gnome,' 'Vikings' Voyage,' 'Granada's Daughter.' AUGUST J. SODERMANN (1832-76), works: operettas, 'The Wedding at Ulfasa'; music to Schiller's 'Jungfrau von Orleans'; a mass pronounced his best

work; concert overture, choral ballads. ANDERS HALLEN (1846-), dramatic composer; works: 'Harold der Viking,' 'Swedish Rhapsodies' (op. 17, 23), 'Vineta' (Choral rhapsody), 'Vom Pagen und der Königstochter.' EMIL SJÖGREN (1853-), organist Johankirke, Stockholm; works: 'Novelletten' (op. 15), 'Steimninger' ("mood pictures," op. 20), sonatas (op. 19, 24), 'Fantasiestücke' (op. 27). WILLIAM STENHAMMER (1871-), works: operas 'Tirfing,' 'Das Test auf Solhang'; choral 'Prinsessan och Soennen,' 'Snofried'; overture 'Excelsior.' HUGO ALFVEN (1872-), works: principally symphonies and chamber music. Consult Closson, 'Edv. Gr. et la musique Scandinave' (1892); Baker, 'A Biographical Dictionary of Musicians' (1900); Riemann, 'Geschichte der Musik seit Beethoven' (1901); Soubise, 'Histoire de la Musique: Etats Scandinaves' (1901); Baltzell, 'A Complete History of Music' (1905); Niemann, 'Die Musik Skandinaviens' (1906); Stanford-Forsyth, 'A History of Music' (1916).

SCANDINAVIAN MYTHOLOGY. The mythology of Scandinavia was distinct from that of ancient Greece and Rome, although both systems resemble each other in certain essential features, and they may possibly have had a common origin in the far-off prehistoric period. The differences were such as might be expected to exist between a nation cradled in the frozen North and nations living in the genial South. In the Scandinavian, as in Greek mythology, there are two periods, the prior one apparently reflecting misty traditions of the earth's development from chaos and darkness into order and light, perhaps stories which the cave-man had handed down to his children and they to their children, until they became crystallized into an ideal system of supernatural beings by the Vikings, who afterward invaded and conquered the Scandinavian countries. Geology has strangely verified the facts which were dimly shadowed forth in the early Northern mythology. The terrible ice age which converted Europe into an arctic waste, and pushed its awful precipices into the Atlantic beyond the Hebrides and the western coast of Ireland, evidently made an indelible impression on the mind of prehistoric man, who learned to regard ice as the deadly enemy of human existence, and the sun, with its vivifying heat, as the source of happiness and joy. This thought, almost a second nature, is reflected in the earlier mythology of the Scandinavian race, in its shadowy and crude mind-picture of something that had really happened, and that, it was feared and believed, might and would happen again.

The second and younger period of Scandinavian mythology reflects a new era. Men have conquered their old dread of an ever imminent catastrophe. They had battled with nature and found themselves often victorious. They have had heroes of their own, sharing their loves and revenges, triumphing in war and enjoying the rewards of valor and virtue. Nor were their women unwarlike, as became the daughters of heroes. The Amazons, real or imaginary, of Grecian story had their counterparts in the lore of the North. A new mythology grew out of new conditions, different from, yet linked with, the old, from which it was a natural evolution, and it is with this younger mythology,

its gods and goddesses, that Christianity was brought into contact, ultimately crushing it out after a struggle which proved the deep attachment of the Northmen to their ancient faith.

It is to be said for Scandinavian mythology that it never descended to the sensuousness of Greece and Rome, and was equally superior in breadth and imagery to the absurd polytheism of Egypt. It was terrible in some of its ideals, but never depraved. It imaged the spirit of the Viking race, and was well calculated to inspire them to the deeds of prowess which brought to their feet even the militant races that had founded kingdoms on the ruins of imperial Rome.

According to the earlier Scandinavian mythology there was originally no heaven and no earth, but a vast deep, a world of mist in the North called Niflheim, a fountain which was called Hvergelmer that flowed from the mist, and 12 rivers that issued from the fountain. These rivers froze into ice and filled the deep—a picture of the ice age. The world of fire and light was in a southerly direction, and was called "Muspelheim." The light and heat from the world of fire melted the ice from the world of mist, and from the melted drops sprang the ice-giant Ymer. A little man and woman proceeded from Ymer's left arm, and a son from one of his legs, and these were the ancestors of a race of ice-giants. A cow also came into being from the ice and heat, and gave milk to the giant Ymer, at the same time keeping itself fed by licking salt blocks of ice. One evening while the cow was licking the blocks, human hair grew out of them; on the following day a head, and on the third an entire man, who was called Bure. Bor, the son of Bure, married Bestla, the daughter of the giant Bolthorn, and they had three sons, Odin, Vile and Ve. The sons of Bor slew the ice-giant Ymer. From his body they created the heaven and the earth. His flesh became earth; his bones rocks; his teeth and pieces of his jaws became stones; his hair, grass and trees, and his blood the sea and rivers. His skull was used to make the sky, which was extended over the earth, with four dwarfs, Austre, Vestre, Sudre and Nordre, representing the East and West, South and North, at the four ends. Out of the heat and light from Muspelheim they made stars, which they fixed in the heavens to give light to the earth. Ymer's brain became clouds. From two ash-trees were created a man, Ask, and a woman, Embla, who were endowed with reason, language, hearing and sight. The tree of the world called Ygdrasil, stood over the well of time, with its top above the heavens, and three great roots, one among the gods, another among the giants and the third in the lower regions. The fountain of wisdom and the sacred fountain flowed forth near the roots. By the sacred fountain the gods held their councils, and from this and the fountain of wisdom sprang three beautiful maidens, the Norns, similar to the Fates of Greece and Rome. The Norns were Urd (the Past), Verdande (the Present) and Skuld (the Future). The Norns decreed the fate of men and gave them aid or punishment as they deserved. The gods dwelt in Asgard, in which was Gladsheim, the hall of gladness. The giants dwelt in Jotunheim and men in Manheim.

Nature-worship came in more distinctly with

the latter Scandinavian mythology. Odin, ruler of the universe, the Jupiter of the North, and his wife, Frigg, have for sons Thor, the god of thunder, and Balder, the god of justice and of eloquence; and Balder is father of Forsete, god of harmony. Njord, god of winds and of commerce, is father of Frey, who gives rain or sunshine, abundance or famine, to mankind, and of Freyja, who is goddess of love, but also, far different from the Grecian Venus, a model of womanly goodness and wifely devotion. Other gods and goddesses there are, most of them beneficent, and representing the better qualities of heart and conscience; all of them superior to the generally dissolute throng of immortals who sat in the court of Olympus when they were not engaged in some intrigue on earth.

The system was not without its terrors, however, its monsters who personified evil and presided over the doom of those debarred from happiness above. The malignant Loke was father of Hel, goddess of the infernal regions, and from whom is derived the name by which they are designated in the English tongue. She dwelt in Helheim, the hall of grief, with hunger for her table and disease for her bed. There the prisoners of fate led a dark and cheerless existence, in marked contrast to the delights of Asgard.

Scandinavian mythology dealt also with the future of the world and of humanity, and here again it is remarkably in accord, in some of its features, with the teachings of science, and it may be added also of religion. Heaven and earth are to pass away. The end will be preceded by great wars, severe winters, destructive storms and a covering of the face of the sun. The wolf Fenrer will devour the earth and giants will make an attack on heaven. The gods will perish. Then there will be a new sun; the earth, rescued from the jaws of Fenrer, will exist again, and a human pair, saved from the general destruction, will renew the human race.

Such was the faith of the fathers of that race which settled Normandy and conquered England, which gave rulers to Muscovy and Sicily, and guardians to the degenerate heirs of the Constantines—the race from which the English-speaking peoples of to-day are largely descended, and from which some of their most valuable qualities are derived.

SCANDIUM, in chemistry a rare metallic element discovered by Nilson (1879) in the mineral euxenite; symbol Sc; atomic weight 44.956. It is of special interest because its existence and properties were deduced theoretically by Mendeleef from his periodic system of elements. He called the to-be-discovered element ekaboron. As Nilson's scandium exactly the same atomic weight and physical properties foretold by Mendeleef it was a further proof of the value of the Mendeleef hypothesis. Scandium occurs in very small amounts in the minerals euxenite, gadolinite and yttrite. It forms a white oxide and a number of salts related to the same. Its compounds are colorless and have a rather acid taste.

SCALLAN, Lawrence, American Roman Catholic bishop; b. Tipperary, Ireland, 28 Sept. 1845; d. 10 May 1915. He was educated at All Hallows College, Dublin, where he was ordained in 1868. Coming to America, he was assistant at Saint Patrick's, San Francisco, Cal., from 1870 and at Saint Mary's Cathedral in San Francisco for the two years following. In 1871 he was sent to Pioche, Nev., where he was the first church in the section; in 1872 to Luma, Cal.; in 1873 to Salt Lake City, where he was first pastor for Utah Territory and then vicar forane. He was so successful in his management of church finances in Utah that he cleared the church of debt and secured a sum sufficient to purchase a large tract of land, on which he built an academy. After the end of work he followed until 1887, building churches and schools, and in 1886 founding the diocese of All Hallows in Utah. On 25 June 1887 he was appointed bishop of Lavenham, England, and apostolic vicar of Utah. In June 1887 he was consecrated at Saint Mary's Cathedral, San Francisco, by Archbishop Alejo, assisted by Bishops O'Connell and Connelley. He became the first bishop of the diocese of Salt Lake, Utah, 30 Jan. 1891.

SCANNELL, Richard, American Roman Catholic bishop; b. Cloyne, County Cork, Ireland, 1 May 1845; d. 8 Jan. 1916. He was educated at the College of Middleton, Cork, and at All Hallows College, Dublin, at which latter he was ordained priest, 26 Feb. 1871. He came to the United States the same year and was appointed assistant in Saint Mary's Cathedral, Nashville, Tenn. He served successively as pastor of Columba's Church and as pastor of Saint Mary's Cathedral, 1871-85, being administrator of the diocese of Nashville, 1880-83; and pastor of Saint Joseph's Church, West Nashville, which he organized, 1885-87. On 9 June 1887 he was appointed bishop of the diocese of Kansas, Kan., and was consecrated in Saint Mary's Cathedral, Nashville, 30 Nov. 1887, by Archbishop Alejo, assisted by Bishops McCloskey and Connelley. Upon the death of the Rt. Rev. Connelley he was transferred 30 Jan. 1891 to the diocese of Omaha.

SCANSORES, skān-sō'rēz, an obsolete name for birds represented by cuckoos, woodpeckers, parrots, toucans and trogons, and the

like, popularly known as that of the "climbing" birds, and distinguished primarily by the fact that the toes are directed two forward and two backward. It was an artificial group, whose members have been scientifically re-classified in the *Coraciiformes* and other groups, and are also known as *Zygodactylæ*, from the arrangement of their toes. Compare NATATORES.

SCAPA, an abbreviated designation for the London organization known as the Society for Checking the Abuses of Public Advertising, the purpose of which is the elimination of advertising displayed on boardings and other prominent places to the disfigurement of both towns and rural scenery. The society endeavors to reach its ends through both legislation and awakening public interest in its crusade.

SCAPE-GOAT, a goat which according to the Mosaic law was sent into the wilderness, on the Day of Atonement, bearing the sins of the people (see Lev. xvi, 1-6; Matt. xii, 43; Luke xi, 24). Under later Jewish practice the goat was thrown over a precipice about 12 miles from Jerusalem. Hence the term "scape-goat" is applied to any person who is made to suffer for the wrongdoing of others.

SCAPHOPODA, a class of *Mollusca* of a low type, known as fossils from the Devonian to the present, and surviving in only a small number of forms, typified by the tusk-shells (*Dentalium*). The head is rudimentary, the mantle-edges ventrally concrescent, forming a tube opening before and behind, and covered with a slight-curved shell shaped like an elephant's tusk. The body has its dorsal side toward the concave side of the shell, and is attached to the shell by muscles near the posterior or pointed end. The foot, which can be protruded from the anterior or wider aperture, is rather long, pointed and has sometimes two lateral lobes. All are marine, and some species live in very deep water. Consult Cooke, 'Mollusca' (London and New York 1895).

SCAPOLITE, the name of an important group of rock-forming minerals, including the species meionite, wernerite, mizzonite, marialite. Of these minerals wernerite (q.v.) is by far the commonest. All the species of the group crystallize in the tetragonal system and are hemihedral. Their color is generally white, gray or flesh-red; hardness, 5 to 6.5; specific gravity, 2.57 to 2.74. They are all silicates of aluminum, calcium and sodium; chlorine is also often present. Their composition has been explained by Tschermak by placing meionite at one end of the series with a typical formula of $\text{Ca}_2\text{Al}_2\text{Si}_2\text{O}_{10}$ and marialite at the other end with a typical formula of $\text{Na}_2\text{Al}_2\text{Si}_2\text{O}_{10}\text{Cl}_2$, and assuming that wernerite and mizzonite are isomorphous combinations of these two compounds in varying proportions. The scapolites are thus an interesting group of minerals similar to the feldspars in their formation of a series of compounds gradually varying in composition, the silica, soda and chlorine increasing as the alumina and lime decrease. Scapolites occur abundantly as primary minerals in Archean rocks in limestone and gneiss; meionite occurs in the volcanic rocks of Vesuvius, but with this exception, the scapolites occur in eruptive rocks only as secondary minerals, being products of the alteration of feldspars,

SCAPULA. See ANATOMY; OSTEOLOGY; SHOULDER-JOINT.

SCAPULAR, or SCAPULARY, an article of attire worn over the shoulders (*scapulæ*) by the inmates of monastic houses. Originally, in the Benedictine Order, it was worn over the regular monastic dress by the brethren when engaged in manual labor, but it is now part of the ordinary habit of the older religious orders, whether of monks or of friars. The word, however, is now commonly used to signify a sort of emblematic scapulary, consisting of two small squares of cloth held together by strings, from which the pieces of cloth are suspended so that one square reaches to the breast and the other to the back at the shoulder blades of the devotee who wears the scapular. There are several different kinds of these scapulars, to the wearing of which are attached sundry obligations and sundry spiritual privileges, such as indulgences, participation in the merits and the prayers of their fellow-members of a scapulary confraternity, etc. These miniature scapulars were brought into use in the 13th century by Saint Simon Stock, an Englishman and general of the Carmelite Order.

SCAR-TATTOOING. See TATTOOING.

SCARABÆIDÆ, skär-ī-bē-ī-dē, an exceedingly large family of beetles, including the most gigantic forms, although some of the species, as the chafers, dung-beetles, etc., familiar in the United States and Europe, are of moderate or small size. The terminal segments of the antennæ are composed of flattened plates, producing comb-like clubs. Unlike those of their relatives, the *Lucanidæ*, these plates can be brought closely together so the club appears compact. These plates are relatively larger in the males than in the females. The pronotum, especially in the males, is often ornamented with conspicuous and curiously shaped horns whose purpose is unknown as in the rhinoceros beetle. In structural detail and habits the members of this family differ widely among themselves. Some feed on manure. Certain American species roll together balls of dung wherein they lay their eggs, thus providing food for their grubs. Very many feed on plants, the beetles eating leaves; the larvæ the roots. The grubs are white and fleshy, usually bent into a semi-circle; the large head has powerful mandibles and no ocelli; the body-segments are often transversely wrinkled, and the hindmost segment is often greatly swollen. Some of the adult *Scarabæidæ* are dull black—the dung-beetles for example; while others are of bright metallic hues. The family ranges all over the world, but is most abundant in tropical countries. Several species are serious pests; for instance, May beetles or June bugs the larvæ of which feed on grass roots and when numerous destroy pastures and lawns and rose beetles, the adults of which destroy roses, grapes, etc. Rotation of crops eliminates the pests, and spraying with extra strength, sweetened arsenate of lead as an insecticide is one of the best preventives to control the scourge. A typical example of the group in the sacred beetle of Egypt (see SCARABS), whose carved images are called scarabeids.

SCARABS, representations of the sacred beetle found on Egyptian gems, coins, mummies, obelisks, and works of art. The appear-

ance and rapid multiplication of beetles in the mud on the subsidence of the Nile gave rise to the belief in their spontaneous generation, and they became the symbol of creation and creative power. Their circular shape and the bright, golden tints of their wing-cases suggested the shape and lustre of the sun. Thus they were taken to be one of the forms under which the sun-god appeared. Accordingly, scarabs were cut in stones and employed as seals and amulets, and after being bored through lengthwise were strung like beads, and easily worn on the person. After the commingling of the Egyptian with other races, Gnostics and Christians interpreted the meaning of these gems in accordance with their own religious systems. Those of the most ancient period, such as are found on mummies, are inscribed with the names of the kings held in highest veneration, Thutmosis III, Rameses II, and Amenophis III, and frequently with some hieroglyphic symbol. The larger of them have some short religious or historic inscription on their under side.

SCARAMOUCH, skär'ā-mowch, term derived from Scaramuccia, a famous Italian buffoon, who acted in England in 1673, and died in Paris in 1694; applied to one of the grotesque characters of the Italian stage, who was dressed entirely in black, wore a mask, and represented the swaggerer and poltroon. In France the scaramouch was used for a greater variety of parts.

SCARBOROUGH, skär'bū-rō, John, American Protestant Episcopal bishop: b. Castletwelan, Ireland, 25 April 1831; d. Trenton, N. J., 14 March 1914. He came to the United States when very young, was graduated from Trinity College, Hartford, in 1854, from the General Theological Seminary in 1857, and was ordained to the priesthood in 1858. He was assistant rector of Saint Paul's, Troy, in 1857-60, rector of the Church of the Holy Comforter, Poughkeepsie, N. Y., in 1860-67, of Trinity Church, Pittsburgh, Pa., in 1867-75, and in the last-named year was consecrated bishop of New Jersey, where he remained until his death.

SCARBOROUGH, William Saunders, American educator: b. Macon, Ga., 16 Feb. 1852. He was graduated from Oberlin in 1875, studied at the Theological Seminary there, and later occupied various chairs at Wilberforce University, of which he was vice-president 1895-1908, and then became president. He is of African descent and is actively interested in the education and uplifting of his race. His publications include 'First Lessons in Greek' (1881); 'Our Political Status' (1884); 'Birds of Aristophanes' (1886), etc. He was an authority on Hellenistic and Classical Greek, negro folklore, and philological and archæological subjects.

SCARBOROUGH, England, in the county of York (North Riding), popularly known as "The Queen of English Watering Places," is on the North Sea, 39 miles northeast of York. The main part of the town is on the south bay, and rises in successive terraces; the new quarters are divided from the older by a deep ravine crossed by two bridges. The modern period of the town dates from the discovery of mineral springs in 1620. The Grand Hotel, on Saint Nicholas Cliff, is one of the largest in England. There is a fine aquarium, a museum

— a Roman Doric rotunda — a mechanics' institute, and the Spa and its grounds are attractive features of the place. There are fine promenades. The People's Park occupies both sides of the valley. Fishing and the manufacture of jet ornaments are the chief occupations. The castle erected about 1136 was held against the Barons by Piers Galveston, and it was twice besieged by the Parliamentary forces. Later it became a fortified barrack. In 1914 it was bombarded with a loss of civilian life by a German squadron. Pop. 37,000.

SCARBRO, W. Va., town situated on the Chesapeake and Ohio and Virginian railroads. The chief industry is coal mining, the famed New River smokeless coal being produced here. The value of the town's taxable property is \$400,000. It contains a 10-room graded school. The annual receipts and expenditures average about \$2,000. The town is situated at an altitude of 1,800 feet and was named for the English town of Scarborough. Pop. 5,000.

SCARECROW, The. The prolific pen of Percy Mackaye has never turned out a more satisfactory drama than this, called by him "a tragedy of the ludicrous." It is clearer in its philosophical purpose, more skilful in its dramatic treatment, more direct in its human application than anything he has yet done. When it was given in New York, at the Garrick Theatre, on 17 Jan. 1911, with the excellent support of Frank Reicher, as Ravensbane, and Edmund Breese, as Dickon, a Yankee improvisation of the Prince of Darkness, it met with the cordial recognition it deserved. Were repertory the fashion at the present day (1919) in the American theatre, it would occupy a worthy place among the plays for constant revival.

The inspirational source for 'The Scarecrow' is Nathaniel Hawthorne's 'Feathertop,' a tale included in his 'Mosses from an Old Manse'; Mr. Mackaye acknowledges his dependence on the story for the main ideas of his plot. But he writes an introduction to the printed play, showing the main details in which he and Hawthorne differ. These may be summed up briefly: Hawthorne's Scarecrow "is the imaginative epitome or symbol of human charlatanism," the satire being aimed against fashionable society. Mr. Mackaye stretches his philosophy to wider application. His Scarecrow, Ravensbane, is the "emblem of human bathos." Are we not all more or less human scarecrows, composed of rubbish, out of which we have to hew our own salvation? When Dickon and Goody Rickby construct a scarecrow, and breathe into him, by their devilish magic, the breath of life, symbolized by the glow of a pipe, which keeps Ravensbane alive, they do so in order to wreak vengeance on the old justice, Gilead Morton. But they give no thought to the tragedy which might befall a scarecrow thus thrust upon the world and subject to human experience. They do not realize that when, at the end, in love with the justice's niece, Ravensbane looks into the magic mirror, which reveals people as they really are, he will see himself as a scarecrow, and the tragedy of the ludicrous, so entertaining to the onlooker, will fall heavily on his own poor pumpkin head.

"What absurdity is our highest consumma-

tion!" writes Mr. Mackaye; "Yet the sense of our highest deficiency is, after all, our salvation. There is one reality which is a basic hope for the realization of those dreams. This sense is human sympathy, which is, it would seem, a more searching critic of human frailty than satire. It is the growth of this sense which dowers with dignity and reality the hol-lowest and most ludicrous of mankind, and becomes in such a fundamental grace of character."

Where Hawthorne ends, therefore, so Mackaye claims, his play begins; where Hawthorne's shafts hit charlatanism, he mingles human sympathy with irony, and there is for Ravensbane, the scarecrow, the same feeling of pity that one feels, now and again, for Don Quixote. In his object the dramatist succeeds well. With the result that 'The Scarecrow' may be accounted a good drama, admirably fulfilling its purpose, and admirably reflecting New England temperament of the early witchcraft days.

MONTROSE J. MOSES.

SCAREY CREEK, Engagement at. On 2 July 1861 General McClellan, then preparing to advance from Buckhannon against the Confederate forces under General Garnett at Rich Mountain, ordered General Cox to move with one brigade from Camp Dennison, Ohio, cross the Ohio River at Gallipolis, and operate in the Kanawha Valley, the object of the movement being to secure McClellan's right flank and to prevent General Wise from reinforcing Garnett at Rich Mountain. With three regiments Cox arrived at Gallipolis, where he was joined by another regiment, and on the 10th crossed the river to Point Pleasant, where he received orders from McClellan to drive Wise from the Kanawha Valley. Cox went up the Great Kanawha on steamboats, and at the mouth of Scarey Creek, on the south side of the river, found his passage disputed by a force of 200 men, with two guns, under command of Colonel Patton. It was necessary to dislodge Patton, whose two guns commanded the river. A small body of Cox's command had reconnoitered the position, and awaited the arrival of Cox's main body, which came up on the 16th. Cox landed on the north side of the river, and on the 17th Colonel Lowe, with the 12th Ohio, two companies of the 21st, and some cavalry, in all 1,020 men and two guns, was landed on the south side of the river and advanced upon Patton, reaching the bank of the creek about 3 p.m. The two guns were put in position and the cavalry advanced, but were speedily driven back by the Confederate guns. The artillery now opened on both sides and, after some sharp firing, Patton's men were seized with a panic; but reinforcements coming up, they were rallied, and the Confederates advanced and took position along the bank of the creek, across which there was quite a severe contest. A small Union force was sent across the creek to turn the Confederate left and seize their guns; but, not waiting for this movement to develop, the main body charged across the creek and drove the Confederates up the hillside, back upon their guns, and another panic ensued. But more reinforcements coming up, the Confederates rallied and poured such a telling fire into the advancing Union line that it fell back in

disorder, leaving dead and wounded on the field, recrossed the creek, and continued the retreat. The Union loss was two officers and 12 men killed and 47 men wounded; the Confederate loss one officer and four men killed and nine wounded. Two colonels, a lieutenant-colonel, and two captains of Cox's command, whose regiments were not engaged, but who were led by curiosity to see a fight, left camp on the north side of the river and were taken prisoners. This check delayed Cox's advance up the river several days, until he could get land transportation. Consult 'Official Record' (Vol. II).

SCARIDÆ, a large family of fishes, represented by the parrot-fishes, which occur in all warm seas, lingering about coral reefs and weedy rocks. Few species are of any value as game or for food, but some are utilized in the West Indies and Hawaii. See **ICHTHYOLOGY**.

SCARLATINA. See **SCARLET FEVER**.

SCARLATTI, skär-läa'tē, **Alessandro**, Italian composer; b. Trapani, Sicily, 1659; d. Naples, Italy, 24 Oct. 1725. Appointed maestro di capella by Queen Christina of Sweden, he wrote his first opera for performance in her palace. He produced his first oratorio 'I Dolori di Maria sempre Vergine,' in 1693, and was then appointed maestro di capella to the viceroy at Naples. He held the position of chapel-master at Santa Maria Maggiore, Rome, 1707-09, and then returned to Naples. Scarlatti was possessed of great fertility of imagination. In method he opposed the enemies of the counterpoint, being considered the greatest contrapuntist of his age, and the inventor of accompanied recitative. His compositions, few of which have been published, included 115 operas, 200 masses, 9 oratorios, 500 cantatas, and miscellaneous minor pieces. Three of his operas, 'Geroue'; 'Il Flavio Cuniberto'; and 'La Teodora Augusta,' preserved in the original manuscripts, are at Christ Church, Oxford, England, and another is in the British Museum.

SCARLET FEVER, or **SCARLATINA**, an acute infectious disease, the specific cause of which has not yet been discovered (1919). The disease is characterized by a rapid onset of fever, general symptoms of poisoning, and later by the appearance of a typical rash. The disease was not definitely described until the latter part of the 16th century, although an occasional case is suggested in literature before that time. Epidemics ravaged Europe for 150 years before the disease made its appearance in America; this was in Massachusetts in 1735; and the disease then spread all over New England and the rest of North America. Not until 1830 did it get a foothold in South America, but since that time epidemics have been widespread and frequently very malignant.

In spite of laborious researches, the causative agent has as yet eluded detection. The disease is transmitted directly from one individual to another, or through articles which have been in the sickroom, such as clothing, bedding, paper, pictures, and particularly those substances from which infectious material is not readily dislodged. The virus is not killed by cold, but dry heat, steam and gasses such as formaldehyde or chlorine are thought to destroy it after a comparatively short exposure to their action. It is doubtful if this is true. The con-

tagion is given off in the discharges of the nose and throat, in the vomit, in mother's milk and in the desquamated skin. It may also be carried in the milk-supply, as animals are liable to the disease. It occasionally happens that the disease is transmitted before the appearance of the rash, but the most contagious period is after the onset of desquamation. The young are particularly liable to the disease. One attack usually protects the individual for life.

The period of incubation lasts from two to seven days, and occasionally longer. The onset is usually sudden and active, the patient appearing very sick and dull, complaining of sore throat and general pains throughout the body. Severe and persistent vomiting ushers in the attack. The temperature rises rapidly, reaching 103° or 104° F. in the first 24 hours. These symptoms constitute the prodromata, lasting from 12 to 36 hours; at the end of which period the rash appears, first on the front of the neck and chest, and gradually spreads over the entire body in two or three days. This rash is a diffuse blush of brilliant scarlet hue, showing tiny elevations of a deeper color scattered through the general redness. The temperature and severity of the disease increase until the rash is all out, then gradually subsides, the temperature reaching normal about the 10th day. The tongue shows similar elevations to those described on the skin, and hence is described as "strawberry tongue." The throat presents a general intense redness of the pharynx, palate and tonsils, with sometimes small white spots, or considerable patches of false membrane of a pearly white appearance. Desquamation begins about seven days from the appearance of the rash, and the parts that are first affected are the first to desquamate. The process continues until the entire skin of the body is shed. At first the desquamation is in the form of tiny particles, but after it has continued for a few days the skin begins to peel off in large flakes, sometimes even the entire skin of the hand or foot being shed in one piece. This process is not completed in less than 10 days, and may take over six weeks, the skin between the toes and fingers being the last to peel. There may be an entire second desquamation, but it is doubtful if this ever carries contagion. The popular belief that the disease is more serious to adults than to children does not seem to be warranted by the observation of eminent authorities.

The complications of scarlet fever are common and frequently very serious. From the throat germs may pass through the Eustachian tubes to the ears, causing inflammation there. The lymphatic glands of the neck may be enlarged by the poison passing through them, and sometimes they suppurate. Inflammation of the joints having all the characteristics of rheumatism is very common; and affections of the heart may follow this rheumatic complication. There is probably more or less affection of the kidneys in all but the very mild cases, but in some the inflammation of the kidney structure is so severe that the picture of acute nephritis is paramount. (See **KIDNEYS**). From such inflammation the patient may entirely recover, being left with normal kidneys, or he may succumb because of their impairment; or, again, the kidneys may be left permanently changed; this last condition being particularly apt to

occur when the inflammation sets in late in the disease or during convalescence. Ordinary cases of scarlet fever are seldom fatal if the complications referred to are absent.

The diagnosis, before the appearance of the rash, is suggested by the rapid onset of the symptoms, the intensely red throat, and the persistent vomiting. The prolonged period of fretfulness, watery eyes and running nose of measles does not occur in scarlet fever; and, differing from that of scarlet fever, the desquamation of measles is bran-like. If a membrane is formed in the throat, it may be necessary to resort to bacteriological examination to distinguish between diphtheria and scarlet fever. There are many drugs which may cause a rash, closely resembling that of scarlet fever; among them, carbolic, benzoic, boracic and salicylic acids, salol, alcohol, antipyrin, phenacetin, arsenic, mercury, potassium chlorate, quinine, sulphonal, belladonna, hyoscyamus, copaiba, cubebs, rhubarb, strychnine and various ptomaine poisons. The rash caused by these substances comes out very quickly, and usually is of very short duration, while differentiation is also made by the absence of constitutional symptoms or the peculiar symptoms of the drug.

The malignant types of scarlet fever have sometimes characterized entire epidemics, but they are now rarely seen. Such cases are seen from the start to be very serious, being attended with high fever, rapid and feeble pulse, intense and persistent vomiting, headache, delirium and coma, death ensuing in two or three days.

Treatment.—As scarlet fever is self-limiting and no specific remedy is known, that in any way reduces the virulence of the intoxication, reliance must be placed on careful nursing of the patient, constant watch to ward off complications, measures for the relief of such complicating inflammations as do develop and scrupulous efforts to prevent the spread of the disease. Since isolation must be continued for six weeks at least it is important to select a bright, sunny room, if possible, having an open fire. The patient is kept in bed for at least two weeks, commonly much longer. The vomiting is relieved by small pieces of cracked ice; the throat is sprayed twice daily with a mild antiseptic, such as boric acid; the patient is bathed with lukewarm water if the temperature is high, but antipyretic drugs are best avoided. After desquamation begins the entire body is covered daily with a simple ointment to favor it and to diminish the possibility of the contagion being carried. For the first four weeks of the disease the diet consists entirely of milk, but careful watch must be kept of the kidneys, as their impairment may demand a longer continuance of that diet. Not until the lapse of six weeks at least is the patient allowed to go out of doors, and not then if the weather be inclement. To prevent the spread of the disease, thorough disinfection of the sickroom and all of its contents is essential. The patient is thoroughly washed with a solution of corrosive sublimate, then removed to another room to be dried and dressed. The mattress is wrapped in wet cloths, removed from the house, and preferably destroyed. Everything that has been left in the sickroom should be disinfected with solutions of antiseptic property, or subjected to the action of steam in a closed chamber.

The wall paper should be scraped off, and the walls, ceiling and floor washed with a strong solution of corrosive sublimate, a mop or a loaf of bread being used. Formaldehyde gas is then to be generated in the room for 10 hours, after which the windows are left wide open for several days.

SCARLET GRAIN, a dye-stuff consisting of coecid insects allied to cochineal. See *Coccus*.

SCARLET IBIS. See *Ibis*.

SCARLET LETTER, the first and by general consent the greatest of Nathaniel Hawthorne's four chief romances, was originally planned as a short tale, and was expanded to its present proportions on the urgent advice of the author's friend and publisher, James T. Fields. When, with the change of administration in 1849, Hawthorne was removed from the surveyorship of customs at Salem, he undertook a collection of short pieces that might have borne to the custom-house, where he had worked, the same relation that his preceding collection had borne to the Old Manse, where he had lived. An introductory sketch, 'The Custom-House,' written for this collection, is always prefixed to 'The Scarlet Letter,' though it has no real connection with the romance, and though it contains some unfortunate personalities which show the writer's ill-temper over the loss of his position. The account in this sketch of the finding of a moth-eaten embroidered "A" and a manuscript in the upper rooms of the custom-house is of course fanciful. Years before, in the tale of 'Endicott and the Red Cross,' Hawthorne had made incidental mention of a woman who was forced to wear a scarlet "A" in token of her guilt, and the thought of this punishment, or rather of its effect on the wearer, seems to have remained with him until it resulted in the creation of Hester Prynne. 'The Scarlet Letter' was published in the spring of 1850, and instantly won for the author a recognition that had been denied to the delicate and finished shorter tales of his earlier collections. Its reputation in America has increased rather than diminished with time, and it has been warmly praised in England. In other countries it is less known, perhaps partly because many of its effects are too subtle for translation, partly because the peculiar New England quality is not readily appreciated by those of another race. 'The Scarlet Letter' is in every way typical of Hawthorne. The background is colonial New England, and the theme is the effect of a great sin on the four persons most concerned—Hester Prynne, who wears the scarlet letter, her paramour, the wronged husband, and the child who is the offspring of illicit love. When the tale opens, the sin is a thing of the past, and the judgment of the law has been imposed. The author passed by the story of love, temptation, yielding, and discovery, and beginning where another novelist might have ended he traced the moral and spiritual tragedy which followed. Even in the handling of this material he made no use of the ordinary devices of the story-teller. Thus, the identity of the guilty man, which might have been so treated as to arouse curiosity and then revealed with startling effect, is allowed to transpire quietly. The chief contrast is between Hester, who suffers

openly, and her partner in guilt, who maintains his honorable position in the community unsuspected; and the lesson which is most likely to be drawn is that of the virtue of open expiation, and the evil of concealment, even where there seem to exist the strongest arguments against confession. In the author's own words, "Be true! Be true! Be true! Show freely to the world, if not your worst, yet some trait whereby the worst may be inferred!" A secondary moral, the deadening effect of a secret and long-continued plotting for revenge, as seen in the husband, Chillingworth, is almost too obvious. Yet 'The Scarlet Letter,' while it is sure to stimulate thought, is not in any sense a preachy book. The reference in the conclusion to Hester's belief in "a new truth" which should "establish the whole relation between man and woman on a surer ground of mutual happiness," is somewhat perplexing, but has probably been taken by radical social reformers more seriously than the author intended. Throughout the book the thought of the scarlet letter, both as a material object and as a symbol, is everywhere present, and is woven into the tale with even too great ingenuity. It is personified in the child, Pearl; it seems to imaginative observers to be flashed in the heavens by the track of meteors; and as we are led to believe, it was burned in penance on the breast of the guilty man. The background, the characters, like the demented witch-sister of the governor, the incidents, and the motive unite to sustain throughout the romance a uniform tone—sombre, tragic, unbroken from first to last by a trace of humor, and still neither morbid nor repellant. It would have been a great achievement to tell such a story for the select few who are fond of subtle psychological analysis; it is marvelous that Hawthorne made a tale, in which nothing outward happens, appeal to the mass of readers who are accustomed to demand constant action.

WILLIAM B. CAIRNS.

SCARLET TANAGER. See **TANAGER**.

SCARLETT, Sir James Yorke, English soldier: b. 1799; d. December, 1871. He was educated at Eton and Cambridge, entered the army, and in 1854 was sent to the Crimea in command of the heavy brigade. On the 25th of October he led the brigade in its famous charge at Balaclava, and later in the day it brought out of action the remnants of the light brigade after its even more famous charge. In both of these actions Scarlett took a prominent part in the hand-to-hand conflict. For these services he was promoted to the rank of major-general, on 12 December following, and upon the retirement of Lord Lucan took command of the entire cavalry forces in Crimea. In July 1855 he was created a K.C.B. He commanded the camp at Aldershot 1865-70, and retired from active service in the last-named year.

SCARP. See **FAULT**; also **ESCARPMENT**.

SCARPA, skär'pā, Antonio, Italian anatomist: b. Friuli, Italy, 13 June 1747; d. Pavia, Italy, 31 Oct. 1832. He studied medicine at Padua, in 1772 was appointed professor of anatomy at Modena, and published in that year his first work on the anatomy of the ear, 'Anatomicæ Observationes de Structura Fenestræ rotundæ Auris.' In 1783 he resigned this chair to accept a similar one at Pavia, where he pub-

lished his great work, 'Anatomicæ Disquisitiones de Auditu, etc.' (1789). At the time of the revolution in Italy he was deprived of his professorship in the university on account of refusal to take the oath required by the Cisalpine republic. He now published his celebrated work on 'Aneurisms' (1804). When Napoleon, after his coronation as king of Italy, arrived at Pavia (1805), and received the officers of the university, he inquired after Scarpa. He was informed that he had long ceased to be a member of the university, and was told the reason. "What," said Napoleon, "have political opinions to do here? Scarpa is an honor to Pavia and to any dominions. Let him be honorably restored." Scarpa was the author of several other surgical works besides those already mentioned. Most of his works have been translated into English and French.

SCARPANTO, skär'pān-tō (ancient **CARPATOS**), a Turkish island of the Mediterranean, 28 miles southwest of Rhodes. It is 27 miles long by six miles wide, is rocky and mountainous, and has four harbors, two on the east, one on the north and one on the southwest side, known respectively as Port Pernesi and Port Avdemo, Port Skomaco and Port Grato. There are indications pointing to a former dense population, as judged from the numerous ruins of towns. Pop. 5,000.

SCARRON, skā-rōn, Paul, French author and playwright: b. Paris, France, 6 July 1610; d. there, 6 Oct. 1660. Refusing to take orders he led a wild life in Paris and in Rome, to which city he went in 1634. Shortly after his return to Paris in 1637 he was stricken with an illness which left him a paralytic for the rest of his life. His mind was not affected, however, and he made his livelihood by literature. At one time he was the pensioner of the queen, but losing his pension through the influence of Cardinal Mazarin, he then wrote in revenge his satirical 'Mazarinade' (1649), one of his best-known works. He married in 1652 the young and beautiful Francine d'Aubigne, afterward Mme. de Maintenon. Both before and after this event, which Scarron survived eight years, his house was the centre of a brilliant literary society. The most famous of Scarron's writings in his own time is said to have been his 'Virgile Travesti' (1648-53), but modern critics prefer his 'Roman Comique' (1651). There have been many editions of his works; the best are those published in Amsterdam (10 vols., 1737) and reprinted at Paris (7 vols., 1786).

SCARZONERA, a genus of composite plants with numerous species, chiefly indigenous to the Mediterranean regions. The flowers are yellow or rarely rose-colored, having many series of involucre bracts, plumose and unequal pappus, and achenes without a beak and generally wingless. *S. hispanica*, sometimes known as viper's grass, has long been cultivated for its tapering, fleshy, edible roots, the dark-brown skins of which have caused it to be called black salsify. The leaves are long and lanceolate with waving edges. Other species are also cultivated for their roots.

SCAUP, skāp, or **BLACKHEAD DUCK**, a duck (*Aythya marila*), of the same genus as the redhead (q.v.), which it closely resembles in form but from which the green-glossed black

head of the male and the white face of the female distinguish it. It is a very abundant duck about the shores of the North Atlantic, frequenting the sounds, bays and estuaries of the United States to Central America in winter and in the spring passing northward and inland to breed. On the coasts of the New England and Middle States the scaup is most abundant during the fall migration, occurring in flocks which feed chiefly upon small mussels and other marine animals, especially mollusks, secured by diving.

A closely related species is the lesser scaup duck (*A. affinis*), which is almost an exact smaller counterpart of the blackhead, except that the head of the male is glossed with purple instead of green and the length is about 16 instead of 18 inches. This species regularly consorts with the larger scaup and is altogether similar in distribution and habits. Both species are shot in large numbers by sportsmen and market gunners and regularly sold in the markets, but the flesh is rather coarse and strong-flavored.

SCOLIDOTHERIUM. See MEGATHERIUM.

SCELOPORUS, sē-lōp'ō-rūs, a genus of lizards of the family *Iguanidae*, to which the Florida chameleon (*Anolis*) and the horned toads (*Phrynosoma*) also belong. Among its kindred, this genus is distinguished by its imbricated keeled scales, the absence of a dorsal crest, of gular folds or a gular sac and of head-spines. The tympanum or ear-drum is exposed between the small scales of the side of the head; the tongue is fleshy and shaped somewhat like an arrowhead; teeth are confined to the jaws and have trilobate summits. Femoral pores, the secretion of which assists the sexes in mating, are well developed. Between 30 and 40 species of this genus are known, all of them American and most of them confined to Central America, Mexico and the southwestern United States. In this region these lizards are exceedingly abundant and are everywhere conspicuous objects. They are chiefly terrestrial, but many of the species also live upon stone walls or fences or run up tree trunks when alarmed. Their food consists of insects, which they seize with the greatest agility. In temperate regions they hibernate in cold weather. The males are generally ornamented with bright colors on the under parts which may be considered to be secondary sexual characters. The eggs, which have a parchment-like shell hardened with lime, are usually retained in the oviducts until the young are partly or wholly developed; when deposited, holes in the ground, decayed stumps, etc., are utilized for their concealment. As in many other lizards, the tail is easily broken along an unossified plate across the body of the vertebræ, after which it regenerates, but always imperfectly. The only eastern species is the common swift or fence-lizard (*S. undulatus*). Consult Cope, 'The Crocodilians, Lizards and Snakes of North America' (United States National Museum, Washington 1900).

SCENES OF BOHEMIAN LIFE, The, by Henri Murger (1822-61), though published at the beginning of his literary career (they began to appear in the periodical press in 1847) mark the highest point in his achievement. His poetry (he always believed himself a poet) has

not stood the test of time, and his later novels are outranked by their predecessor. This suffices, however, to give him his place which is larger in the affectionate remembrance of his compatriots than in French literary history, for his success was due to the peculiar optimism and buoyancy of his temperament rather than to any special artistic quality. This temperament allowed him to regard his own difficult and harassed life as a subject for comedy and high-spirited rejoicing. His famous work frequently reproduces scenes and incidents in his own experience. The son of a Paris janitor and tailor, he was driven from home as a lad and in his effort to win recognition as a poet was reduced to a condition of starvation which resulted in impairing his vitality and frequently brought him into the wards of Paris hospitals. To support himself he was at intervals, like his hero Rodolphe, reduced to uncongenial and often unpaid tasks on cheap ephemeral trade journals like the *Scarf of Iris* or *Beaver* (*Le Castor*) of the *Scenes*. On one ever memorable occasion he, however, received for past and future services 500 francs, which provides one of the well-known incidents of his story. The indulgent ever-smiling young *Bohémiennes*, like Mimi and Phemie and the rich young lady cousins, never if ever appeared in the doorway of his garret where he toiled unremittingly for success. It is for this reason that it is no true picture either of his own struggle or of the hard-working and serious life of the Latin Quarter of his time, which, though it had its rare gala days of festival and high spirits, had also its long months and years of unrequited toil that often ended in final poverty and failure. For this reason those who know "Bohemia" best refuse to recognize Murger as its portrayer. A truer picture is to be found in the biographies of Balzac or Zola or Daudet, who passed through its toil and trials before or after this time. It should also be remembered in this connection that of the hundreds of talented young men who struggled with them only a very small percentage won lasting recognition or any financial reward. Murger was, therefore, not in any sense a realist but a delightful humorist and idealist who created certain exaggerated but ever fresh and amusing types and who made a life of toil against heavy odds, relieved by the joys of youthful comradeship and kindred aims, appear as one long and uninterrupted holiday. This exaggeration of type is the reason why his heroes and heroines with but little change make the strikingly successful characters of the light opera by Puccini based upon his work. It was Bohemia as he would have wished it, but as it never was for him or his serious brothers in the fellowship of art. See BOHÉME, LA.

CHRISTIAN GAUSS.

SCEPTICISM, in its widest meaning, is a state of doubt or suspense of judgment. It is often used in connection with religious belief, and here indicates doubt or disbelief of authorized doctrines. The word scepticism has a specific meaning, however, which is implied in its more general uses, and in this meaning it has a philosophical reference and relates to the problem of knowledge. Thus used, scepticism signifies systematic doubt or entire disbelief in

the ability of the human mind to attain knowledge of positive or objective truth. Such scepticism has been of frequent occurrence in the history of thought from antiquity to the present time. It has received systematic expression from several noted thinkers who supported their conclusions by explicit arguments. The grounds of systematic scepticism are many and cannot be given in full detail. Its fundamental basis in theory is usually found in the assumption that knowledge arises from a succession of particular sensations which are (1) subjective modifications, and (2) detached and transitory mental states. As subjective modifications, these sensations are the product of the sense-organs of the individual. Their nature depends upon the structure of the particular sense-organ, which varies with each individual, and also upon the bodily condition of the individual which varies from moment to moment. Hence these sensations, being relative to individual structures and conditions, have only a subjective value, and can yield no truth that is objective and necessary for all. As detached and transitory mental states, these sensations can furnish no criterion of truth beyond the single sensation. Because detached and particular, such a single sensation can justify no conclusion of universal validity. Because itself transitory, such a single sensation can reveal nothing of a permanent and abiding reality. Beside these theoretical considerations, many practical reasons have been urged to support scepticism, such as the difference of opinion and belief among different peoples upon most vital matters of life and morals. In antiquity the first important exponents of scepticism were the Sophists of Greece. Of this school Protagoras held that all truth was relative, since all sensations were subjective. At a later period in Greek thought, a systematic scepticism was developed by Pyrrho of Elis and elaborated by his school. According to the Pyrrhonic scepticism, the real nature of things is entirely unknown to us because of the subjectivity of our impressions and opinions; and, consequently, our proper attitude is one of suspense in judgment and apathy in conduct. The foremost representative of scepticism in modern times is David Hume. He maintained that "all knowledge resolves itself into probability"; for, being based upon particular impressions, it can reveal nothing of permanent or objective reality beyond the succession of sensations. In estimating the importance of scepticism in the history of thought, one must distinguish between scepticism as (1) a provisional stage and (2) a final conclusion of thought. As a provisional stage, scepticism has discharge an important office in the development of thought. In the life of both individual and race, periods of scepticism are useful in disposing of traditional beliefs which lack adequate foundation, and so in preparing the way for better-established conclusions. Thus with Descartes a stage of doubt was preliminary to his positive thought, and likewise the scepticism of Hume was preliminary to the constructive philosophy of Kant and his successors. As a final conclusion scepticism has never been permanently satisfactory, because the inherent demand of the human mind is for positive truth.

Consult Plato, 'Protagoras'; Zeller 'Stoics,

Epicureans, and Sceptics' (tr. London 1892); Hume, 'Treatise of Human Nature'; Owen, 'Evenings with Sceptics.'

SCEPTRE, originally a staff, the emblem of sovereign power. The baton, or short sceptre, has always remained a sign of distinction. In the Greek assemblies a person who wished to speak received a sceptre from the herald; and the judges also bore it while in the exercise of their authority. Kings swore by the sceptre. By degrees it became the emblem of power alone. Through the Roman emperors it passed to the western monarchs.

SCHAAFFHAUSEN'SCHER, A., (sháf-hou'zën-shër bänk-fër-iné,) **BANKVEREIN**. The A. Schaaffhausen'scher Bankverein of Cologne was founded in 1848 as a reorganization of the firm of Abraham Schaaffhausen (seriously affected by the troubles of the same year), with a capital of 5,187,000 thalers (about 15,600,000 marks), of which the initial issue was 3,199,800 thalers. In 1914 it was absorbed by the Disconto-Gesellschaft (q.v.), retaining its name and clientele under the management of W. L. Deichmann, Gustav Mevissen and Victor Wendelstadt, men of caution and experience, the institution began its activities in the fostering of important industrial enterprises. Its purpose may be inferred from an excerpt from the annual report for 1852—"the function of a great banking institution is not so much to start new branches of industry through extensive participation, as to induce the capitalists of the country, by recommendations based on exhaustive investigations, to turn idle capital toward such enterprises, which, when properly launched, in response to existing requirements, and offering the guarantee of expert management, bid fair to yield reasonable profits." Industrial in purpose, current account business was secondary, and deposits were received only on condition of three, six and 12 months' notice being given for their withdrawal, and then only at a low rate of interest. The close identification from the first with the prosperous and flourishing Rhenish-Westphalian industry, and the strict adherence to its original purpose, lent strength to the Bankverein to weather the financial crisis of 1857 without the necessity of canceling any of its outstanding credits—a strong factor in extending its influence during succeeding years. One after another it nurtured industrial enterprises within its banking zone, each becoming an added source of strength for the Bankverein. In 1891 a branch was opened at Berlin—a branch in fact as well as name—the parent institution remaining the only one of the five German "great" banks having its headquarters outside of Berlin. In 1908 the number of branches was 10, with one silent partnership, or "Commandite" and 15 deposit offices. Six subsidiary banking companies have been founded wholly or in part by the Bankverein (largely in co-operation with the Dresdner bank), giving foreign banking and exchange facilities, a small incident in the general scheme of the Bankverein. Four German banks with 13 branches have been absorbed wholly and another jointly with the Dresdner bank. In addition, through ownership of shares, it maintains community of interest relations with three important banks, having 21

branches and numerous agencies, deposit offices and subsidiary connections. Most important, however, is the community of interest, mutual in terms, between the Dresdner Bank and the Bankverein, beginning 1 Jan. 1904. Representation is maintained on the boards (1908) of 94 other industrial and financial institutions. The capital of the Bankverein (1908) was 145,000,000 marks; and 34,157,125 marks surplus. The total capital power of the A. Schaaffhausen'scher Bankverein group was (1908) 278,538,001 marks, of which 231,000,000 marks constituted the capital, and 47,538,001 marks the surplus. Consult Riesser, Dr. J. (1909), 'Die deutsche Grossbanken und ihre Konzentration'; 'Germany's Economic Forces' (1913); 'Report on Co-operation in American Export Trade' (Washington 1916).

SCHADOW, shā'dō, **Johann Gottfried**, German sculptor: b. Berlin, 20 May 1764; d. there, 27 Jan. 1850. After many vain struggles to become an artist, he was admitted to the studio of the sculptor Tassaert and thus at length succeeded in devoting himself to his chosen art. Soon afterward he ran off with his sweetheart to Vienna, and there married her; and then, at the expense of his father-in-law, went to Italy, where he wrought with unwearied diligence from 1785 to 1787 in the museum of the Vatican and of the Capitol, winning a prize by his group 'Perseus and Andromeda.' In 1788 he obtained the position in Berlin which had become vacant by the death of his teacher Tassaert. His first great work was the monument erected in the Church of Saint Dorothea, Berlin, to the memory of the margrave, natural son of Friedrich Wilhelm II. This was followed by the colossal statue of Ziethen in hussar uniform; the statue of Frederick the Great in Stettin; of Leopold of Dessau in Berlin; of Blücher in Rostock; the Tauenzien monument in Breslau; Luther's in Wittenberg, etc. The four-horse chariot of Victory, over the new Brandenburg Gate of Berlin, was modeled by Schadow. Schadow executed many busts of his eminent countrymen and numerous reliefs and statuettes. In 1788 he was made rector and in 1822 director of the Academy of Art in Berlin, a position which he retained until his death. He was one of the first of the modern sculptors who dared to withstand the fantastic mannerism of the 18th century for which he substituted a powerful representation of character based on a study of the antique. His most eminent pupil in this respect is Rauch; among his other pupils may be named Dannecker, Tieck and Zauner. His chief literary works are 'Wittenberg Denkmäler der Bildnerei, Baukunst und Malerei, mit historischen und artistischen Erläuterungen' (1825); 'Polyklet, oder von den Massen des Menschen nach dem Geschlechte und Alter' (1834); 'National-physiognomien, oder Beobachtungen über den Unterschied der Gesichtszüge und die äussere Gestaltung des menschlichen Kopfs, in Umrissen bildlich dargestellt' (1835); 'Kunstwerke und Kunstansichten' (1849). Consult Dobbert, 'Gottfried Schadow' (1887).

SCHADOW, Rudolph, son of the preceding, German sculptor: b. Rome, 9 July 1786; d. there, 31 Jan. 1822. He was trained as sculptor by his father and his principal works are

'Spinning Girl'; 'Achilles and Penthesilea'; 'John Baptist' and 'Virgin and Child.'

SCHADOW-GODENHAUS, gō'dēn-hows, **Friedrich Wilhelm**, younger brother of the preceding, German painter: b. Berlin, 6 Sept. 1789; d. Düsseldorf, 19 March 1862. He received his first lessons in drawing from his father, then turned to painting and became the pupil of Weitsch. He served in the war between 1806 and 1807 and three years later resumed his artistic studies in Rome, where Cornelius, Overbeck, Veit and others had founded the new school of the Nazarenes (q.v.). He joined their company and from that time made the Italian masters his models, while the favorite subjects of his pencil were biblical, or selected from the mystical and allegorical wonders of mediæval tradition. As in the case of Overbeck, his devotion to this latter field of human imagination led him to become a member of the Roman Catholic Church. He painted 'Heaven's Queen' for Madame von Humboldt and a 'Holy Family' for the Crown Prince Ludwig of Bavaria. The best work he did at Rome is seen in the frescoes for the Casa Bartholdy; 'Jacob with Joseph's Bloody Coat'; 'Joseph in Prison' (both in the Berlin National Gallery). In 1819 he was called to Berlin as professor of the Art Academy there. During his incumbency he painted the 'Bacchanalian Procession' on the proscenium of New Theatre; many portraits; the 'Visit of the Wise Men' in the Garrison Church at Potsdam and another altar-piece for the church at Schulpforta. One of his finest pictures is 'Freeborn Poetry,' a lovely winged maiden rising from earth to heaven. In 1826 he was made director of the Academy in Düsseldorf and with a circle of enthusiastic pupils became the founder of the Düsseldorf school. He retained this connection until 1859, when age and failing sight led him to retire. Among his religious paintings are 'Christ on the Mount of Olives'; 'Christ at Emmaus'; 'The Dead Body of Christ watched over by his Mother surrounded by Angels' (1836). His health drove him to seek a change in the warmer climate of Italy (1840), and at Rome he painted 'Earthly and Heavenly Love'; 'Piety and Vanity in their Relationship with Religion,' the last appearing under the form of the Saviour, and 'Heaven, Purgatory, Hell' after Dante. As an author he wrote 'The Influence of Christianity on the Painter's Art' (1843). His paintings are mostly found in Düsseldorf and Berlin, but one of his best works, the 'Wise and Foolish Virgins,' is in the Museum at Frankfurt-on-the-Main. He was perhaps more successful as a teacher and demonstrator than as a creative artist, but he had a very distinct, even though one-sided influence, upon the religious art of Germany. He gave a new and vigorous impulse to the oil painting of his day without resorting to that pre-Raphaelite realism which sometimes lent to the canvases of Cornelius a certain crudeness bordering on the grotesque. Consult Hühner, 'Schadow-Godenhaus und seine Schule' (1869).

SCHAEBERLE, shā'bér-lé, **John Martin**, American astronomer: b. Württemberg, Germany, 10 Jan. 1853. He was brought to Ann Arbor, Mich., in his infancy, and was graduated from the University of Michigan in 1876 as a

civil engineer. He has, however, devoted himself to the study of astronomy, to which department of knowledge he has made valuable contributions. From 1876 to 1888 he taught astronomy in the University of Michigan, and was then called to the Lick Observatory at Mount Hamilton, Cal., where he made several important astronomical investigations. He had charge of the expedition to witness the eclipse at Cayenne in 1889, and of those for the same purpose to Chile in 1893, and to Japan in 1896. He is now, and has been for some years past, engaged in theoretical and experimental investigations on gravitation, light, heat and electricity. He is a frequent contributor to astronomical journals.

SCHAEFFER, Nathan C., American clergyman and educator: b. Maxatawny, Berks County, Pa., 3 Feb. 1849; d. Lancaster, Pa., 14 March 1919. In 1867 he was graduated at Franklin and Marshall College after which he studied divinity at the Theological Seminary of the Reformed Church and finished his education at the universities of Berlin, Tübingen and Leipzig. From 1875 to 1877 Dr. Schaeffer was professor at Franklin and Marshall College and from 1877 to 1893 was principal of the Keystone State Normal School. In the year last named he became State superintendent of public instruction, a post he held until his death. He also served as president of the State board of education and was president of a commission that prepared a new school code for the State, and was a member of the simplified spelling board. In 1879 he received the degree of doctor of philosophy and in 1904 received the degrees of doctor of divinity and doctor of laws from Dickinson College. He was a prolific writer on educational and religious subjects. His works include 'Thinking and Learning to Think' (1900); 'History of Education in Pennsylvania'; (editor) 'Bible Readings for Schools' (1897); introduction to Hinsdale's 'Civil Government'; Riddle's 'Nicholas Comenius'; 'Life of Henry Harbaugh,' and editor of the *Pennsylvania School Journal* after 1893.

SCHAFF, shäf, David Schley, American Presbyterian clergyman and educator, son of Philip Schaff (q.v.): b. Mercersburg, Pa., 17 Oct. 1852. He was graduated at Yale in 1873 and in 1877 was ordained in the Presbyterian ministry. He served as pastor in 1877-1907; was professor of church history at Lane Theological Seminary in 1897-1903; and since 1903 has been professor of ecclesiastical and doctrinal history there. He was a delegate to the Pan-Presbyterian Council at Aberdeen, Scotland, in 1913. He was one of the editors of the 'Schaff-Herzog Encyclopedia' (4 vols., 1883); and of 'History of the Christian Church' (Vols. I-II, 1907-10); and author of 'Commentary on Acts' (1882); 'Life of Philip Schaff' (1897); 'John Huss' (1915), etc. He translated 'The Church' by Huss (1915).

SCHAFF, Philip, American clergyman and scholar: b. Coire, Switzerland, 1 Jan. 1819; d. New York, 20 Oct. 1893. He studied at Tübingen, Halle and Berlin, and was a lecturer in the latter university in 1842-44. He then came to this country where he was professor in the theological seminary of the German Reformed Church at Mercersburg (Pa.) 1844-63.

In 1864-69 he was lecturer in several theological institutions, and in 1870 became professor of sacred literature in Union Theological Seminary, New York. This post he held until his transference in 1887 to the chair of church history in the same institution. He was one of the founders of the Evangelical Alliance and went as delegate to its general conferences at Basel in 1879, and at Copenhagen in 1884. He was president of the American Bible-revision committee, organized by him in 1871 at the request of the British committee. He was a prolific writer and editor, his works including 'History of the Apostolic Church' (1853); 'History of the Christian Church' (1867; new and enlarged edition, 7 vols., 1889-92); 'Creeds of Christendom' (1877); 'Schaff-Herzog Encyclopedia of Religious Knowledge' (as editor); 'Dictionary of the Bible' (1880); 'Church and State in the United States' (1888); 'Literature and Poetry' (1890).

SCHAFFHAUSEN, shäf'how-zën, Switzerland: (1) Capital of the canton of its own name, situated on an eminence overlooking the Rhine, 24 miles north of Zürich. It is quaintly and irregularly built. The buildings most worthy of notice are the feudal castle of Munot, of Roman construction, standing on a commanding height; the parish or Saint John's Church; and the cathedral (1052), a massive basilica containing a bell whose inscription suggested Schiller's 'Song of the Bell,' and Longfellow's 'Golden Legend'; the town-house (1412); the Imthurneum, containing theatre, concert rooms, etc., the museum containing manuscript collections of Johann von Müller, who was born here, the town library, etc. There are primary and high schools. The environs are beautiful; three miles distant are the celebrated falls of the Rhine, almost 300 feet broad, falling more than 70 feet in three cascades formed by two pillars of rock. The Fäsenstaub is a fashionable promenade. The principal industrial works are the wagon and carriage factories, cotton and woolen manufactories, iron works, distilleries and breweries. Pop. about 15,957. (2) The canton of Schaffhausen covers an area of 114 square miles, and occupies the most northern angle of the Swiss territory. It belongs to the Swabian Jura, and the population uses almost exclusively the German tongue. The canton entered the Swiss Confederation in 1501, and by the constitution of 1876 became exceedingly democratic. Education is compulsory. The taxes are very low. Financially it is the most favored among the Swiss cantons. All the cereals are raised, besides hemp and flax. There is abundance of fruit, especially grapes. The principal manufactures are aluminum, wagons, wool, ropes and watches. Pop. about 47,270.

SCHÄFFLE, shä'flē, Albert Eberhard Friedrich, German political economist and sociologist: b. Nürtingen, Württemberg, 24 Feb. 1831; d. Stuttgart, 24 Dec. 1903. He was educated for the ministry at Tübingen but adopted a journalistic career. In 1861 he was called to the University of Tübingen as professor of political economy, and in 1868 to Vienna. His principal contributions to the literature of political science are his 'National Economy' (1861-73); 'Capital and Socialism' (1870); 'The Fundamental Principles of Taxation' (1880);

and 'Quintessence of Socialism' (1884, 8th ed., 1885). In 1895 he began to write upon sociological questions and to develop the biological theory of society. His 'Bau und Leben des sozialen Körpers' is a more detailed attempt to explain society as a living organism than that essayed by any previous writer. This book, completed in 1896, placed him in the ranks of modern sociologists.

SCHAFFNER, Jakob, German novelist: b. Basle, Switzerland, 15 Nov. 1875. He carried on his university studies in his native city, and there he wrote most of his works until he changed the scene of his studies to Charlottenburg, near Berlin, in 1912. His best novels are 'Irrfahrten' (Berlin 1905; title later changed to 'Irrfahrten des Jonathan Bregger' 1912), and 'Die Erbhöferin' (Berlin 1908, 15,000 sold in two years). His early poverty is reflected in most of his works, 'Irrfahrten' ('Wanderings'), for instance, has convincing pictures from the life of working people in their daily toil, while 'Konrad Pilater' is a story of a rather whimsical journeyman shoemaker (embodying scenes of Schaffner's boyhood as a shoemaker). Later novels are 'Konrad Pilater' (Berlin 1910); 'Der Bote Gottes' (1911), and 'Die goldene Fratze' (Berlin 1912). A translation of 'The Iron Idol' appears in 'German Classics' (Vol. XIX, New York 1914).

SCHALCKEN, shāl'kēn, Godfried, Dutch artist: b. Dordrecht, 1643; d. The Hague, 16 Nov. 1706. He was the pupil of Samuel van Hoogstraten and Gerard Douw. He visited England where he painted portraits, especially one of William III. His best work is in genre, and here he approached though still remaining inferior to his master Douw. He was fond of representing scenes by candle light, though he was scarcely ever quite true in the color representation of such light. When he attempted portraits in full length, as the fashion of the time of Sir Godfrey Kneller demanded, his efforts were not successful, with the possible exception of the portrait of William III, now in the Amsterdam Museum, but he soon became sensible of his error, and again painted on a small scale. Some of his best works are at the museums of Vienna, Dresden, Munich, Berlin, Amsterdam, The Hague, and at the Louvre.

SCHAMYL, shā'mīl (SAMUEL), Tartar imam and warrior, leader among the tribes of the Caucasus: b. Aul Himri, northern Daghestan, 1797; d. Medina, March 1871. From 1824 to 1831 he took energetic part in Kasi Mollah's "holy war" against the infidel Russians, being severely wounded at the storming of Himri. A Sufi, he labored for the recrudescence of his faith in Daghestan, and was markedly successful. From 1837 he was temporal and spiritual head of the mountain tribes. His guerrilla method of warfare long enabled the Circassians to continue the struggle against Russia. During the Crimean War he was supplied by the allies with arms and money. After incredible escapes he was at last taken (6 Sept. 1859), and kept under surveillance, though treated with consideration.

SCHARF, shārf, Sir George, English artist: b. London, 16 Dec. 1820; d. Westminster,

19 April 1895. He studied art under his father, a Bavarian artist who had settled in England, and in 1838, after gaining medals from the Society of Arts, entered the Royal Academy schools. In 1840 he visited Asia Minor, and again in 1843 as draughtsman to a government expedition. On his return he devoted himself to painting in oil and to book-illustration, among the books illustrated by him being Murray's 'Prayer Book,' Macaulay's 'Lays,' Milman's 'Horace,' Kugler's 'Handbook of Italian Painting,' Layard's books on Nineveh, Keats' Poems, and Sir W. Smith's Classical Dictionaries. He rendered valuable assistance to the Crystal Palace authorities in planning the Greek, Roman and Pompeian courts, and to Charles Kean in his Shakespeare revivals of 1851-57. He was art secretary to the Manchester exhibition of 1857, and on the foundation of the National Portrait Gallery he began to make a special study of portraits, on which he soon became a recognized authority, and in 1882 he received the title of director of the gallery. His publications comprise 'Recollections of Scenic Effects' (1839), the part on sculpture in Waring's 'Art Treasures of the United Kingdom' (1857). To his great knowledge and industry the National Portrait Gallery owes almost its whole value.

SCHARF, John Thomas, American historian: b. Baltimore, Md., 1 May 1843; d. there, 28 Feb. 1898. At the outbreak of the Civil War he entered the Confederate army, was engaged in the battles around Richmond, at Cedar Mountain, the second Battle of Bull Run and at Chancellorsville, and in 1863 became a midshipman in the Confederate navy. He participated in the capture of the *Underwriter*, near New Berne, N. C., and after the blockade was established he again joined the army. While on his way to Canada with dispatches he was captured. In 1874 he was admitted to the bar, was a member of the legislature in 1878 and in 1884 he was appointed commissioner of the land office of Maryland. He was editor of the *Baltimore Telegram* and of the *Morning Herald* and wrote 'Chronicles of Baltimore' (1874); 'History of Maryland' (3 vols., 1879); 'History of the Confederate States Navy' (1887); 'Natural and Industrial Resources and Advantages of Maryland' (1885-90), etc.

SCHARNHORST, shārn'hōrst, Gerhard Johann David von, Prussian general: b. Bordenau, Germany, 12 Nov. 1755; d. Prague, 28 June 1813. He entered the Hanoverian army in 1780 and soon distinguished himself as an officer of artillery. In 1804 he was knighted by the king of Prussia, and in 1813 attained the rank of general in the Prussian army. In the reorganization of the army of Prussia in 1809-13 he proved himself an able general. The national spirit, awakened by the loss of the territories west of the Elbe, was greatly augmented by the genius of Scharnhorst, who infused the military spirit throughout the scattered populations of the Prussian domain by raising a large and well-disciplined volunteer army for the War of Liberation. In this campaign he was chief of staff under Blücher, but was mortally wounded at the battle of Lützen. Consult 'Life by Lehmann (1886-87); von Boyen, 'Erinnerungen' (1891).

SCHECHEM, shĕk'ēm, Palestine. See NABULUS.

SCHECHTER, shĕh'ter, Solomon, American theologian and Orientalist: b. Focșani, Rumania, 1847; d. 19 Nov. 1915. Participating in the rabbinical training given to Jewish children of his environment, in maturer years he attended the Berlin and the Vienna universities and was graduated as rabbi in Venice. He was reader of Semitics, Cambridge University, England, 1892-1902, and professor of Hebrew at University College, London, 1898-1902. He traveled in Italy, Egypt and Palestine and made interesting discoveries of manuscripts in Cairo of peculiar value to students of the Old Testament. He wrote 'Aboth de Rabbi Nathan' (1887); 'Studies in Judaism' (1896); 'The Wisdom of Ben Sira' (1899); 'Midrash-Hagadol' (1902); 'Saadyana' (1902); 'Studies in Judaism' (2d series, 1908); 'Some Aspects of Rabbinic Theology' (1909); 'Documents of Jewish Sectaries' (2 vols., 1911); and after 1902 was president of the Jewish Theological Seminary of New York. In 1911 Harvard conferred on him the degree of Litt.D.

SCHEDONE, shā-dō'nā, or **SCHIDONE**, Bartolommeo, Italian painter: b. Modena, about 1570; d. there, 1615. He acquired an admirable style by a careful and long continued study of Correggio, and his natural genius under the inspiration of that master enabled him to produce a great number of graceful and delicate pictures, both in fresco and oils. His portraits are the most remarkable of his productions and he painted many of the principal citizens of his native town. He also produced a great many religious paintings and was a successful etcher.

SCHEELE, shā'lē, Karl Wilhelm, Swedish chemist: b. Stralsund, 19 Dec. 1742; d. Köping, 21 May 1786. His early education was received at Gothenburg. In 1770 he was made assistant professor of chemistry at Upsala, and there became celebrated as one of the greatest scientists of his time. His independent discovery of oxygen, a few months after that of Priestley, places him in the front ranks of the early physicists. He is known also as the discoverer of tartaric acid (1770), chlorine (1774), baryta (1774), glycerine (1784), and prussic acid (1782), and, ignorant of the results of Priestley's experiments, he also claimed the discovery of oxygen (1777). A new coloring matter commonly known as Scheele's green was obtained by his experiments with arsenic. He was the author of 'Chemical Observations and Experiments on Air and Fire' (1777); 'Essay on the Coloring Matter in Prussian Blue' (1782).

SCHEELITE, native calcium tungstate. A mineral often found in crystalline quartz, associated with cassiterite, topaz, fluorite and wolframite. It is distinguished by its high specific gravity, 5.88 to 6.14, moderate hardness, 4.5 to 5, vitreous to adamantine lustre, the pyramidal hemihedrism of its tetragonal crystals, and their eminent pyramidal cleavage. Its streak is white, but its superficial colors vary greatly, white, yellowish or brownish being the most common. It is widely distributed, though not an abundant mineral, its occurrences in Bohemia, Saxony, Piedmont and England are the best known, while in Tasmania and at Trumbull, Conn., it is found in commercial quantities and

has been mined as an ore of tungsten. Molybdenum is usually present replacing part of the tungsten.

SCHEFER, shāf'ēr, Leopold, German author: b. Muskau, Lower Lusatia, 30 July 1784; d. there, 16 Feb. 1862. After a gymnasial training he devoted himself to literature, the only post he held being that of superintendent of the estates of Count Pückler, with whom he made in 1816-20 a journey to Italy and the East. His study of Oriental philosophy and religion appears in much of his verse. His works of fiction, structureless and vague in characterization, are greatly inferior to his poetry, which is collected in such volumes as 'Vigilien' (1842); 'Gedichte' (3d ed., 1846); 'Das Laienbrevier' (1834; 18th ed., 1884), and 'Der Weltpriester' (1846). The last two were turned into English by C. T. Brooks (q.v.), as 'The Layman's Breviary' (1868) and 'The World Priest' (1873). Schefer was also something of a composer, writing an opera ('Sakontala') and several quartettes. His 'Ausgewählte Werke' appeared in 1845-46 (2d ed., 1857). Consult the biography by Brenning (1884).

SCHEFFEL, shĕf'fēl, Joseph Victor von, German poet: b. Carlsruhe, 16 Feb. 1826; d. Carlsruhe, 9 April 1886. He was educated for the law at Heidelberg, Munich and Berlin, but gave up his legal career almost as soon as it was begun for that of literature. His first and greatest book, 'Der Trompeter von Säckingen,' appeared in 1854. This poetic romance of the Thirty Years' War reached its 190th edition in 1891. His second book, a romance in prose entitled 'Ekkehard' (1855), was also one of the most popular of German love stories. His other works are 'Hugideo' (1884) and 'Gaudamus' (1867-91), both romances; 'Frau Aventure' (1863-83); 'Bergpsalmen' (1870-83); 'Waldeinsamkeit' (1880). (See TRUMPETER OF SACKINGEN, THE). Consult Klar, 'Scheffel und Seine Stellung in der Deutschen Literatur' (1876); Lives of Pröess (1887); Ruhemann (1866); Pilz (1887), and Zernin, 'Erinnerungen' (1886).

SCHEFFER, shĕf'fēr, Ary, Dutch painter: b. Dort, Holland, 1795; d. Argenteuil, near Paris, 15 June 1858. At an early age he sought Paris to study for the profession of an artist. Here he became a pupil of P. Guérin. His first picture, 'Abel Singing a Hymn of Praise,' was exhibited in 1812, and at once established his reputation. In 1817 he produced the 'Death of Saint Louis'; in 1819 the 'Surrender of Calais to Edward III'; and in 1822 'Francesca da Rimini.' Of extremely versatile talents. Scheffer traversed a very wide field in the domain of art, and his pictures comprise subjects both sacred and secular, historical and imaginative. Of the first of these the most celebrated are 'Christ Blessing Little Children', 'The Agony in the Garden,' and 'Christ the Comforter.' From the writings of Goethe he has produced some admirable works, such as 'Margaret,' 'Mignon,' the 'King of Thule' and others; from Dante, 'Beatrice,' from Byron, 'Medora,' and from Schiller, 'Eberhardt.' Scheffer's pictures are principally remarkable for the refinement of expression and depth of feeling which they display. They are highly prized by collectors and a small replica of 'Paolo and Francesca da Rimini' was sold in 1870 for

\$9,607. Many of his chief works are in the Luxembourg or at Versailles.

SCHEIDEMANN, shi'dē-mān, Philip, German Socialist leader: b. Cassel, 26 July 1865. His father was a skilled artisan and the boy attended both the Bürgerschule and the Real-schule of his native city, later learning the trade of printer (1879-83). He became a member of the Social-Democratic party at the age of 18, and has been engaged in its activities ever since. In 1895 he became editor of a Socialist paper at Giessen, in 1900 at Nürnberg, later also at Offenbach and Cassel. In 1913 he toured the United States, lecturing in many cities before German-speaking branches of the Socialist party. In August 1914 he became rightly notorious through having defended the action of the Imperial German government declaring war on France and Russia, and, contrary to all the teachings of Socialism, aided in securing to the government the support of the Social-Democratic party, which published aggressive justifications of the imperialistic war and induced a chauvinistic spirit throughout the country. After the German Revolution of 7 Nov. 1918 Scheidemann was a powerful factor in the counsels of the right wing of the party, supporting the new Socialist Chancellor, Friedrich Ebert, who took office 9 November. Most of the great Socialist leaders of the country were opposed to his tactics in retaining the former Imperial Minister, Dr. Solf, in the new Cabinet, and frequent uprisings of the Berlin ultra Radicals showed this disapproval of the Scheidemann-Ebert régime, 6 Dec. 1918. Scheidemann was for a moderate revolution in Germany; he expressed his disapproval of the Russian Bolshevik Revolution in the strongest terms.

SCHEINER, shī'nēr, Christoph, German astronomer: b. at Waldt in Swabia, about 1575; d. 1650. Scheiner was professor of Hebrew and mathematics at Freiburg and at Ingolstadt from 1610-16, and after several years' residence in Rome he became rector of the Jesuit College at Neisse in Silesia. In 1612 he published his 'Tres Epistolae ad Marcum Velserum' and claimed to have seen sun spots as early as March 1611. He thus antagonized Galileo whom he further provoked by upholding the old thesis of a 'stable' earth and a 'mobile' sun. 'Rosa Ursina' (1630) was his great work on the sun and contained the results of about 2,000 observations.

SCHELDT, skēlt, or **SCHELDE**, shēl'dē (ancient *Scaldus*), a river belonging in the various parts of its course to France, Belgium and the Netherlands. It rises in the French department of Aisne, at a height of 295 feet above sea-level, in the small lake of Beaufort, near Catelet. It flows northerly to Cambria, Valenciennes, Boudain and Condé, where it first becomes navigable after junction with the Saint Quentin Canal. It enters Belgium between Montagne and Hollain, passes Doornik, Oudenarde, Ghent, Dendermonde, Rupelmonde, Tournai and Antwerp; at Ghent is joined by the Lys and the canals which connect that city with Sas and Bruges. There is considerable tide at Ghent, somewhat modified by sluices. The river makes a great bend toward Dendermonde and Antwerp, flows circuitously north forming the boundary between Antwerp and East Flanders provinces. At

Antwerp it measures 1,600 feet in width, 45 feet in depth and still wider below, forms a secure harbor, which is capable of receiving the largest ships. Again turning northward, it is finally lost in the estuaries among the islands of Zealand. After reaching the Dutch frontier it divides into the East and West Scheldt, the latter and main stream flowing into the North Sea, below Flushing. Both branches connect with the Meuse and the Rhine. The entire length of the river is 211 miles. Its principal affluents are the Haine Dender, the Rupel, the Sensée, Scarpe and Lys. The entire region traversed by the Scheldt was made memorable by the appalling operations of the Teutonic armies in the World War from the time (1914) when Germany violated the guaranteed neutrality and political integrity of Belgium by sending her armies through it to gain entrance into France.

SCHELLING, shēl'fing, Felix Emanuel, American educator: b. New Albany, Ind., 3 Sept. 1858. In 1881 he was graduated at the University of Pennsylvania, where he received the degree of LL.B. in 1883 and that of A.M. in 1884, and of Litt.D. in 1903 and LL.D. in 1909. Since 1893 he has been John Welsh Centennial professor of English literature at the University of Pennsylvania. Dr. Schelling is a member of the National Institute of Arts and Letters, of the American Philosophical Society and of the Modern Language Association of America. He has published 'Literary and Verse Criticism of the Reign of Elizabeth' (1891); 'Life and Works of George Gascoigne' (1893); 'A Book of Elizabethan Lyrics' (1896); 'A Book of 17th Century Lyrics' (1899); 'The English Chronicle Play' (1902); 'The Queen's Progress and Other Elizabethan Sketches' (1904); 'History of Elizabethan Drama' (1908); 'English Literature during the Lifetime of Shakespeare' (1910); 'The Restoration Drama' (Cambridge History of Literature, 1912); 'The English Lyric' (1913); 'A History of English Drama' (1914). He has edited 'Ben Jonson's Discoveries' (1892); 'Eastward Ho and the Alchemist' (1903); 'The Merchant of Venice' (1903); 'Macbeth' (1910); 'Beaumont and Fletcher' (1912).

SCHELLING, Friedrich Wilhelm Joseph von, German philosopher: b. Leonberg, in Württemberg, 27 Jan. 1775; d. Ragaz, Switzerland, 20 Aug. 1854. He studied theology and philosophy at Tübingen and natural science at Leipzig. His philosophy of nature as presented in 'Ideen zu einer Philosophie der Natur' (1797) and in 'Von der Weltseele' (1798), gained for him an appointment as professor at the University of Jena (1798). There he became the leading philosopher of the "early romanticists" and was highly esteemed by Goethe. In 1803 he married Caroline, the former wife of A. W. Schlegel (q.v.), and accepted a professorship in Würzburg. From 1806 to 1820 he lived in Munich as a member of the Academy of Science and also (since 1809) as general secretary of the Academy of Arts. He resumed his academic work from 1820 to 1827 at Erlangen, and from 1827 to 1841 at Munich. The theological turn of his later works induced Frederick William IV of Prussia to call him to the University of Berlin (in 1841), as a counterweight against the radi-

cal left wing of Hegel's disciples. But his lectures on mythology and revelation met with scant success and he retired in 1846. Among the ever-changing phases of his philosophical evolution two main periods may be distinguished; the first, which found its consummation in his "system of identity," is pantheistic in its general character; in the second period, beginning about 1806, he elaborates his "positive" philosophy, which rests on a theistic and theological basis.

Schelling had originally started as a disciple of Fichte's "Philosophy of the Ego," but his study of Spinoza and his own love of nature soon induced him to attempt a vindication of the external world, which Fichte had degraded by defining it as the mere "Not-self." In Schelling's *Philosophy of Nature* the external world is the preliminary stage (*Vorstufe*) of the Spirit. Nature is the unconscious side of the "Absolute" or "Infinite," just as the Spirit is its conscious side. Like Fichte, he conceives the "Absolute" as a process, as an activity (not as a substance) which continuously ascends from lower to higher forms of development. In carrying out this scheme he made use of many of the new ideas and discoveries that were then revolutionizing the natural sciences. Polarity (as exhibited in the two poles of a magnet) appears to him as the principle of all phenomena of nature. Everywhere, he sees dualism and polarity: positive and negative factors which neutralize each other, leading up to and producing a new reality. By means of repeated steps from lower to higher potencies the "Soul of Nature" (*Weltseele*) unfolds itself. The primal dualism of expansion ("imponderable matter," ether) and contraction ("ponderable matter," gravity) reveals itself more distinctly in the magnetic, electrical and chemical phenomena of the inorganic world, and in the corresponding functions of reproduction, irritability and sensibility of living organisms.

In the phenomena of sensibility the external order of things reaches its culminating point. But the same processes of polarity and evolution appear again on a different plane in the inner world of conscious existence. In his 'System of Transcendental Idealism' (1800; extracts translated in Prof. Benj. Rand's 'Modern Classical Philosophers,' 1908) Schelling represented the "Epochs of Self-consciousness" as parallel to the successive stages in the development of nature. Finally, the objective and subjective side of ourself (or the theoretical and the practical attitude of the mind, or intellect and activity) are carried to their harmonious union in the world of art and poetry. In art the human mind achieves the actual synthesis of the conscious and the unconscious. Art is the organ of the true philosopher; his highest aim must be a new mythology, which is to unite philosophy and poetry in objective representation.

The first period of his philosophy found its final expression in his "system of identity," as set forth in the 'Darstellung meines Systems' (1801), in the platonic dialogue 'Bruno' (1802) and in the 'Methode des akademischen Studiums' (1803). Merely comprehended by the analytical and formal faculty of the intellect, the universe divides itself into the two great

regions variously denominated as Nature and Self, Matter and Spirit, Real and Ideal. But the connecting faculty of reason or "intellektuale Anschauung" (intellectual sight or perception, which is akin to the "intuition" of artistic genius) shows the antithesis of the two regions as only relative. Both are originally and essentially One; they are only two different forms of manifestation of the One Infinite. The Infinite or Absolute is the eternal Identity of the Real and the Ideal, which are the two poles of the Absolute. The process of the Universe consists in the splitting up of the original "absolute Indifference" into the opposites that were latent in it, and in the striving for a reunion of the "differences" in an ultimate absolute Identity. This active process of the Absolute, ascending from "indifference" through polar differentiation toward "identity," is also conceived by Schelling, in this period, as identical with the evolution of God.

After 1806, Schelling gradually became convinced that this rationalistic pantheism, which he now stigmatized as "negative," must find its counterpart and consummation in a "positive" system. The "thread of dialectical movement may be sufficient as a guide through the world of the purely rational but it breaks as soon as it takes the weighty step into reality," into the world of empirical specification. Here the contingent must be added to the necessary, and rational knowledge must be supplemented by irrational, but definite, experience of a higher order, which acquires the character of "Revelation." The creation of the World is now the free act of a supernatural and personal God; the actual or contingent world has come into existence by a mystical falling away from the original identity in which it lived in the bosom of the Absolute and Divine Being. Schelling's 'Essence of Human Freedom' (1809) shows clearly the influence of Jacob Böhme's theosophy. His 'Philosophy of Mythology and of Revelation,' published after his death, consists of mystical speculations about pagan mythology and Christian doctrines. He distinguishes a Petrine and a Pauline Christianity which are represented in the Catholic and Protestant churches. Both are dominated by the Johannine theology which is the highest form of Christianity.

As an eclectic of the highest order, Schelling assimilated and welded into an imposing synthesis such divergent types of human thinking as Kant, Spinoza, Leibniz, Fichte, Plato, Bruno, Böhme, Plotinus and the Gnostics. His philosophy of nature alone gained an immediate and powerful influence, not only in Germany, where Goethe, the romanticists and most of the scientists considered him as their philosophical spokesman, but in the rest of Europe also through disciples like Coleridge and V. Cousin. His conception of one continuous process of evolution which would embrace in successive steps the lifeless and the living world, was a great philosophical anticipation and did much to promote a scientific study of nature. But his method of reasoning by suggestive analogies and, in general, the artistic turn of his mind brought him into discredit among the younger school of exact scientists. For a time it was customary to deride him as the founder of "speculative physics." But many of his leading

ideas have since been vindicated before the scientific world.

(ed.), 'Schelling's Werke' (Auswahl in 3 Bänden, Leipzig 1907).

TRAUGOTT BÖHME.

SCHENCK, shēnk, Carl Alwyn, American forester: b. Darmstadt, Germany, 25 March 1868. He studied at Darmstadt and Tübingen, and was graduated from the University of Giessen. He was forest assessor of the grand duchy of Hesse, served in the German army, came to the United States in 1895, and became director of the Biltmore Forest School and forester to George W. Vanderbilt's Biltmore estate. He wrote 'Our Yellow Poplar' (1896); 'Forestry for Kentucky' (1899); 'Forest Utilization' (1904); 'Biltmore Lectures on Sylviculture' (1905); 'Forest Management' (1907); 'Forest Policy' (1911), etc.

SCHENCK, Robert Cumming, American diplomat: b. Franklin, Ohio, 7 Oct. 1809; d. Washington, D. C., 23 March 1890. He was graduated at Miami University in 1827, and remained there as tutor until 1830. In that year he became a student of law in the office of the Hon. Thomas Corwin at Lebanon, Ohio, and was admitted to the bar in 1831. He began the practice of law at Dayton, Ohio, and soon achieved marked success in his profession. In 1840, during President Harrison's "Log Cabin" campaign, he was elected to the legislature of Ohio, and entered upon his political career. He soon became a leader in the Whig party, and was recognized throughout his section as an able and effective public speaker. In 1843, after an exciting political contest, he was elected to his first term in Congress, retaining his seat until 1851, and becoming one of the most prominent leaders of his party at Washington. In 1851 he was appointed United States Minister to Brazil, where he remained some years, and performed important diplomatic service.

When the Civil War began he promptly offered his services to the government, and received a commission of brigadier-general of volunteers. He was severely wounded at the second battle of Bull Run, and his right hand and arm permanently disabled. He was later promoted to the rank of major-general, and served in the army until December 1863, when he resigned his commission to accept a seat in Congress, to which he had been elected in the fall of 1862 over Clement L. Vallandigham (q.v.). General Schenck's military and political abilities were at once recognized and he was appointed chairman of the Military Committee of the House and rendered important and ardu-

ous services. He was three times elected to Congress. He served as chairman of the Committee on Ways and Means and became the leader of his party in the House. On 22 Dec. 1870 he was appointed Minister to Great Britain by President Grant, a position which he filled with distinction until 1876. During this term of service he was appointed member of the historic Joint High Commission which assembled at Washington, and provided by treaty for the Geneva Conference, a measure that resulted in substituting arbitration instead of war in the settlement of the serious controversies that had arisen between Great Britain and the United States, regarding the Alabama claims and other important subjects. His tact and force, and his knowledge of international law, were most useful in determining the great questions involved.

SCHENCK, William Edward, American clergyman: b. Princeton, N. J., 29 March 1819; d. Oakenout, Pa., 14 Dec. 1903. He was graduated from Princeton in 1838, from the theological seminary there in 1841 and was ordained in 1843. He was engaged in pastoral work in New Jersey and New York until 1852, was secretary of the Presbyterian Board of Publication in 1854-86 and its editor in 1862-70, and from 1865 was a director of Princeton Theological Seminary. He published 'Historical Account of the First Presbyterian Church of Princeton, N. J.' (1851); 'Church Extension for Cities' (1854); 'Nearing Home' (1863); 'The Fountain for Sin' (1864); 'Children in Heaven' (1867), etc.

SCHENECTADY, N. Y., city, county-seat of Schenectady County, on the Mohawk River, new Barge Canal and on the New York Central and Hudson River and the Delaware and Hudson railroads, 16 miles west of Albany. It has connection with the Boston and Maine Railroad at Scotia and with the West Shore Railroad at South Schenectady. Local lines connect the city with Troy, Mechanicville, Saratoga Springs and other nearby places. That part of the city along the bank of the river is the oldest; most of the modern buildings have been erected on the surrounding heights.

Buildings and Municipal Improvements.—The principal public buildings are the post office, county courthouse, municipal buildings, Van Curler Opera House, a State armory, Home of the Friendless, Children's Home, Ellis Hospital, the Young Men's Christian Association building and the church and school buildings. The location, in the Mohawk Valley, is in a fertile agricultural region. The slope to the river is such as to make the natural surface drainage almost sufficient, but a good sewerage system has been introduced. The water is distributed by means of the Holly system.

Manufacturing.—Figures relative to the number employed here show a total of over 26,000. Unlike many other cities all but 2,000 of these are employed in two large industries.

The census of 1914, like that of 1909, with reference to manufactures, excluded the hand trades, the building trades and the neighborhood industries, and took account only of establishments conducted under the factory system. In the last census, also, as in that for 1909, statistics were not collected for establishments having products for the census year

valued at less than \$500, except that reports were taken for establishments idle during a portion of the census year, or which began operation during that year and whose products for such reason were valued at less than \$500. Schenectady is also the headquarters for the General Electric Company and for the American Locomotive Company whose plants in this city alone are employing 24,000.

Summary for the City.—A comparative summary for the city for 1909 and 1914 follows:

	Census		Per cent of increase, 1909-1914
	1914	1909	
Number of establishments	184	134	37.3
Persons engaged in manufacturing	21,262	17,728	19.9
Proprietors and firm members	176	120	46.7

Churches and Schools.—There are 70 churches, embracing all denominations. The educational institutions are Union University (q.v.), 24 public schools, two parish schools, two business colleges, three private schools, a free public library and the college and high school libraries.

Banking and Finances.—There are two national banks with a combined capital of \$200,000, a savings bank with deposits of about \$5,500,000 and two trust companies with \$500,000 capital and surplus. The annual cost for municipal maintenance and operation is about \$850,000.

History.—Schenectady was settled in 1661 by Arent Van Culer, and letters patent were granted in 1684. On 8 Feb. 1690 the place was attacked by a force of French and Indians, who massacred all but 60 of the inhabitants and burned the town. In 1765 it was incorporated as a borough and in 1798 chartered as a town. In 1819 a disastrous fire destroyed nearly all the business portion of the city. Among the early steam railroads in the United States was one from Albany to Schenectady. The water communication by means of the Mohawk, increased by the new Barge Canal and the railroad communication at an early date, all contributed toward making the city a commercial and industrial centre. It has increased steadily in population and industries. Pop. (1880) 13,655; (1890) 19,902; (1900) 31,682; (1910) 72,826; estimated population (1914) 91,000.

SCHENK, Leopold, Austrian embryologist; b. Urmény, Hungary, 23 Aug. 1840; d. Schwanberg, Styria, 17 Aug. 1902. He was graduated at Vienna in 1865 and was appointed assistant professor of embryology there in 1873. He attained world-wide notoriety and the centre of the medical profession generally for his theories concerning sex control of the embryo through the diet of the mother. He also worked the theory into an elaborate plan

for control of the development of the race. He was eventually forced to resign his position in the university. Besides several textbooks he was author of 'Einfluss auf das Geschlechtsverhältniss des Menschen und der Thiere' (1898; Eng. trans., 'The Determination of Sex,' 1898).

SCHENSCHIN, shēn'shīn, Afanasij Afanasjewitch, Russian poet; b. Mzenek district, government Orel, 4 Dec. 1820; d. Moscow, 4 Dec. 1892. He studied at Moscow, was in the army in 1853-56, then devoted himself wholly to literature, and under the pseudonym 'A. Fet' published several collections of lyrical verse (1840, 1850, 1863, 1883-91). He also made excellent renderings from Shakespeare, Goethe and the Latin classics.

SCHERER, shā-rār, Edmond (Henri Adolphe), French critic; b. Paris, 8 April 1815; d. Versailles, 16 March 1889. He studied at the law faculty of Paris, took a course in theology at Strassburg, entered the Protestant ministry in 1840 and in 1845 became professor of exegesis in the Ecole Evangelique, Geneva, popularly known as L'Oratoire. This he resigned in 1849 and became a leader in the liberal movement in Protestant theology. He was elected to the National Assembly from Seine-et-Oise in 1871 and became life-senator in 1875. In both chambers he was a prominent representative of the left centre. He was made chief literary critic of the *Temps* in 1860, later its editor. He took rank as a brilliant though opinionated critic, his reputation in this field having been made by a series of articles on important thinkers and writers of other literatures in the *Revue des Deux Mondes*. Among his writings in book form are 'Dogmatique de l'Eglise Réformée' (1843); 'La Critique et la Foi' (1850); 'Alexandre Vinet, sa vie et ses écrits' (1853); 'Etudes Critiques sur la Littérature Contemporaine' (1863-89); 'Diderot' (1880), and the posthumous 'Etudes sur la Littérature au XVIIIe Siècle' (1891). He also wrote a biography of Melchior Grimm (1887). Consult the study by Gérard (1890); article by Dowden in the *Fortnightly*, Vol. XLV (1889); Fisher, 'A Group of French Critics' (1897).

SCHERESCHEWSKY, shkēr-ēs-kūs'ki, Samuel Isaac Joseph, American Protestant Episcopal bishop; b. Tanrooggen, Lithuania, Russia, 6 May 1831; d. Tokio, Japan, 1906. He studied in Russia and Germany, and, after coming in 1854 to the United States, at the Western Theological Seminary (Allegheny, Pa.) and the General Theological Seminary; was ordained deacon of the Protestant Episcopal Church in 1859, priest in 1860 and was a missionary in China in 1860-75. In 1877 he was consecrated third Protestant Episcopal bishop of China, but he resigned his office in 1883 and afterward resided in the United States, China and Japan. With J. S. Burden he translated the 'Book of Prayer' into Mandarin, and he also prepared a complete revision of the Mandarin Bible (1895) and a wholly new rendering of the Bible into Wenli, the classical language of China (1902).

SCHERMERHORN, shkēr'mér-hörn, Martin Kellogg, American Unitarian clergyman; b. Durham, N. Y., 20 March 1841. He was educated at Williams College and at Union Theological Seminary, was ordained to the

Presbyterian ministry in 1867, held Unitarian pastorates in 1871-84 and Protestant Episcopal rectorships in 1885-96 and returned to the Unitarian ministry in 1897. He has published 'Ancient Sacred Scriptures' (1882); 'Sacred Scriptures of the World' (1898); 'Thoughts for the Twentieth Century' (1900); 'Universal Worship' (1904); 'World-Religion' and 'World-Religion Hymns and Prayers' (1914), etc.

SCHERR, shēr, **Johannes**, German author and literary critic: b. Hohenrechberg, Swabia, 3 Oct. 1817; d. Zürich, Switzerland, 21 Nov. 1886. He was educated at the University of Tübingen and in 1843 settled in Stuttgart, where he became a teacher. He allied himself, politically, with the Democrats among whom he became a leader; in 1848 he was elected to the assembly and in the revolution of that year he took so prominent a part that he was compelled to flee to Zürich in 1849. He was appointed professor of history and literature in the University of Zürich in 1860, holding the position until his death. His works are characterized by their caustic wit and many peculiarities in point of diction. His writings include 'Geschichte der deutschen Literatur' (1854); 'Michel, Geschichte eines Deutschen unserer Zeit' (1858); 'Deutsch Kultur und Gittengeschichte' (1852); 'Geschichte der deutscher Frauenwelt' (1860); 'Blucher, seine Zeit und sein Leben' (1862-63), etc.

SCHIAPARELLI, skyā-pā-rēl'lē, **Giovanni Virginio**, Italian astronomer: b. Savigliano, 5 March 1835; d. Milan, 5 July 1910. He was educated at the University of Turin, and later studied at Berlin, under Encke, and at Pultowa, Russia, under Struve. Returning to Italy in 1859, he became assistant astronomer at the Milan Observatory, and its director in 1862. In 1861 he discovered the asteroid Hesperia. His discoveries of the relations between comets and falling stars were published as 'Note e riflessioni sulla teoria astronomica delle stelle cadenti' (1867). In 1877 he published the first accounts of his observations of the "canals" of Mars, to which his name has been given. He published many books on astronomy.

SCHIAVONE, skyā-vō'nā, **Andrea** (THE SLAVONIAN), Italian painter whose original name was MELDOLLA (MEDOLLA or MEDULA): b. Sebenico, Dalmatia, probably in 1522; d. Venice, 1582. In youth he was placed with a house-painter in Venice, where in leisure hours he studied the works of Parmegiano, Giorgione and Titian. The latter took him under his care, and later employed him in the library of Saint Mark, where he is said to have painted three entire ceilings. Later he was accounted one of the finest colorists of the Venetian school. Among his works are two parables and two landscapes in the Berlin Museum, 'Christ before Pilate' in the Venice Gallery, 'Christ before Caiaphas' (Vienna), 'Parnassus' (Munich), and numerous other specimens to be seen in collections at Florence, Rome, Naples, Dresden, Paris and Petrograd. His 'Perseus and Andromeda' and 'The Apostles at the Sepulchre' are in the royal collection at Windsor. He also etched 119 plates, making use of some soft material, probably tin.

SCHIEDAM, shē-dām', Netherlands, in the province of South Holland, a seaport near

the influx of the Schie into the Maas, four miles west of Rotterdam. Of the old walls four gates have been preserved. The town is intersected by numerous canals, and though irregularly built has broad streets and many good houses. Its chief buildings are the Reformed and other churches, a fine exchange, town house, a handsome concert hall, schools of language, art, business, etc., a public library and various hospitals. The principal manufacture is the Geneva gin or Hollands. Prior to the World War there were over 220 grain and other distilleries in constant operation. Other manufactures were linen, thread, copper and iron castings, white lead and litharge, cordage and vinegar. There was considerable traffic in gin, grain and coal. Pop. about 35,166.

SCHIEFFELIN, shēf'ē-lin, **Bradhurst**, American druggist and publicist: b. New York, 21 Sept. 1824. He entered the wholesale drug manufacture, and in 1860 placed petroleum on the market. During the Civil War he organized a committee of prominent citizens for consultation with and support of President Lincoln, and in the financial troubles succeeding the war was active in charities. The Bread and Shelter Society, for sending destitute persons from cities to rural districts for their self-support, was organized by him, and he personally sheltered and fed thousands. With Charles O'Connor and Horace Greeley he formulated the petition introduced into Congress by Roscoe Conkling, for the prevention of the appropriation for the use of religious corporations of public moneys or property.

SCHIFF, shīf, **Jacob Henry**, American banker and philanthropist: b. Frankfort-on-the-Main, Germany, 1847. He came to New York in 1868, where he entered a banking house and became in a few years head of the firm of Kuhn, Loeb and Company. His leadership in finance was quickly acknowledged and his firm has been identified with many prominent enterprises. He has devoted a large portion of his wealth to charitable and educational purposes and among his most noted benefactions are the Semitic Museum at Harvard University, and in New York the Nurses' Settlement, the Young Men's Hebrew Association building and the Jewish Theological Seminary. He is president of the Montefiore Home for Chronic Invalids of New York; vice-president and trustee of the Baron de Hirsch Fund; member of the American Museum of Natural History; the Metropolitan Museum of Art; the American Society of Fine Arts, and is an ex-vice-president of the New York Chamber of Commerce. He has long been associated with movements for civic reform.

SCHILLER, shīl'lēr, **Ferdinand Canning Scott**, English philosopher: b. 1864. He was educated at Balliol College, Oxford, and at Cornell University. In 1893-97 he was an instructor at Cornell; afterward returning to Oxford, where he was tutor and Fellow of Corpus Christi College after 1903. He gained a wide reputation as an exponent of pragmatism, which he discusses under the term humanism. He contributed to magazines and reviews and was author of 'Riddles of the Sphinx' (1891); 'Humanism' (1903; 2d ed., 1912); 'Plato or Protagoras?' (1908); 'Formal Logic, a Scientific and Social Problem' (1912), etc.

SCHILLER, Johann Christoph Friedrich (von), German dramatist, poet, historian and philosophic thinker: b. Marbach in Swabia, 10 Nov. 1759; d. Weimar, 9 May 1805. His father was an officer in the army of the Duke of Württemberg, his mother a pious housewife nowise distinguished above her kind. The parents early decided to fit their son for the priesthood in the Lutheran Church. To this end they sent him to the Latin school at Ludwigsburg, which was then the ducal residence. Duke Karl Eugen was conspicuous among the German princelings who aped the style of the Bourbon kings, Ludwigsburg being his Versailles. Here he maintained a costly opera, spent large sums on building projects and governed through mistresses and adventurers. The boy Schiller had thus a good opportunity to observe the ways of petty autocracy under the old régime, and he used his eyes to good advantage. Presently the duke experienced a change of heart, became an exponent of virtue and went in for works of benevolence. In this spirit he founded a military academy which was to train the sons of his officers for the public service. That he might have the boys under his own eye and mold them to his liking, he assembled them under his own roof in his castle "Solitude," where for a time he played the schoolmaster with them. His offer of a scholarship to the boy Schiller was a princely favor not to be rejected by the loyal parents, though it involved giving up their plan of making him a pastor. To this school the lad went in 1773 and started in as a student of law, but floundered badly at first. After two years the school was transferred to Stuttgart, where it became virtually a university minus the theological faculty. A medical faculty was now added, and to secure students certain *élèves* (French was the official language of the school) were allowed to go over to medicine. Schiller, who had been at the foot of his class, eagerly accepted this chance. From this time (1775) on he devoted himself with average assiduity and success to medical studies. In 1780 he was honorably dismissed, but without a doctor's degree.

The discipline of the school was severely military. The students were kept under constant surveillance, their reading was censored and their quarters often searched for contraband books. But they found ways to smuggle in the forbidden literature, which of course tasted the sweeter for the prohibition. It is certain that young Schiller read nearly all the revolutionary productions—works of the so-called "storm and stress,"—that were just then coming out. They soon raised his incipient radicalism to the boiling-point. A friend called his attention to a magazine story by Schubart dealing with a pair of enemy brothers, a theme just then in favor with the literary radicals. The hint was enough. Schiller, who by this time felt sure that the writing of tragedy was to be his vocation, began to pen his 'Robbers,' in which a dissolute but soft-hearted young nobleman named Karl von Moor, while leading a wild life as a Leipzig student, receives a harsh letter from his dotard father telling him that he is disinherited. Driven to fury by the missive and not suspecting the machinations of his scoundrel brother, Franz, he puts himself at the head of a band of

scapegrace students and leads them to the Bohemian Forest, where they become outlaws and run amuck against society. Moor robs and murders on a terrific scale, yet not for vulgar gain. He tries to correct the inequalities and injustices of the social order, imagining that he is doing a righteous work as the avenger of the poor and oppressed, and fully believing that God is on his side. When he learns the truth he gives himself up to the law which he has outraged. Thus the play is a tragedy of fanaticism, and as such it marks the emergence of a new dramatic type. It has glaring faults of extravagance and overemphasis, but is none the less the work of a born dramatist, all clearly visualized for action and powerfully bodied forth. It was chiefly the fame of this thunderous play that led, in the course of time, to Schiller's being made an honorary citizen of the first French republic. There is an authentic tradition that in reading the scenes of the nascent 'Robbers' to his spellbound fellow-students, he would sometimes snort and roar and stamp in the white heat of his indignation.

Toward the end of 1780 he left the academy and was made army doctor to a regiment of invalid soldiers stationed at Stuttgart. The service was disagreeable and poorly paid. To increase his pittance of an income he borrowed money and published the play he had written, letting it appear anonymously as a book for the reader. It made no great stir as mere literature, but caught the attention of Dalberg, director of a theatre at Mannheim, who suggested a revision for the stage. Schiller complied and the new version was played at Mannheim in 1781 with memorable success. The audience went wild over the performance and the obscure army doctor at once emerged into the glare of notoriety, though he had saddled himself with a debt which was destined to afflict him for years. After such a success he was naturally disposed to try again. He wrote a second play, on the abortive conspiracy of Fiesco at Genoa in 1547, conceiving it at first rather vaguely as a "republican tragedy." Meanwhile he had got into serious trouble with his lord and master, the duke. In the first place, he had left his post without permission in order to attend the first performance of the 'Robbers' at Mannheim. Secondly, a passage in the published play had given offense in Switzerland and led to public complaints. The result was that Schiller was given two weeks in the guardhouse and forbidden to write any more "comedies." This was too much. He decided to quit Württemberg. One evening in September 1782 he stole away clandestinely with a friend named Streicher, a musician who afterward published an account of the episode. Under assumed names the pair went first to Mannheim, where Schiller read his new 'Fiesco' to Dalberg's actors and received the humiliating verdict that it was worthless and could not be played. He had ruined its effect by his bad reading, and besides that the politic Dalberg was in no haste to befriend a runaway who had quarreled with the ruler of a neighboring state. Schiller was now technically a deserter and had very good reason to fear that he would be pursued and put under arrest. So he took refuge at Bauerbach, near Meiningen, occupying a house that had

STATUE OF SCHILLER, BY BEGAS, BERLIN

been put at his disposal by a friendly lady named Henriette von Wolzogen. At first he went under the name of Dr. Ritter and scattered misleading letters as to his whereabouts, but his friends soon learned where he was and it became evident that the Duke of Württemberg was taking no steps to have him arrested. Being now free for his favorite employment, he wrote a third play, which he at first called 'Luise Miller,' afterward 'Cabal and Love,' and sketched a fourth, which was to be known as 'Don Carlos.'

In the summer of 1783 he returned to Mannheim under a year's contract as theatre-poet, Dalberg having become convinced that there was no danger to be feared from Stuttgart and hoping that the new plays would repeat the huge success of the 'Robbers.' In due time 'Fiesco' was put on the stage with moderate success, but not as a "republican tragedy." By a stroke of the pen its author had given it a happy ending. Instead of being slain as a selfish usurper by the fanatical republican Verrina, Fiesco is made, in the moment of his triumph, to cast off his ducal robes and bid the Genoese embrace him as their happiest fellow-citizen. This ending clearly supports the republican idea, but we are hardly prepared for such a turn by the preceding trend of the play, which makes Fiesco continually vacillate between republican idealism and the lure of personal aggrandizement. 'Cabal and Love' is a tragedy of class-conflict and incidentally a drastic comment on the ways of German courts and courtiers. A high-minded nobleman falls in love with a fiddler's daughter and wishes to marry her in spite of her humble birth. But his father, who has risen by crime to the presidency of the ducal council, will have none of such a misalliance and concocts a vile plot to force his son into a marriage with the duke's mistress. This is the "cabal." The plotters succeed in making Ferdinand madly jealous, so that he poisons Luise and then commits suicide. In writing the play Schiller had the Württemberg court in mind, and little touches here and there reflect actual history. But the duke himself does not appear and there are no telltale names. 'Cabal and Love' has many strong scenes and is the only class-conflict play of that epoch which is still alive on the German stage. But its effect is marred at the last by the fatuous conduct of the tongue-tied heroine, who forfeits sympathy by her seeming lack of common sense.

The three plays just considered, all written in prose and characterized by a vehement, high-keyed diction, are the most important yet not the sole expression of Schiller's youthful radicalism. While still living in Stuttgart he started a magazine called the *Württemberg Repertory*, for which he wrote a number of minor papers. He also published a so-called *Anthology for the Year 1782* containing numerous short poems. The dominant note of Schiller's early verse is a certain high-pitched vehemence which is apt to suggest poetic feigning. He is as far as possible from the simple realistic manner of the young Goethe, having a marked fondness for soaring and sonorous diction.

At the end of his first year in Mannheim the contract with Dalberg was not renewed, so that Schiller found himself in the summer of

1784 without income and without prospects. He was oppressed by debt and generally unhappy. Mannheim had become a prison. He decided to try his fortune by starting a dramatic magazine to be known as the *Rhenish Thalia*, but hardly had he launched it when he was called away from the Rhine country by a friendly message from Gottfried Körner, a young lawyer just then living in Leipzig. After a short sojourn in the university town Schiller followed his new-found friend to Dresden, where he remained nearly two years in intimate association with the Körner family. He continued to publish his magazine, now called simply *Thalia*, and at the same time worked in a desultory fashion on his 'Don Carlos.' This he had originally planned as a love-tragedy in a king's household, purposing incidentally to scourge the Spanish Inquisition. But the mood of the revolutionist and special pleader gradually gave way to the serener ambition of the poet and he decided to write his new play in verse, as Lessing had lately done in the case of 'Nathan.' In the illusory hope of receiving valuable criticism he began to publish it piecemeal in successive numbers of the *Thalia*. As he worked his mind changed, important characters began to appear in a new light and the centre of gravity shifted. The result was that the very long play completed in 1787 was something very different from the one he had conceived four years before. 'Don Carlos' is a tragedy of political idealism wrecked by a passion for intriguing methods and would-be heroic foolhardiness. The weightiest character is not the nominal hero, but the Marquis Posa, who pleads with Philip II of Spain to grant the Netherlands freedom of thought and to end the Spanish régime of force and terrorism. Posa is a humane idealist of the 18th century and voices Schiller's own convictions as matured by his intercourse with Körner. Viewed in its relation to its author's personal development 'Don Carlos' occupies a middle position between the rather crude realism of his early prose plays and the matured art of his later and more famous poetic dramas. In 'Don Carlos' his peculiar sonorous diction begins to show itself at its best. But the play as a whole suffers from a lack of simplicity and clearness. It is too long and complicated for the three hours' traffic of the stage.

In the summer of 1787 having tired of his dependence on Körner, Schiller decided to try his fortune in Weimar, whose duke had previously given him the title of councillor. Goethe was then in Italy, but the visitor soon made the acquaintance of Herder and Wieland. Ere long he decided to settle in Jena and devote himself to the writing of history. He had now lost touch with the stage and his experience with it had been on the whole disappointing. On the other hand, he had become very much enamored of historical study, and his reading for 'Don Carlos' had given him a special interest in the great Dutch-Spanish conflict of the 16th century. He planned a bulky treatise of six volumes on the subject, but only wrote one. It was published in 1788 under the title 'Defection of the Netherlands.' The book is brilliantly written, the author's sympathies being obviously with the Dutch in their struggle for freedom, and contains a number

of splendid literary portraits. But Schiller got his information rather easily and made no very careful study of the sources. His merit as a historian has been often attacked and as often defended. At any rate he made literature out of history, the first achievement of that kind in the German language. His success as a historian led to his appointment, through Goethe's influence, to a professorship at the University of Jena. But hardly had he entered on his academic duties when a dangerous illness shattered his health. He never fully recovered, but led henceforth the circumspect life of a semi-invalid. A gift by the Duke of Augustenburg freed him temporarily from pecuniary anxieties—he was now married to the dowerless Charlotte von Lengefeld—and he resolved to devote his freedom to the study of Kant. He felt that critical thinking had largely destroyed his imaginative spontaneity and that the only possible cure lay in a further study of fundamentals: the "rules" must repair the damage they had wrought. So for several years he devoted himself about equally to history and philosophy, writing rather copiously in both fields. In the former we have his 'History of the Thirty Years' War,' which he conceived as a revolt of the Protestant princes of Germany against the centralizing despotism of the house of Hapsburg. It is eminently readable, especially where it treats of the great Swedish king who is Schiller's hero. He also wrote a number of minor historical papers. To enliven the columns of his *Thalia* he published in it his one attempt at prose fiction, the 'Ghostseer,' a fragmentary yarn which exploits various phases of contemporary interest in the supernatural. It is fair to call it a yarn because he himself never took it seriously and even called it a "Sudelei." In general, this period of Schiller's life is rather barren of poetic production. To it belong, however, the 'Gods of Greece' and the 'Artists,' two of his weightiest and most famous poems. The former is an elegy on the lost beauty of Greek polytheism, the latter a glowing tribute to the influence of art in the upward evolution of human kind. In the philosophic domain Schiller devoted himself mainly to the theory of beauty and its relation, on the one hand to art, on the other to conduct. Setting out from Kant's analysis of beauty in the 'Critique of Practical Judgment,' Schiller reached the conclusion that beauty is fundamentally freedom-in-the-appearance. He set forth his doctrine and its implications in a number of rather forbiddingly abstruse essays, of which the most interesting one, perhaps, is that entitled 'Über Anmut und Würde' ('On Winsomeness and Dignity'). In a more popular and readable form his philosophy of art is expounded in his 'Letters on Esthetic Education' and his famous essay on 'Naïve and Sentimental Poetry.'

In 1794 began the famous friendship of Schiller and Goethe. For seven years the two men had lived as mutually indifferent neighbors, each acquainted with the other's work but neither caring for a closer relation. A casual meeting at a scientific lecture put an end to this mutual aloofness, explanations and visits ensued and ere long they were close friends and literary allies. Goethe became a frequent contributor to Schiller's magazine *Die Horen*

and took a keen interest in its success. But it did not succeed and after three years was discontinued. It was largely their irritation over this failure that led the two men to unite in the literary campaign of the 'Xenia,' a collection of epigrams in the ancient distich form, wherein they paid their respects to men and tendencies they did not like. Nearly a thousand of the distichs were written and about half that number were published in 1797 in Schiller's *Musen Almanach*, where they caused great excitement. There was a shower of 'Anti-Xenia,' to which the perpetrators of the original "Teufelei" (as they called it) paid no attention. They agreed that the published 'Xenia' should be included in the works of both, and that they would give no information as to their separate authorship. Some of the epigrams are sharply censorious, others without any sting at all. The majority, relating as they do to men and matters of ephemeral interest, now seem rather pointless. Their chief historical importance is that they caused Schiller and Goethe to be generally regarded as militant allies fighting the same battle. The two men came to be known as the Dioscuri.

Schiller had now definitely returned to poetry. In conjunction with Goethe he made a study of the epic style and out of this study grew a number of ballads and romanzas which are among the most popular of his works. Special favorites of those who enjoy this phase of Schiller's art are the 'Diver,' the 'Pledge,' the 'Glove' and the 'Cranes of Ibycus.' To this period belong also a group of reflective poems in which he gave expression to the humane idealism and high ethical aspiration which characterize his mature thinking. In this domain he is at his best in the 'Ideal and Life,' the 'Walk' and the 'Song of the Bell.' But his fame rests mainly on his poetic dramas. As director of the little Weimar theatre Goethe was glad to avail himself of his friend's insight and experience in matters of the stage. Schiller, who became a resident of Weimar in 1799, gave assistance in selecting and adapting plays and gradually enriched the local repertory with five creations of his own which are the pride of the German classic drama. He began 'Wallenstein' in 1796, at first purposing to make it a play of ordinary length. The material proved refractory since it dealt only with what Schiller called the cold passions (ambition, hate, malice, vindictiveness), and also because it involved idealizing and creating dramatic sympathy for a traitor. Schiller met the first difficulty by inventing a pair of romantic lovers and managing the plot in such a way that the spectator is forced to see Wallenstein through their partial eyes; the second by giving to Wallenstein a certain loftiness of soul, making much of all the extenuating circumstances and surrounding him with inferior men among whom he towers like a giant among pigmies. The result is that a rather repellant character becomes grand in his final isolation and pitiful downfall. On the whole Wallenstein is the most impressive tragic hero created by any German dramatist. As Schiller's interest in the man and his times deepened the material grew on his hands until he decided to present it in three parts called 'Wallenstein's Camp,' the 'Piccolomini' and 'Wallenstein's Death.' It is, however, no

trilogy in the Greek sense, but a portentously long tragedy in 10 acts, preceded by a dramatic prologue.

Next came 'Mary Stuart,' indubitably the best for the stage of all the many plays in divers languages dealing with the famous Queen of Scots. Here the problem, as Schiller saw it, was to create genuine tragic sympathy for his heroine, but without extenuating her conduct and so making a distinctly Catholicizing play. He solved the problem by concentrating the plot into the last few days of Queen Mary's life and introducing her as a woman whose conscience is heavily burdened by the admitted crimes of long ago, but who feels that in her present plight she is the victim of rank injustice. As she is helpless to avert her impending fate, her situation, according to Schiller's conception of dramatic art, is pathetic rather than tragic. It was necessary to make her in some sense visibly responsible for her calamity. To meet this dramaturgic difficulty Schiller resorted to two unhistoric inventions: first, Queen Mary's attempt to escape at the instigation of the Catholic renegade, Mortimer, this attempt endangering the life of Queen Elizabeth; secondly, a meeting of the two queens at which Mary loses control of herself and puts a deadly insult on her rival. This scene is the stage-climax of the play, but its psychological climax comes in the fifth act, when Queen Mary humbly accepts her ignominious death as a divinely appointed expiation for the sins of long ago. While the play's appeal is thus shifted from politics to religion and made to rest on a purely human basis that is neither Catholic nor Protestant, there is much in it that indicates Schiller's artistic sympathy with the Catholicizing tendency of the new romantic movement just then acquiring momentum. The portrait of Elizabeth is little better than a caricature.

Still more marked is the Catholicizing drift in the 'Maid of Orleans,' which was given the subtitle of "romantic tragedy" for the very reason that it requires us to accept the supernaturalism of the legend at its face value. Schiller follows the tradition rather closely except that he makes Joan's "voices" enjoin virginity as a condition of success in her patriotic mission, and that he departs radically from history in respect to the manner of her death. In his view of the matter tragic guilt of some kind was indispensable to tragedy; so he makes Joan fall strangely in love with the English general Lionel just as she is about to take his life on the battle-field. From that instant, feeling that she has violated the spirit of the divine command, she loses her self-confidence and with it her supernatural power. After great suffering and humiliation, which supposedly expiate her offense, she recovers her power by a miracle and dies in glory on the field of battle fighting for France. In this bold romanticization of the Maid's character it was Schiller's deliberate intention to idealize her and rescue her from the obloquy cast upon her by Voltaire's 'La Pucelle.'

His next play was the 'Bride of Messina,' in which he attempted to find a substitute for the Greek chorus. He invented a mediæval plot in which two brothers fall in love with the same girl, who is in reality their sister. She has been brought up in seclusion, her existence un-

known to them, in order to defeat the dire prediction of soothsayers. Jealousy and mutual antipathy lead on to the death of both. Schiller provides each brother with a band of retainers who take part in the action and also function as semi-choruses, each speaking through a chosen leader. In what they say an attempt is made to imitate the detached attitude and lofty moralizing of the Sophoclean chorus. Schiller's noble poetic diction is at its very best in the 'Bride of Messina' and especially in the so-called choral passages; but it is evident that words spoken by one person, without group-singing or group-dancing, could convey hardly more than a dim suggestion of the old Greek chorus. Schiller's example has not been imitated and the 'Bride of Messina' is but rarely played.

Last came 'William Tell,' the most popular of all Schiller's plays. It is this stirring and intensely human drama dealing with the revolt of the Swiss farmers against the tyranny of their Austrian governors that has led to the idealization of its author as poet of freedom. It has no hero but the Swiss people, it lacks unity, it violates several of the most approved rules of dramaturgy. Yet there is an appealing charm about it which seldom fails to please, whether it is read as literature or seen upon the stage. After the completion of 'William Tell' in 1804 Schiller addressed himself to a new play on the story of the false Demetrius, reputed son of Ivan the Terrible. He made careful studies of Russian history, sketched numerous scenes and completed the better part of two acts. In the midst of this work on 'Demetrius' he contracted the illness which led to his premature death.

Schiller has always been regarded as the greatest of German dramatists. He had but little of the lyric gift and wrote no songs that have become highly popular. Fastidious critics have often taxed him with being a rhetorician rather than a poet, but anything like posing or insincerity was quite foreign to his nature. His personal character endeared him to all who knew him and he lived his life on a high plane of thought and feeling. His aspiring idealism has always appealed particularly to the young; so that his writings, popularized by school and theatre, are, or at least were, for the Germans a great educative force. His name, linked habitually with Goethe's, stands for all that is best in the best epoch of German letters. See SONG OF THE BELL; WALLENSTEIN; WILLIAM TELL.

Bibliography.—There is a vast quantity of literature pertaining to Schiller; consult Vol. V of Goedeke's 'Grundriss zur Geschichte der deutschen Dichtung' and the survey in the Appendix to Thomas's 'Life of Schiller.' Only a few outstanding titles can be mentioned here, and these, owing to blockade conditions created by the Great War, must be restricted to works that were published prior to its beginning.

The first complete edition of Schiller's works was that of his friend Körner, 12 vols., 1812-15. This formed the basis of the later Cotta editions which appeared in different forms and different degrees of completeness. Down to about 1868 these were rather uncritically edited. Between 1868 and 1872 appeared the Historisch-kritische Ausgabe, 15 vols., edited by Goedeke and others. To the same period belongs the

cheap popular edition issued by Hempel, in Berlin — well edited but unsightly. Good later editions are those of Boxberger and Birlinger, forming part of Kürschner's *Deutsche National-Literatur*, 12 vols., and of Bellermann, 14 vols., 1895 ff. Of special merit is the *Säkular-Ausgabe*, 16 vols., 1904. The numerous letters of Schiller, where his style was at its best in Goethe's opinion, have been well edited by Jonas, 7 vols., 1892 ff. Editions of the separate plays, issued by competing publishers for school and college use, are numerous but cannot be listed here.

Biographies short and long are almost legion. Of the early ones those by Carlyle (1825) and by Karoline von Wolzogen, the poet's sister-in-law (1830), are still interesting, as is also the booklet 'Schiller's Flucht von Stuttgart' (1836) by his friend and fellow-traveler, Streicher. Between 1838 and 1842 Hoffmeister brought out his monumental treatise in five volumes, which was followed by the shorter work of Viehoff (1846) and Schaefer (1853). The centenary jubilee of 1859, at which Schiller was glorified as the poet of freedom by Germans all over the world, brought forth a mass of more or less eulogistic literature. Of the longer biographies dating from this epoch of Schiller enthusiasm the best is that of Palleske (1858-59), of which an English translation by Lady Wallace was published in 1860. Less fervid and also less readable are the biographies by Düntzer (1881) and Hepp (1885). Highly learned biographies, going deep into all sorts of minutiae, were begun by Minor (2 vols., Berlin 1890) and by Weltrich (three instalments in one volume, 1899), but have remained unfinished. The same is true of the less exhaustive work of Brahm (Vol. I, 1892). An excellent illustrated life of Schiller is that of Wychgram (1891). Of solid merit also is the little book of Harnack (1898), the larger one by Kühnemann (5th ed., Munich 1914) and the two-volume treatise by Berger (8th ed., Munich 1914). In English, aside from translations, there are short biographies by Boyesen (New York 1882), Sime (Edinburgh 1882) and Nevins (New York 1889); also a longer one by Thomas (New York 1901). The best translations of the poems are those of Bulwer Lytton (London 1844) and Arnold Foster (1902).

Noteworthy special studies (but the list is far from complete) are the following: Bellermann, 'Schiller's Dramen' (2 vols., 1898-99; 3d ed., 3 vols., Berlin 1905-08); Köster, 'Schiller als Dramaturg' (Leipzig 1891); Tomaschek, 'Schiller in seinem Verhältnisse zur Wissenschaft' (1862; which won a prize offered by the Vienna Academy); Harnack, 'Die klassische Aesthetik der Deutschen' (Berlin 1892); Rieger, 'Schillers Verhältnis zur französischen Revolution' (Berlin 1885); Wilm, 'The Philosophy of Schiller in its Historical Relations' (Boston 1913), and Ludwig, 'Schiller und die deutsche Nachwelt' (Berlin 1909).

CALVIN THOMAS,

Professor of Germanic Languages and Literatures, Columbia University.

SCHILLER, in mineralogy, a peculiar lustre due to reflection from the surfaces of minute enclosed crystals, probably of goethite. It is best illustrated by sunstone (q.v.), and is also noticed in bronzite, hypersthene and labradorite.

SCHILLING, shīl'ling, Johannes, German sculptor: b. Mittweida, Saxony, 23 June 1828; d. 1910. He studied art at Berlin and Dresden. In 1868 he became professor at the Dresden Royal Academy. His chief works include the 'Four Seasons' at Dresden, statues of Schiller at Vienna, of Maximilian at Trieste, the War Memorial at Hamburg and the German National Monument on the Niederwald, opposite Bingen on the Rhine, which bears a colossal figure of Germania, and the statue of Wilhelm I at Wiesbaden (1894).

SCHINDLER, shīn'd'ler, Solomon, American rabbi: b. Niesse, Silesia, 24 April 1842; d. 5 May 1915. He came to America from Westphalia in 1871, having been for some years out of sympathy with orthodox Judaism, and, after a period of struggle in his adopted country, became known as one of the leaders of the advance movement among Hebrew religionists. He was called to the congregation of Adeth Israel in Boston, Mass., in 1884. In this pastorate he continued nearly 20 years, during which time he not only helped to liberalize the Hebrew faith but to promote a better understanding between American Hebrews and Christians than had before existed. In 1895-99 he was superintendent of the federated Jewish charitable organizations of Boston; in 1899-1909 superintendent of the Leopold Morse House; he then retired. He was author of 'Messianic Expectations and Modern Judaism'; 'Dissolving Views of the History of Judaism'; 'Young West, a Sequel to Bellamy's Looking Backward,' etc.

SCHINKEL, shīn'kēl, Karl Friedrich, German architect and painter: b. Neuruppin, Brandenburg, 13 March 1781; d. Berlin, 9 Oct. 1841. He was educated at the gymnasium of his native town, and after 1795 in that of Berlin. He became a pupil of Professor Gilly, and on the death of the latter in 1798 succeeded to his private practice as an architect. At the same time he continued his studies, and in 1803 he went with this object to Italy, returning in 1805 by way of France to Berlin. The period of the war being unfavorable for architecture, he took to landscape painting, and from 1808 to 1814 painted a series of dioramas for Gropius. On the return of the royal family to Berlin some of his designs for alterations in the palace were adopted and carried out. In 1811 he was admitted to the Academy, and in 1820 became a professor at the Academy. The designs to which chiefly he owed his architectural reputation include those of the royal guardhouse, the 'Memorial' of the War of Liberation, the new theatre, the new Potsdam Gate, the artillery and engineers' school, all in Berlin; and the observatory; the casinos in Potsdam and Glienicke; and a large number of castles, churches and minor public buildings. As a painter he produced numerous wall and easel pictures. His 'Primeval History of Mankind' in the vestibule of the Berlin Museum exhibits him to advantage as a wall painter. His landscapes are chiefly architectural views, of which the best known are the 'Theatre at Taormina'; 'Square of Saint Mark's, Venice'; 'Ocean Caves near Sorrento'; 'The Cathedral at Milan'; 'Interior of Saint Peter's, at Rome'; 'The Capitol by Moonlight.' He exercised a

profound influence over every department of the art production of his day, including carpet and furniture making. His taste was strictly classical, but while he reproduced some of the purest forms of Greek art of the Periclean Age, he also occasionally chose the motifs both of mediæval and Renaissance architecture as elements in his designs. These designs, with his own comments and explanations, were published in different forms, his principal work being 'Sammlung architektonischer Entwürfe' (1820).

SCHIRMER, shîr'mër, **Johann Wilhelm**, German artist: b. Jülich, Rhenish Prussia, 5 Sept. 1807; d. Karlsruhe, 11 Sept. 1863. He studied historical painting under Schadow at the Düsseldorf Academy until he came under the influence of Lessing's landscapes, whereupon he turned to that *métier*, producing historical landscapes after the manner of Poussin. In 1830 he became assistant professor, and in 1839 professor at the Düsseldorf Academy, meantime visiting and painting in Belgium, the Black Forest, Switzerland, Holland, Normandy and Italy. In 1853 he became director of the art school at Karlsruhe. Among his works are six Biblical landscapes, with the 'Life of Abraham,' National Gallery, Berlin; 'Grotto of Egeria,' 'Nether German Landscape,' Leipzig Museum; series of 26 Biblical landscapes, Düsseldorf Gallery; 'Via Mala,' four landscapes with story of Good Samaritan; 'Storm on the Campagna,' Karlsruhe Gallery.

SCHIST (crystalline), a metamorphic rock generally found only in regions which have been subjected to regional or dynamic metamorphism, that is, those in which the strata have suffered intense folding and shearing. The general characteristics of schists are the fine and pronounced lamination, and crystalline character of component material. They grade on the one hand into gneisses and on the other into scarcely altered mica slates or sandstones. The more important varieties are broadly classified, according to the principal ferro-magnesian silicate present. Thus we have: (a) Mica schists; (b) Hornblende schists or Amphibolites, and (c) various minor schists. The mica schists range in silica from over 80 per cent to less than 50 per cent, according to the amount of quartz present. The most prominent and abundant minerals of this variety are quartz, muscovite and biotite, which are more or less distributed in layers. Among the other minerals present are feldspars, both orthoclase and plagioclase, the rock thus approaching gneiss; garnet, often in large and well-formed crystals; staurolite, cyanite, sillimanite, tourmaline, varying from black through blue, green, red, to white, often of the precious type; opalite, pyrite and magnetite. The term Hydromica schists is used commonly for the finer varieties, in which the scales of mica are indistinguishable (sericite, peragonite, etc.). These pass imperceptibly into phyllites. Mica schists result largely from the metamorphism of sandstones, shales and clays, but also through crushing and excessive shearing of igneous rocks. They are found over wide areas in New England, the Appalachians, Lake

Superior and the West. The Hornblende schists or Amphibolites generally result from the dynamic metamorphism affecting igneous or pyroclastic rocks, and rarely from ordinary sedimentary rocks. Hornblende here takes the chief place, quartz being normally absent, while biotite and the basic feldspars are characteristic constituents. Garnet, magnetite, pyrite and other basic minerals are also common. These schists occur as belts in other metamorphic rocks, generally representing dikes, sheets, flows, or ash beds in the sedimentary series. They occur in New England and other Eastern States, and are important in the mineral regions of Lake Superior. They also occur in the Black Hills, and in the Rocky Mountain and California ranges. Among the minor schists may be mentioned chlorite schist, talc schist, epidote schist and others. In each of these, the mineral giving name to the rock is more or less admixed with quartz, feldspars and numerous other minerals. They probably result most commonly from the alteration of igneous rocks, and are found in the older metamorphic districts. See FOLIATION; METAMORPHISM.

SCHIZÆA, skî-zē'a, the typical genus of the family *Schizæaceæ*, ferns widely distributed, mostly in tropical regions, and which are small and distinct in habit. The sporangia have an entire apical ring and are sessile in close distichous spikes along the middle veins of the narrow pinnae of the fertile fronds; the sterile fronds are linear, fan-shaped or dichotomously many-cleft. *S. pusilla*, the curly-grass, is the only species in North America, and is very rare and local, being found only in the pine-barrens of New Jersey and Nova Scotia. Its fertile one-sided fronds form the most conspicuous part of this tiny plant, the twisting linear sterile fronds being very like grass. See FERNS AND FERN ALLIES.

SCHIZOPODA. See CRUSTACEA; OPOS-SUM-SHRIMP.

SCHLATTER, shlät'tër, **Michael**, American German Reformed clergyman: b. Saint Gall, Switzerland, 14 July 1716; d. near Philadelphia, Pa., November 1790. He was educated at the University of Helmstedt, taught for several years and then entered the German Reformed ministry. He offered his services as a missionary to the German Reformed emigrants in Philadelphia in 1746, and went to Pennsylvania in that year. He served as pastor of the united churches of Germantown and Philadelphia in 1746-51, organized a synod which met in Philadelphia in 1747 and made extended missionary tours through Pennsylvania, Maryland, Virginia, New Jersey and New York. He visited Europe in 1751, secured a much needed reinforcement of six young preachers, substantial aid in the way of money and returned in 1752. As a result of his appeal £20,000 was raised in England and Holland for the establishment of schools among the Germans in America, and in 1755 Schlatter became superintendent of the enterprise, but in 1757 he resigned because of the opposition encountered from the Germans, who objected to the teaching of the English language in the schools. In 1757 he was appointed chaplain of the Royal American regiment, and

remained with the army until 1759. He then preached at Chestnut Hill and surrounding places. In 1777, while still attached to the royal army, he refused to obey orders on account of sympathy with the colonial cause and was imprisoned. Consult Harbaugh, Henry, 'Life of Rev. Michael Schlatter' (1857).

SCHLEGEL, shlä'gël, **August Wilhelm von**, German critic, poet and translator: b. Hanover, 5 Sept. 1767; d. Bonn, 12 May 1845. At the University of Göttingen he received a thorough philological training under Heyne and became an admirer and friend of Bürger, with whom he was engaged in an ardent study of Dante, Petrarch and Shakespeare. From 1791 to 1795 he was tutor in a Dutch family at Amsterdam. Soon after his return to Germany he settled in Jena (1796), following an invitation of Schiller. His critical contributions to Schiller's *Horen* and to the *Jenaer Allgemeine Literatur-Zeitung*, together with his translations from Dante and Shakespeare, established his literary reputation and gained for him a professorship at the University of Jena (1798). His house became the intellectual headquarters of the "romanticists," and was visited at various times between 1796 to 1801 by Fichte, Friedrich Schlegel, Schelling, Tieck, Novalis and others. From 1798 to 1800 he and his brother Friedrich edited the *Athenäum*, a periodical intended to express the "romantic" view of life and literature. In 1801 he went to Berlin, where he lectured before distinguished audiences on the æsthetic and philosophical creed of the romanticists. In 1804 he began to accompany Mme. de Staël, as tutor to her sons and adviser in her literary work, on her extended travels in Switzerland, France, Italy, England and Scandinavia. Mme. de Staël's book 'De l'Allemagne' shows distinct traces of his influence. In 1808 he was in Vienna and delivered his celebrated 'Vorlesungen über dramatische Kunst und Literatur' (pub. 1809-11). In 1813-17 he acted as secretary to the crown prince of Sweden, after which he joined again the household of Mme. de Staël until her death in 1817. In 1818 he became professor at the University of Bonn. He founded a special printing office for Sanskrit and edited several old Indian texts. As an Orientalist he was unable to adapt himself to the new methods opened by Bopp. As a critic he carried on the tradition of Lessing and Herder. Without possessing Lessing's power of style and personality he commanded a wider range of artistic susceptibility. His unerring linguistic and historical scholarship and the calm objectivity of his judgment enabled him to carry out, even more successfully than Herder himself, Herder's demand that literary criticism should be based on a sympathetic penetration into the specific individuality of each poetic production rather than on the application of preconceived æsthetic standards. He established models for the new method of analytical and interpretative criticism in his essays on Goethe's 'Hermann and Dorothea' and on Shakespeare's 'Romeo and Juliet.' His Vienna lectures 'On Dramatic Art and Literature' were translated into most of the languages of Europe and stand as a permanent contribution to critical literature; his definition of the terms "classic" and "romantic" met with general recognition; his views on the

so-called "three unities" and on the "correctness" of Shakespeare evoked an especially strong echo in England and finally made the Johnsonian attitude toward Shakespeare appear obsolete.

Formal perfection of language is the chief merit of his poems, which suffer from a lack of originality. In his drama 'Ion' (1803) he vainly attempted to rival Goethe's 'Iphigenie.' He prided himself on being "model and master in the art of sonnets" among the Germans. He is at his best in sparkling literature parodies such as 'Ehrenpforte und Triumphbogen für Kotzebue' (1801).

His universal receptivity for poetical values, together with his rare facility of linguistic expression, predestined him to be a translator of the first order. His translations from Shakespeare were his greatest artistic contribution to German literature. It is due to him that Shakespeare is hardly less known in Germany than he is in England. Only 17 plays of the so-called Schlegel-Tieck Shakespeare were translated by Schlegel (1797-1810); the remainder were added, from 1825 to 1833, by Graf Wolf Baudissin and (very inadequately) by Dorothea Tieck, while Tieck himself acted only as a reviser and annotator. Schlegel also translated parts of Dante's 'Divina Commedia' (1791-97). His 'Blumensträusse, italiänischer, spanischer und portugiesischer Poesie' (1804) included Petrarca's sonnets. The two volumes of 'Spanisches Theater' (1803-09) introduced five plays of Calderon into German literature. His theoretical essays on the art of translating have guided several generations of German translators. His breadth of culture made him truly a "cosmopolitan of art and poetry." As a critic and as a translator he has lastingly contributed to the realization of Goethe's idea of a "Welt-Literatur."

His first wife, Caroline Michaelis (1763-1809), whom he married in 1796, was the widow of Dr. Böhmer. She was the most brilliant among the "romantic" women. She assisted Schlegel in some of his literary productions, and the publication of her correspondence in 1871 established for her a posthumous reputation as probably the greatest of German letter-writers. She separated from Schlegel in 1801 and became the wife of the young philosopher, Schelling, soon after.

Bibliography.—Schlegel's 'Sämtliche Werke' have been edited in 12 volumes by E. Böcking (1846); 'Vorlesungen über schöne Literatur und Kunst' (ed. by Minor, 3 vols., 1884); 'Œuvres écrites en français' (3 vols., 1846). Consult Strauss, D. Fr., 'Kleine Schriften' (1862); Haym, R., 'Die romantische Schule' (1870; new ed., 1914); Huch, Ricarda, 'Blütezeit der Romantik' (1899); 'Caroline, Briefe aus der Frühromantik' (ed. by Erich Schmidt, 2 vols., 1913); Sidgwick, Mrs. Alfred, 'Caroline Schlegel and her Friends' (1889); Bernays, M., 'Zur Entstehungsgeschichte des Schlegelschen Shakespeare' (1872); Genée, R., 'A. W. Schlegel und Shakespeare' (1903); Gundolf, F., 'Shakespeare und der deutsche Geist' (1911); Helmholtz, A. A., 'The Indebtedness of S. T. Coleridge to A. W. Schlegel' (1907).

TRAUGOTT BÖHME.

SCHLEGEL, Karl Wilhelm Friedrich von, German critic and philosophical writer,

brother of A. W. Schlegel: b. Hanover, 10 March 1772; d. 11 Jan. 1829. As a student at Göttingen and Leipzig he was a voracious reader, especially of the classics. In his earliest publications, including the important essays 'Von den Schulen der griechischen Poesie' (1794); 'Über die Diotima' (1795); 'Über das Studium der griechischen Poesie' (1797), he appeared as a brilliant classical scholar and as an ardent worshipper of the objective harmony of "pure Hellenism." His unfinished 'Geschichte der Poesie der Griechen und Römer' (1798) had a lasting influence on the modern conception of the æsthetic values of Homer. But Schiller's distinction of two separate artistic types (the "naïve" and the "sentimental"), together with the consciousness of his own disharmonious self, caused him to discard his "graecomania." In Jena and in Berlin, where he alternately resided between 1796 and 1802, he was deeply influenced by Fichte, Schleiermacher and Schelling. During this period he wrote his essay 'On Goethe's Wilhelm Meister' (1798), his 'Gespräch über die Poesie' (1800) and a great mass of aphorisms, published as 'Fragmente' and 'Ideen.' Most of these works appeared in the *Athenæum*, which he conducted conjointly with his brother from 1798 to 1800. They are now generally recognized as the deepest and most significant expressions of the subjective idealism of the early romanticists. Most of their peculiar catchwords have been created by F. Schlegel. To him, religion is identical with "Bildung," with the free and endless cultivation of each man's individuality toward the "divine centre." "Romantic poetry" should be "progressive Universalpoesie"; it should give, in endless progression, intimations of the infinite through earthly symbols. "Romantic irony" is the necessary state of mind that enables us to recognize the appearances of life and poetry as mere "allegories" of infinite meanings. F. Schlegel was extremely fertile in discovering and illuminating new problems in the psychology of art, literature and ethics, so that he has been frequently called the forerunner of Nietzsche. But his mystical and paradoxical terminology made these "fragments" almost unintelligible to the general public, until Wilhelm Schlegel simplified and systematized his brother's ideas in his Berlin and Vienna lectures. Friedrich's eccentric novel, 'Lucinde' (1799), in which he extolled the union of sensual and spiritual love as an allegory of the divine cosmic Eros, caused a great scandal by its manifest autobiographical character, and contributed to the failure of his academic career in Jena. In 1802 he went to Paris, where he edited a monthly periodical, *Europa*, and began the study of Sanskrit. His book 'Über die Sprache und Weisheit der Indier' (1803) was the first scholarly treatment of its subject. After having embraced the Catholic faith he went to Vienna (1808), where he was employed in several official and diplomatic positions. Having gained the confidence of Metternich he secured the appointment as Austrian counsellor of legation at the Diet of Frankfort (1815). In 1818 he was again at Vienna. His later works, including 'Geschichte der alten und neueren Literatur' (1815), 'Philosophie des Lebens' (1828) and 'Philosophie der Geschichte' (1829) show an increasingly

dogmatic standpoint in religious questions and reactionary tendencies in politics.

His wife, Dorothea (1763-1839), was the daughter of Moses Mendelssohn, the Jewish philosopher. In 1798 she left her first husband, the banker Veit, in order to become F. Schlegel's devoted "comrade" and literary helpmate. She published the products of her own pen, including the novel 'Florentin' (1801), under her husband's name; her adaptations of 'Merlin the Magician' (1804) and of 'Loher and Maller' (1805) have been included in Bohn's English edition of Schlegel's collected works. The 'Sämtliche Werke,' published in 15 volumes (1846), excluded the most important works of his pre-Parisian period. His 'Prosaische Jugendschriften,' on which his fame now rests almost entirely, were collected in two volumes by J. Minor (1882). Good selections ('Fragmente') were edited by E. von der Leyen (1904); 'Briefe an seinen Bruder Wilhelm,' ed. by Walzel (1890); Haym, R., 'Die romantische Schule' (1870; new ed., 1914); Wernaer, R. M., 'Romanticism' (1910); Joachimi, 'Die Weltanschauung der Romantik' (1905); Rouge, J., 'Frédéric Schlegel et la genèse du romantisme allemand' (1904); Enders, C., 'F. Schlegel' (1913).

TRAUGOTT BÖHME,

Professor of Greek and History.

SCHLEICHER, shli'hér, August, German philologist: b. Meiningen, 19 Feb. 1821; d. Jena, 6 Dec. 1868. He devoted himself to the study of theology and Oriental languages, first at Leipzig and afterward at Tübingen. In 1846 he took the degree of doctor of philosophy at Bonn, and soon after qualified himself as a teacher of philology, to which he ever after devoted himself. In 1850 he was called to Prague as extraordinary professor of philology, a chair soon exchanged for that of comparative philology. At Prague he made himself more fully acquainted with the Slavonic languages and undertook a several months' journey to Lithuania in order to learn the Lithuanian language. In 1857 he accepted the appointment of honorary professor of the science of language and Old German philology in the University of Jena, where he continued until his death. He published a work on the comparative history of languages, 'Zur vergleichenden Sprachengeschichte' (1848), and another containing a systematic review of the European languages, 'Die Sprachen Europas' (1850). Later works are 'Die Formenlehre der kirchenslawonischen Sprache, erklärend und vergleichend dargestellt' (1853); 'Handbuch der litauischen Sprache' (1856-57). 'Zur Morphologie der Sprache'; 'Die deutsche Sprache' (1860); 'Kompendium der vergleichenden Grammatik der indogermanischen Sprachen'; 'Die Darwinische Theorie und die Sprachwissenschaft'; 'Ueber die Bedeutung der Sprache für die Naturgeschichte des Menschen' (1865).

SCHLEIDEN, shli'dèn, Matthias Jakob, German botanist: b. Hamburg, 5 April 1804; d. Frankfort, 23 June 1881. He was educated for the law in Heidelberg, but in 1833 took up the study of botany. He occupied the chair of botany at Jena from 1839 to 1863, when he was called to the Botanical Gardens at Dorpt. He was one of the first botanists to study plant

tissue, and his name is associated with that of Nageli, the Swiss botanist, in the early development of the cell theory. His works include 'Grundzüge der wissenschaftlichen Botanik' (1842-43; trans. into English as 'Principles of Scientific Botany,' 1849); 'Die Pflanze und ihr Leben' (1848); 'Baum und Wald' (1870); 'Die Rose' (1873).

SCHLEIERMACHER, shlī'ēr-māk'ēr, Friedrich Ernst Daniel, German theologian and philosopher: b. Breslau, 21 Nov. 1768; d. Berlin, 12 Feb. 1834. He was educated by the Moravian Brethren at Niesky. In 1787 he began at Barby the study of theology, which he continued at Halle. In 1794 he was ordained and appointed assistant preacher at Landsberg on the Warthe. From 1796 to 1802 he was chaplain in the Charité-Haus at Berlin. During this period he translated some of Plato's Dialogues, contributed to the *Athenæum* conducted by the two Schlegels, and wrote the 'Discourses on Religion,' the 'Monologues' and 'Letters of a Minister out of Berlin.' In 1802 he published his first collection of sermons, which was followed by two others. In 1802 he removed to Stolpe, where he wrote his 'Critical View of Ethics.' In 1804 he was appointed extraordinary professor of theology at Halle. In 1807, when Halle was separated from Prussia, he went to Berlin and lectured there as well as preached. In 1809 he was appointed preacher at the Trinity Church in Berlin. With Fichte and W. von Humboldt he took a prominent part in the founding of the University of Berlin (1810) and remained, until his death, one of its most distinguished and successful professors. In 1811 he was elected a member of the Academy of Sciences and in 1814 secretary of the philosophical class. His liberal political activity and also his advocacy of doctrinal liberty as a basis of union between the Lutheran and Reformed churches procured him the disfavor of the Prussian government. As a preacher and writer he attracted a large and influential following, especially among the cultured classes, through the eloquent beauty of his style, through his broad interest in the intellectual and artistic movements of his time and through a rare combination of deep religious feeling with critical freedom toward traditional dogmas and conventional morality.

His 'Discourses on Religion, addressed to the educated among its despisers' (1799), show him under the influence both of Spinoza's pantheism and of Kant's criticism. Dissatisfied with the popular rationalistic theology of his times no less than with Kant's moralistic interpretation of religion, he assigns to religion a special province of the human soul, conceiving it to differ essentially from the intellectual and ethical sphere of our mind. Religion, therefore, is neither knowledge nor practice, but a state of feeling, an elevating tone of the whole mind. One of the main characteristics of religious experience is the feeling of being one with the All, the sentiment of an all-embracing and all-absorbing life. This "intuition (*Anschauung*) and feeling of the universe" does not imply any specific religious creed, not even the belief in a personal God or in the immortality of the soul. It merely establishes an emotional relation of oneness between the individual and the All; the finite self feels its absolute dependence upon the infinite. But this cosmic emotion con-

stitutes, according to Schleiermacher, only one manifestation of religious sentiment; its equally important counterpart is the "self-intuition" and "self-determination" of a man's own "eternal self." Thus he reasserts the value of human personality, which had been somewhat neglected in Kant's system.

In his 'Monologues' (1800) he assimilates, from the monadology of Leibniz, the idea that each individual is an independent mirror of mankind as a whole and is destined to realize within itself the common ideal in an individual example. Each one should represent mankind in his own way, that is the first principle of morality. But the individual comes to life only in the whole. Thus Schleiermacher, contrary to Kant's ethical formalism, attaches great importance to the actual contents and results of morality, to existing institutions of culture and morality such as the family, society, church, state, arts, sciences, historical religions. The establishment of a higher order of things through the combined individual effort of human beings in human society becomes the central idea of his religious ethics. In his later writings, especially in his 'Christian Morality' and 'Christian Faith' the free philosophical religiousness of his 'Discourse' and 'Monologues' gave way to a more definite appreciation of the historical or "positive" religions and their consummation in Christianity. He finds in the person of its founder a living presentation of the endless process at the end of which appears the union of the divine and the human. By such interpretation he is enabled to adopt the Christian Church as a gradual realization in practice of the divine order of things, of the *Civitas Dei*. All positive affirmations with reference to the Deity he held to be figurative and anthropomorphic. In his 'Life of Jesus,' which anticipated that of D. F. Strauss in important respects, he appears as one of the first representatives of the critical school of Biblical research. His 'Dialektik' assumes the identity of thinking and being as the indispensable presupposition of all knowledge. His works on psychology, on æsthetics, on pedagogy have recently won renewed attention. Schleiermacher occupies a unique position as a representative alike of philosophy and theology. Practically all the modern endeavors to investigate the function of religion in the life of the human soul can be traced back to Schleiermacher. He is generally regarded as the greatest theologian of the Protestant Church since the time of the Reformation. His works have been published in three series entitled 'Theology' (11 vols.), 'Sermons' (10 vols.), 'Philosophical and miscellaneous writings' (9 vols.), Berlin 1836-65. Otto Braun edited an excellent critical selection from his works in four volumes (1910-13). The 'Discourses' and the 'Monologues' have been published in separate editions. Consult Dilthey, 'Leben Schleiermachers' (1870); 'Schleiermacher's Life, as unfolded in his Autobiography and Letters' (tr. by T. Rowan, London 1860, 2 vols.); Bender, W., 'Schleiermachers' Theologie' (2 vols., 1876-78); Lichtenberger, 'History of German Theology in the 19th Century' (1889); Pfleiderer, 'Protestant Theology in Germany since Kant' (1890); Troeltsch et al., 'Schleiermacher, der Philosoph des Glaubens' (1910); Cramaussel, 'La philosophie religieuse de Schleiermacher' (1908);

Siegmund-Schultze, 'Schleiermacher's Psychologie' (1913).

TRAUGOTT BÖHME.

SCHLESINGER, slēs'in-jēr, Frank, American astronomer: b. New York, 11 May 1871. He was graduated at the College of the City of New York in 1890 and took his Ph.D. at Columbia in 1898. He was an observer in charge of the International Latitude Observatory, Ukiah, Cal., in 1898, and in 1899-1903 he was astronomer at Yerkes Observatory. Since 1903 he has been the head of the Allegheny Observatory at the University of Pittsburgh. He is author of numerous papers on variations of latitude, spectroscopic binaries, stellar parallaxes and the reduction of astronomical photographic plates.

SCHLESWIG, shlāz'vīg, Germany, a seaport in the province of Schleswig-Holstein, Prussia, at the head of the Schlei, 29 miles northwest of Kiel. It resembles a Dutch town in point of architecture and is divided into three parts—the Altstadt, or Old Town, the Lollfuss and the Friedrichsberg. The only square is the market-place in the Altstadt. The principal street, two miles long, is the Lollfuss. The buildings of importance are the three churches, of which the cathedral (12th century) is a fine Gothic pile, with a tower 368 feet high. Other buildings are the old castle, various benevolent institutions and the Convent for Noble Women. At the south are the remains of a wall erected by pagan kings against the invasion of Jutlanders. As early as the 9th century the city was a great mart for exchange of goods between the countries of the North Sea and those of the Baltic. The chief manufactures are woolen goods, laces, sugar, earthenware and leather. There are seven annual fairs. Pop. 19,905.

SCHLESWIG-HOLSTEIN, shlāz'vīg-hōl'stīn, Germany, a maritime province of Prussia, between Denmark on the north; the Baltic, Lübeck and Mecklenburg on the east; Mecklenburg and the territory of Hamburg on the south; Hanover southwest and the North Sea on the west. It covers an area of 7,340 square miles. Schleswig is separated from Holstein by the Eider and the Schleswig-Holstein Canal. The province includes several islands in the Baltic and North seas and belongs to the great North German plain. Heligoland belongs to the province. The hilly district on the eastern coast contains the most productive land in the province; the central part is nearly barren, the western coast is protected by many dikes, and is fertile. The Baltic Coast, about 300 miles long, is hilly and contains numerous fjords which make excellent harbors. The North Sea Coast is low and flat. The Elbe forms the boundary on the south for 65 miles. The Eider is the principal river. Other rivers are the Trave and Stor. There are numerous lakes in the northeast, chief of which are Witten-See and Gotteslogs-See. The chief occupations of the inhabitants are agriculture and stock-raising. The majority of the occupants of Schleswig are Danish; of Holstein, German. The industrial works include sugar refineries, breweries and distilleries. The principal ports are Altona, Heligoland, Kiel, Flensburg, Neumühlen, Sonderburg, Wyck and Tønning, and the capital, Schleswig. The province became a united

duchy in 1386. By the Treaty of Prague, North Schleswig was to choose between Denmark and Prussia, but the privilege has been ignored. Its history is a record of continuous strife between Danes and Germans, closing in favor of the latter. The united government of Holstein and Schleswig was first recognized by Margaret of Denmark in 1386, and the basis of this union was the Succession Act, and the practical contradiction between their feudal duty and their own inseparable connection gave rise to the celebrated "Schleswig-Holstein question," causing interminable separations and fusions. By the protocol of 1850 England, France, Austria, Russia, Sweden and Denmark settled, as far as diplomacy could, the much-discussed and difficult question of the duchies of Schleswig and Holstein in favor of Denmark. The unity of Denmark, Schleswig, Holstein and Lauenburg was secured by a uniform law of succession, and as far as was practicable their internal affairs were placed under a common administration. The protocol was succeeded by the treaty of 1852, which historians call "its logical consequence." This treaty assigned the succession to the kingdom of Denmark and the duchies to Prince Christian of Glücksburg, and declared the integrity of the whole Danish monarchy to be permanent; but the rights of the German Confederation with regard to Holstein and Schleswig were "reserved." The declaration was made in accordance with the views of France, Russia and England; the reservation was inserted in the interest of the German powers. It was under this protocol and its succeeding treaty that Denmark expected the aid of England when, in 1864, Austria joined with Prussia to overthrow the treaty and seize Schleswig-Holstein. England called a conference of the signatory powers and attempted by peaceful means to put an end to the war. To quote a modern historian in 'The Historians' History of the World,' "English diplomacy had made every effort imaginable to save the London Protocol and the integrity of the Danish State; but the sole price at which Napoleon III conjointly with England would venture on the strife, the conquest of the left bank of the Rhine, seemed too high, and so it satisfied itself with inviting the subscribers of the protocol to a conference in London. The latter met for no other purpose than the rupture of the protocol, from which the German powers also detached themselves, and to confirm the overthrow of the Danish State, which at the close of the diplomatic tournament saw itself thrown on its own resources. The first notable encounter between British and German warships after the opening of the World War occurred off Heligoland on 28 Aug. 1914, when a small fleet of British battleships, cruisers and torpedo boats sank two German cruisers and two destroyers. In another engagement, off Heligoland Bight, on 24 Jan. 1915, five British cruisers, seven light cruisers and a destroyer flotilla fought four German armored cruisers, four smaller cruisers and two flotillas of torpedo boats for about four hours. The principal result was the sinking of the German cruiser *Bluecher*, when only 123 of its complement of 850 officers and men were saved. Pop. of province and Heligoland, 1,621,004. See DENMARK.

SCHLEY, slī, Winfield Scott, American naval officer: b. near Frederick, Md., 9 Oct.

1839; d. New York, 3 Oct. 1911. He was graduated at the United States Naval Academy in 1860 and went as midshipman on the *Niagara* to China and Japan. Returning in 1861, he was made master, served on the *Winona* in the West Gulf blockading squadron, later on the *Monongahela* and the *Richmond*, and participated in all the engagements which led to the capture of Port Hudson in 1863, having been promoted to the rank of lieutenant in 1862. Ordered from Southern waters in 1864 to the Pacific squadron, he served on the *Waterloo* as executive officer till 1866, when he was promoted lieutenant-commander. In this period he suppressed an insurrection of Chinese coolies on the Chincha Islands, and for protection of United States interests landed a body of men at San Salvador during a revolution. From 1866 to 1869 he was instructor at the Naval Academy; then, being assigned to the Asiatic station, served there on the *Benicia* for three years, earning distinction at the taking of the Korean forts on the Salween River in 1871. Again, in 1872, he was detailed as instructor at the Naval Academy, and in 1874 was made commander. After serving in Europe and on the west coast of Africa, he commanded the *Essex*, on the Brazil station, 1876-79. He was selected to command the third government relief expedition (1884) for the rescue of Lieut. A. W. Greely (q.v.), which he promptly accomplished. Having served (1885-89) as chief of the Bureau of Recruiting and Equipment, he was promoted captain in 1888. From 1889 to 1891 he was in the southern Pacific as commander of the cruiser *Baltimore*, and in the latter year interposed at Valparaíso, Chile, when American sailors were assaulted in the streets.

In 1895 he was placed in command of the *New York*; was chairman of the Lighthouse Board 1897-98; in February of the last-named year became commodore, and after the outbreak of the war with Spain was given command of the Flying Squadron. Sailing from Hampton Roads, 13 May 1898, he began the historic search for Cervera's Spanish fleet, discovered it and finally established a blockade of the harbor at Santiago de Cuba (see UNITED STATES—WAR WITH SPAIN), where, on 29 May, Cervera was found to be. Schley's squadron was united 1 June with the fleet under acting Rear-Admiral W. T. Sampson (q.v.) and the blockade was continued until 3 July, when the Spanish ships came out of the harbor and were destroyed by the American vessels, which, during the temporary absence of Sampson, were under the immediate command of Commodore Schley, on board the *Brooklyn*. In August 1898 Schley was raised to the rank of rear-admiral.

An unfortunate controversy arose between partisans of Schley and those of Sampson over their respective claims to the credit of this great victory. Of that discussion neither officer personally took public notice until after the appearance of a work by Edgar Stanton MacLay (q.v.), entitled 'History of the United States Navy,' in which the author referred to Commodore Schley as a "caitiff, poltroon and coward." The proofs of the book had been read and approved by various naval officers, among them Rear-Admiral Sampson; and on 22 July 1901 Schley applied to the Secretary of the Navy for a court of inquiry. This request

was granted 24 July. The court was convened 12 September and its sessions continued for one month. It consisted of Admiral Dewey, president, and Rear-Admirals Benham and Ramsey. The verdict, returned 14 Dec. 1901, was a disagreement, Admiral Dewey refusing to subscribe to censures on Schley's conduct which were made by the two other members. The "majority" report, signed by two members only, found Schley guilty of vacillation, lack of enterprise and disobedience, and in other particulars strongly criticised his conduct, both before and during the battle of Santiago de Cuba, while recognizing his personal courage in the action. Admiral Dewey, however, presented a "minority" report, in which he praised Schley for promptness and efficient service, and gave him the credit for the destruction of Cervera's fleet. Schley filed with the Secretary of the Navy objections to the "majority" report, but it was nevertheless approved by Secretary Long, 20 Dec. 1901. In January 1902, Rear-Admiral Schley appealed from the verdict to the President, who, however, confirmed Secretary Long's approval. On recommendation of the court, no action was taken upon its findings. Schley's retirement from active service at the age limit occurred 9 Oct. 1901. In collaboration with J. R. Soley (q.v.), he wrote 'The Rescue of Greely' (1886); he also wrote 'Forty-five Years under the Flag' (1904).

SCHLICH, shlik, Sir William, English forester: b. Darmstadt, 1840. He was educated at Darmstadt and the University of Giessen and was appointed in 1866 to the Indian forest department. He held the offices of conservator of forests, 1871, and inspector-general of forests, 1881; and organized the first school of forestry in England, at Cooper's Hill, in 1885. He was made F.R.S. in 1901 and knighted in 1909. He is the author of 'A Manual of Forestry' (5 vols., 1889-96); 'The Outlook of the World's Timber Supply'; 'Afforestation in Great Britain and Ireland'; 'Forestry in the United Kingdom.'

SCHLIEMANN, shlē'mān, Heinrich, German archaeologist: b. Neubuckow (Mecklenburg-Schwerin), 6 Jan. 1822; d. Naples, 27 Dec. 1890. He spent five years as a pupil in retail business in Fürstenberg, then embarked as cabin-boy on board a ship bound for Venezuela. The ship was wrecked on the coast of Texel, but Schliemann was saved and taken to Amsterdam. Here he obtained a post in a commercial house and set himself to acquire a thorough knowledge of the chief European languages. In 1846 he was sent to Saint Petersburg as agent for another Amsterdam firm. In 1850 he happened to be in California on 4 July when the State entered the Union and acquired American citizenship. By 1856 he had learned modern Greek and begun the study of ancient Greek, and in 1858-59 traveled in Sweden, Denmark, Germany, Italy, Egypt, Syria and Greece. Having amassed a considerable fortune in trade, he retired from it in 1864 in order to devote himself wholly to archaeological studies. He traveled round the world in 1864-66, and in 1868 went to the coast of Asia Minor by way of Corfu and the Morea. In 1870 he undertook at his own cost the excavation of the heaps of ruins at Hissarlik, in the Troad, which he believed to be the site of ancient Troy

(q.v.). These excavations he carried on with interruptions until 1890. Contrary to agreement with the Porte, he retained possession of all the spoils discovered there, and was compelled by the Greek courts to pay the sum of \$10,000. He presented his collections to the Museum für Völkerkunde at Berlin. In 1876 he began similar excavations at the site of ancient Mycenæ in Greece. Little confidence was at first placed in his methods by trained archæologists, and when his discoveries had been made their historical value was for a time doubted. But scholars now generally agree that they attest powers adequate to the Trojan War, and make the traditional account probable in its main outlines. Consult his autobiography edited by his wife (Leipzig 1891); Schuchardt, 'Schliemann's Excavations and Archæological and Historical Studies' (London 1891); Sandys, J. E., 'A History of Classical Scholarship' (Cambridge 1908); Hawes, C. H. and H., 'Crete: the Forerunner of Greece' (London 1909).

SCHLOSSER, shlös'sër, **Friedrich Christoph**, German historian: b. Jever, Oldenburg, 18 Nov. 1776; d. Heidelberg, 23 Sept. 1861. He studied at the University of Göttingen 1794-98, and published his first history, 'Geschichte der bildersturmenden Kaiser des Oström' in 1812. He was professor in the Lyceum of Frankfurt 1812-14 and city librarian until 1819, when he was called to Heidelberg as professor of history at the university, a position retained until his death. Schlosser's writings, which are characterized by a great love of truth and a high moral tone in judgment, include 'Weltgeschichte in zusammenhängender Erzählung' (1817-24); 'Geschichte des 18. Jahrhunderts' (1823); 'Universal-historische Uebersicht der Geschichte der alten Welt und ihre Kultur' (1824-34).

SCHLUNDT, shlünt, **Herman**, American chemist: b. Two Rivers, Wis., 19 July 1869. He was graduated at the University of Wisconsin in 1894 and took his Ph.D. at the University of Leipzig in 1901. He was for a time connected with the faculty at the University of Wisconsin, and from 1902 was associated with that of the University of Missouri, where he was professor of physical chemistry in 1907-13, and chairman of the department of chemistry in 1910-15. He is author of numerous articles on physical chemistry and radio-activity and of 'Laboratory Experiments in General Chemistry' (1912).

SCHLUTER, shloo'tër, **Andreas**, German sculptor and architect: b. Hamburg, 20 May 1664; d. Saint Petersburg, 1714. His father was a sculptor and brought him in early life to Dantzic. He left that place for Marschau, where he opened a studio as a sculptor and eventually (1694) settled in Berlin. The Baroco style of architecture, then popular in Holland, attracted his fancy and in this style he began (1696) to make designs for rebuilding the royal residences. Before carrying them out he took a journey through Italy, where he built the central front of the castle at Charlottenburg, and subsequently began the restoration of the royal castle at Berlin and became actively engaged in designing buildings of this class in other parts of the country. He eventually removed to Saint Petersburg and became court architect to Frederick the Great. Among the

statues he erected in Berlin are the statue of the grand elector (cast by Jacobi in 1700). Besides the bronze statue of the Grand Elector Frederick III at Königsberg, the tomb of Frederick I and his wife in Berlin and the marble screen in the church of Saint Mary, he produced numerous designs for the gorgeous interior decoration of the Goldsmiths' Hall, Berlin, and other buildings. Consult Adler, 'Andreas Schlüters Leben.'

SCHMALKALDEN, shmäl'käl'dën, **Articles of**, a Protestant confession which was drawn up at the instance of John Frederick, Elector of Saxony, by Luther and other divines, and signed at Schmalkalden in February 1537. These articles were essentially the same as those of the Confession of Augsburg, but in much stronger language. See REFORMATION, THE.

SCHMALKALDIC LEAGUE, the league formed at the close of 1530 by the Protestant princes of Germany, assembled at Schmalkalden, to resist the aggressive measures contemplated by the Emperor Charles V. It ultimately included the whole of northern Germany, Saxony, Würtemberg and Denmark, with portions of Bavaria and Switzerland. The object of the league was the common defense of the political and religious freedom of the Protestants, and the confederacy was first intended to continue only for six years, but subsequent events induced them in 1535 to renew it for another period of 10 years, and to raise a permanent army to carry out the objects of the league. About this time it was joined, among others, by the king of France, Francis I, though only from political motives, and Henry VIII of England declared himself its protector. The confederacy received a fuller consolidation by a new Protestant confession, drawn up at the instance of John Frederick of Saxony by Luther and other divines, and known as the Articles of Schmalkalden, from the circumstance of their having been signed (1537), like the league itself, at the town of Schmalkalden. These articles were essentially the same as those of the Confession of Augsburg. The league was latterly crippled by mutual jealousy and the conflict of interests, and its early successes in the so-called Schmalkalden War were ultimately more than outweighed by the complete rout at Mühlberg and the capture of John Frederick. The ends of the league, however, were ultimately gained through the instrumentality of Duke Maurice, now Elector of Saxony, who in 1552 declared war against the emperor, and forced him in 1552 to grant the Treaty of Passau, which secured the religious liberty of the Protestants. See also CHARLES V; REFORMATION, THE.

SCHMAUK, smäk, **Theodore Emmanuel**, American Lutheran clergyman: b. Lancaster, Pa., 1860. He was graduated at the University of Pennsylvania in 1880, ordained to the Evangelical Southern ministry in 1883; was editor-in-chief of the *Lutheran Church Review* from 1895; literary editor of the *Lutheran* from 1889; professor of Christian faith in the Lutheran Theological Seminary from 1911 and president of the General Council of Evangelical Lutheran Churches in North America from 1903. He published 'The Negative Criticism of the Old Testament' (1894); 'History of Old Salem and Lebanon' (1898); 'The Early

Churches of the Lebanon Valley' (1902); 'The History of the Lutheran Church' (1903); 'The Christian Kindergarten' (1906); 'The Confessions and Confessional Principle of the Lutheran Church' (1909); 'Christianity and Christian Union' (1913), etc.

SCHMID, shmīt, Matthias, Austrian painter: b. See, Tyrol, 14 Nov. 1835. He studied at the Munich Academy (1856) under Schrandolph, and was a pupil of Piloty (1869), when the persecution to which the clergy subjected him on account of his liberal views caused him to leave Tyrol. He won the Vienna medal in 1873. Among his canvases are 'The Entombment'; 'The Flight into Egypt'; 'The Judge of Morals' (1873); 'Festival of the Parson's Cook' (1874); 'The Betrothal' (1879); 'Repairing the Damage' (1882); 'Blind Man's Buff' (1884); 'Forsaken' (1885); 'In the Picture Gallery' (1886). He has also done in fresco at the Innsbruck Cemetery 'The Three Marys at Christ's Tomb' (1859).

SCHMID, Ulrich, German historian: b. Niederrieden, Swabia, 4 July 1876. He was educated at the Memmingen Latin School and the Würzburg Gymnasium, the universities of Würzburg, Freiburg-in-Breisgau, Munich and Vienna. He has devoted much of his time to the study of the history of culture and since 1904 has edited *Walthalla* at Munich. He has published 'Saint Ulrich, Bischof von Augsburg' (1901); 'Traditionen an die Kirche Saint Veit am Gölsen' (1904); 'Kirchen- und profanhistorische Mitteilungen aus italienischen Archiven und Bibliotheken' (1905); 'Das deutsche Volkslied' (1905); 'Johann Geyler a Kaisersberg' (1906); 'Das Chorgestühl in der Saint Martinskirche zu Memmingen' (1906); 'Agnes die Bernauerin und Herzog Albrecht III der Gütige' (1906); 'Die Schlacht bei Hoflach-Alling und ihr Denkmal' (1906); 'Tagebuch des Pfarrers Michael Gotzmann' (1907); 'Otto von Lonsdorf, seine Herkunft und Reformen im Passauer Hochstift' (1909); 'Karl Haider, ein deutscher maler' (1910); 'Albin Egger-Lienz' (1910); 'Reisebilder Bamberg-Würzburg' (1910); 'Italienische Reisebilder' (1911); 'Das katholische Kirchenjahr in Wort und Bild' (1912). He edited 'Das katholische Kirchenjahr in Bildern' (1910), and the religious art series of *Glaube und Kunst* since 1912.

SCHMIDT, shmīt, Johannes, German philologist: b. Prenzlau, 29 July 1843; d. Berlin, 4 July 1901. After study at the University of Bonn he was there made professor (1873), in the same year removed to Grätz, and from 1876 until his death was at Berlin. In 1884 he was elected to the Prussian Academy of Sciences. Probably he was not excelled by any scholar of his time in an extensive scientific knowledge of the grammar of the Indo-European group of languages. From 1875 he edited (with Kuhn) the 'Zeitschrift für vergleichende Sprachforschung'. Among his more important works are 'Zur Geschichte des indogermanischen Vokalismus' (1871-75); 'Die Verwandtschaftsverhältnisse der indogermanischen Sprachen' (1872); 'Die Pluralbildungen der indogermanischen Neutra' (1889), and 'Kritik der Sonantentheorie' (1895).

SCHMIDT, Johann Kaspar, German philosopher (1806-56), better known under his pseudonym of MAX STIRNER (q.v.).

SCHMIDT, Nathaniel, American Orientalist: b. Hudiksvall, Sweden, 22 May 1862. He was educated at the universities of Stockholm, Colgate and Berlin. He became professor of Semitic languages and literature at Colgate University in 1888 and since 1896 holds the same chair in Cornell University. In 1904-05 he was director of the American School for Oriental Study and Research in Jerusalem. He was president of the Society for Biblical Literature and Exegesis in 1914. Among his publications are 'Introduction to the Hexateuch' (1896); 'Biblical Criticism and Theological Belief' (1897); 'The Republic of Man' (1899); outline histories of Egypt, India, Babylonia and Assyria, Syria and Arabia (1901-04); 'The Prophet of Nazareth' (2d ed., 1907); 'The Original Language of the Parables of Enoch' (1908); 'The Messages of the Poets' (1911). He has written a number of articles on the books of the Old Testament for THE ENCYCLOPEDIA AMERICANA, and has also contributed largely to other encyclopedias and to theological publications.

SCHMITZ, Eugene F., American politician: b. San Francisco, 19th century. He was elected mayor of San Francisco on the Union Labor ticket in 1900 and was twice re-elected. In 1907 he, with Abe Ruef (q.v.), was tried on a charge of extortion in connection with the sensational graft scandals then uncovered. He was convicted, but succeeded in having the judgment set aside. Later he again became active politically and he was his party's candidate for mayor in 1915, but was not elected.

SCHMUCKER, shmük'ēr, or **SMUCKER**, Samuel Mosheim, American historical writer: b. New Market, Va., 12 Jan. 1813; d. Philadelphia, Pa., 12 May 1863. He was graduated at Washington College, Pennsylvania, in 1840, and was licensed to preach in the Lutheran Church. In 1848 he resigned his duties as a pastor to study law, was admitted to the bar and practised for a time in Philadelphia; but after 1855 devoted himself almost wholly to literature. Author of 'Errors of Modern Infidelity' (1848); 'Court and Reign of Catherine II, Empress of Russia' (1855); 'Life of John C. Fremont' (1856); 'Life of Alexander Hamilton' (1856); 'Life of Thomas Jefferson' (1857); 'Arctic Explorations and Discoveries' (1857); 'Life of Dr. Elisha Kane and Other American Discoverers' (1858); 'History of Modern Jews' (1860); 'Life of Daniel Webster' (1859), etc. At his death he had completed one volume of his 'History of the Civil War in the United States' (1863).

SCHMUCKER, Samuel Simon, American Lutheran clergyman and educator: b. Hagerstown, Md., 28 Feb. 1799; d. Gettysburg, Pa., 26 July 1873. He was educated at the University of Pennsylvania and at Princeton Seminary and was ordained in the Lutheran Church in 1821. He served as pastor in 1821-26 and 1826-64 he was chairman of the faculty of the Theological Seminary at Gettysburg, Pa. He was instrumental in securing a connection between the Lutheran churches in America and Europe. He was a voluminous writer. Author of 'Ele-

ments of Popular Theology' (1834); 'Fraternal Appeal to the American Churches on Christian Union' (1838); 'Lutheran Manual' (1855); 'Evangelical Lutheran Catechism' (1859); 'Unity of Christ's Church' (1870), etc.

SCHNEIDER, shnī'dér, **Charles Conrad**, American engineer: b. Apolda, Saxony, 24 April 1843; d. 8 Jan. 1916. He was graduated at the Royal Technical School, Chemnitz, Germany, in 1864, came to the United States in 1897 and engaged in locomotive and bridge construction. He was vice-president of the American Bridge Company in 1900-03 and in 1911 became a member of the board of engineers for the Quebec bridge. Among the many bridges he designed and built are the cantilever Fraser River bridge on the Canadian Pacific Railway, and the Niagara cantilever bridge. In 1905 he was president of the American Society of Civil Engineers. Author of 'General Specifications for Railroad Bridges' (1886); 'General Specifications for Highway Bridges' (1901); 'General Specifications for Structural Steel Work in Buildings' (1905; new ed., 1910).

SCHNEIDER PROCESS OF ARMOR PLATE. See ARMOR PLATE.

SCHNITZER, shnīt'sēr, **Edward**. See EMIN PASHA.

SCHNITZLER, Arthur, Austrian dramatist and novelist: b. Vienna, 15 May 1862 (the son of the well-known laryngologist, Professor Johann Schnitzler, 1835-93); still living at Vienna. He studied medicine at the University of Vienna, receiving his degree in 1885, was interne in the Vienna General Hospital from 1886 to 1888, and then became an assistant at the Vienna Polyclinic as well as a private general practitioner. In judging the general tone, style and choice of subject of the Viennese writers of Schnitzler's generation it is important to remember that they differ from their Berlin contemporaries in that the former are more affiliated, in the emulation of their models, with French and Italian writers, while the latter incline more to an imitation of the Russians and Scandinavians. This means greater perfection of form and style among the Viennese, greater depth of treatment and recognition of the social milieu among the Berliners. Schnitzler and Gerhart Hauptmann may well be regarded as typical representatives of their respective cities in the same generation. 'Anatol' (Berlin 1892), Schnitzler's first publication, is typical of almost all his later work. It is a series of seven dramatic scenes, each depicting, in delicate psychological treatment, a different phase in the rather frivolous love-life of the hero. 'Liebeleí' (1896) is a drama depicting love in a more tragic aspect. 'Der grüne Kakadu' (1899), was played by Mrs. Fiske in New York as 'The Green Cockatoo,' as a "curtain-raiser" to Hauptmann's 'Hannele'; it is a one-act play of powerful dramatic construction, dealing with a superficial episode of the French Revolution. His later plays become more mystical and resigned in tendency, although the erotic undercurrent is absent only in one play ('Professor Bernhardt,' see below): 'Paracelsus' (1899), 'Der Schleier der Beatrice' (1901), 'Lebendige Stunden' (1902), 'Der einsame Weg' (1903), 'Der Ruf des Lebens' (1905), 'Comtesse Mizzi' (1909),

'Der junge Medardus' (1910), 'Das weite Land' (1911). 'Professor Bernhardt' (1913) is a serious comedy, a satirical presentation of Austrian political intrigue, in which great issues are made to depend on trifling happenings. Only one female character appears in the play, a hospital nurse, who drops from view as soon as she has started the mischief. The treatment of anti-Semitic tendencies in ousting a Jewish hospital-director from his position because he has come into conflict with the interests of the ruling church receives added interest from the fact that Schnitzler is himself by birth a Jew and by training a physician, and it is not unlikely that the subject may be taken from one of his own experiences. In 1915 Schnitzler published 'Komödie der Worte,' three one-act plays, in which he shows, by again resorting to erotic subjects, that the war in Europe has not always been successful in turning men's minds to serious topics. In one of the plays ('Die Stunde des Erkennens') a physician who has been married for 22 years orders his wife to leave the house for a marital infidelity committed 10 years before. This is a theme occurring again and again, especially in his short stories, which must not be overlooked, as their artistic value is perhaps even higher than that of his plays. Among the best short stories are 'Sterben' (1895), 'Die Frau des Weisen' (1898), 'Leutnant Gustl' (1901), 'Die griechische Tänzerin' (1904), 'Der Tod des Junggesellen.' There are also two longer narratives (the second a long novel): 'Frau Bertha Garlan' (1901), 'Der Weg ins Freie' (1908). Schnitzler's collected dramas have appeared at Berlin (1910, 4 vols.), as well as the collected narratives (1910, 3 vols.). (See ANATOL). A translation of the one-act play 'Literature' will be found in 'The German Classics of the 19th and 20th Centuries' (New York 1914), and a number of other plays have been translated by Edwin Björkman. Consult Hartmann, J. W., 'Schnitzler's Vienna' (*The New Review*, New York, January 1916); Pollard, Percival, 'Masks and Minstrels of New Germany' (Boston 1911); Salkind, Alexander, 'Arthur Schnitzler' (Leipzig 1907); Ratislaw, J. K., 'Arthur Schnitzler' (Hamburg 1911); Kapp, Julius, 'Arthur Schnitzler' (Leipzig 1912).

JACOB WITTMER HARTMANN,
The College of the City of New York.

SCHNÖRR VON KAROLSFELD, shnör fön kär-öls-fält, **Julius**, German painter: b. Leipzig, 26 March 1794; d. Dresden, 24 May 1872. His father was a painter and initiated him into the rudiments of art. In 1811 he proceeded to Vienna, and while there produced several works. In 1817 he visited Italy, spent a year at Florence and then took up his residence at Rome. Here he attached himself to the "Nazarenes," then under the leadership of Cornelius and Overbeck. His painting 'The Wedding in Cana' attracted so much notice that he was chosen, along with the two painters already named, to paint the walls of the Villa Massimi at Rome. Among other works produced by him at Rome are 'Jacob and Rachel'; 'Ruth and Boaz'; 'The Flight into Egypt,' and 'Children brought to Jesus.' He removed to Munich in 1827, and was appointed professor of historical painting in the Academy of

Fine Arts there. He was next commissioned to decorate the new palace with frescoes of scenes from the national poem of the 'Nibelungenlied'; and adorn the Festsaalbau with incidents in the lives of Charlemagne, Frederick Barbarossa and Rudolf of Hapsburg. These are perhaps the most popular of modern works in fresco in Munich. In 1846 he became director of the picture gallery and professor at the Academy of Fine Arts in Dresden. While here he completed his illustrations of the Bible, 'Die Bibel in Bildern' (1852-60). They exhibit wonderful animation, variety and power. To the Dresden period also belong the oil-painting of 'Luther at the Diet of Worms,' and the designs for a window for Saint Paul's, London, representing scenes from the life of Saint Paul.

SCHODDE, George Henry, American scholar: b. Allegheny, Pa., 15 April 1854; d. 15 Sept. 1917. He was graduated from Capital University 1872 and from Leipzig University 1877, was professor of Greek and theology at Capital University, Columbus, Ohio, from 1880, editor of *The Lutheran Standard* from 1880 and of *The Theological Magazine* from 1897. He was also a contributor to the *Independent*, the *Sunday School Times* and a large list of church periodicals. He published 'The Protestant Church in Germany' (1903); and translated 'The Book of Enoch' and 'The Book of Jubilees,' from the Ethiopic, and 'Day in Capernaum' from the German of Delitzsch, Weiss' 'Religion of the New Testament' (1905). Weiss' 'Commentary on the New Testament' (4 vols. 1906), etc.

SCHOEBOEN, shé'börn, August, American architect: b. Germany, about 1827; d. Washington, D. C., 25 Jan. 1902. He came to Wisconsin in 1849, but later removed to Washington, D. C., where until his death he was a member of the staff of the architect of the Capitol. In Civil War time he drafted plans of barracks, hospitals and forts for the quartermaster-general's department, and maps and plans for the use of General McDowell.

SCHOEFFER, shéf'fēr, Peter, German printer: b. Gernsheim, near Mainz, about 1430; d. about 1502. At about the age of 20 he was a student at the University of Paris, and a copyist. It seems likely that Gutenberg taught him what he knew of printing and employed him in his establishment at Mainz. After Fust and Gutenberg dissolved partnership Schoeffer was connected with the former, and the two names are associated on the imprint of the 'Book of Psalms,' printed in 1457. The reputation of his being the inventor of matrices and the typemold got abroad during his lifetime and was aided by his own artful insinuations; but modern research has disproved his claim to the work done by Gutenberg. He followed the career of printer after the death of his partner, Fust, and issued many works alone. He was succeeded by three sons who became eminent printers. Consult De Vinne, 'The Invention of Printing' (1876).

SCHOENECK, shén'ek, Edward, American lawyer: b. Syracuse, N. Y., 1 Aug. 1875. He studied law at Syracuse University and was admitted to the bar in 1903. In 1902 he became a member of the board of supervisors of Onondaga County, was a member of the

New York assembly, 1904-07 and mayor of Syracuse, 1910-13. He was elected lieutenant-governor of New York State 1915-16.

SCHOENFELD, schén'fēlt, Hermann, professor and author: b. Oppeln, Germany, 21 Jan. 1861. He was educated in the universities of Berlin, Breslau and Leipzig, and in 1888 accepted a call as instructor in modern languages at Providence, R. I., and later at New Bedford, Mass. In 1891 he was appointed to Johns Hopkins University; in 1893 sent by President Cleveland as consul at Riga, Russia, and delegated by the United States Bureau of Education to investigate higher education in Russian, Austrian and Prussian Poland. Since October 1894 he has been professor of Germanics at Columbia (now George Washington) University. Dr. Schoenfeld is a contributor to many German and American magazines and encyclopedias, including *THE ENCYCLOPEDIA AMERICANA*. He has published 'Brant and Erasmus' (1892); 'Erasmus and Rabelias' (1893); 'Higher Education in Poland' (1896); 'German Historical Prose' (1896); 'Leopold von Ranke' (1899); 'Treitschke'; he edited Schiller's 'Maria Stuart' (1899) and 'Wilhelm Tell' (1902); Bismarck's 'Orations and Letters' (1905); 'History of Teutonic Women, and Slavic Women' (1906); 'Essays on Universal Peace and German Armaments' (1913); 'Causes of the European Conflagration' (1914-15). Since 1914 he has also contributed extensively to journalistic literature on contemporaneous European history, especially of the Slavs and the Near East.

SCHOENLEBER, shén'lā-bēr, Gustav, German painter: b. Bietigheim, Württemberg, 3 Dec. 1851. He studied under Kurtz in Stuttgart and Adolf Lier in Munich, and traveled in Italy and Holland, in the latter country especially finding congenial themes for his landscape art. He reproduced the tender tints of the flat, moist land with now and then a church steeple or a clump of trees as a diversifying feature. In 1880 he was made professor at Karlsruhe. Among his works are 'Harbor of Genoa' at Rotterdam; 'Venetian Fishing Boats' at Hamburg Gallery; 'View of Flushing at Low Tide' (1881), Dresden Museum; 'Evening near Dordrecht,' Stuttgart Museum.

SCHOENN, shén, Aloys, Austrian artist: b. Vienna, 11 March 1826; d. Krumpendorf, 16 Sept. 1897. He studied at the Vienna Academy under Führich and Leander Russ. He served through the Italian campaign of 1848 and fought in the Hungarian war. During 1850-51 he studied at Paris, and then traveled in the East. His field is genre. Some of his works are 'Evening on the Nile'; 'Departure of Tyrolean Students from Vienna in 1848'; 'Storming of Ladrone,' 'On the Coast of Genoa,' 'Goose Market at Cracow,' at Vienna; 'Scene in Persecution of Jews'; 'Festival in Capri'; 'Fish Market at Chioggia'; 'Market in Bosnia'; 'Market in Tunis.'

SCHOFIELD, skō'fēld, John McAllister, American military officer: b. Gerry, N. Y., 29 Sept. 1831; d. Saint Augustine, Fla., 4 March 1906. He was graduated from West Point in 1853, and assigned to garrison duty in South Carolina and Florida. In 1855-60 he was assistant professor of philosophy at West Point, and was professor of physics in Washington

University, Saint Louis, Mo., in 1860-61. He acted as mustering officer for the State of Missouri at the outbreak of the Civil War, served on the staff of General Lyon in the Missouri campaign and in November 1861 was appointed brigadier-general of volunteers. He was in command of the District of Missouri in 1861-62, of a division in the Army of the Cumberland in 1863, and again commanded the Department of Missouri in 1863-64. In 1864-65 he commanded the Department of the Ohio, was engaged in the Atlanta campaign and commanded at the battle of Franklin, Tenn., in 1864, receiving rank as brigadier-general and brevet major-general in the regular army in recognition of his services. He continued in the army after the war, was Secretary of War in 1868-69, and commanded various departments until 1888 when he was assigned to the command of the army of the United States as senior major-general. In 1895 he was promoted lieutenant-general, a grade created for him, and later in the same year he was retired. He published 'Forty-six Years in the Army' (1897).

SCHOFIELD, Walter Elmer, American artist: b. Philadelphia, Pa., 9 Sept. 1867. He studied at the Academy of Fine Arts, Philadelphia, and in Paris under Bougereau, Aman Edmond Jean, Ferrier and Doucet. During a three years' residence at Saint Ives he specialized independently in landscape work and notable examples are 'Morning' and 'Midwinter Thaw' in the Cincinnati Museum, 'Across the River' in the Carnegie Institute, Pittsburgh, 'Morning after Snow' in the Corcoran Art Gallery, Washington, and 'Sand Dunes near Lelant' in the Metropolitan Museum, New York. He received several medals and honor awards and was elected National Academician in 1907. In 1915 he enlisted in the British army; received advancement to captain of artillery and saw active service in France.

SCHOFIELD, William Henry, American educator: b. Brockville, Ontario, 6 April 1870. He was graduated at the University of Toronto in 1889, and took his Ph.D. at Harvard in 1895, studying at Paris, Christiania and Copenhagen in 1895-97. He was master of modern languages at Collegiate Institute, Hamilton, Ontario, in 1889-92. From 1897 he was connected with the faculty at Harvard, and from 1906 he was professor and head of the department of comparative literature there. He was Harvard exchange professor at Berlin in 1907-08; and was lecturer at the Sorbonne, Paris, and at the University of Copenhagen in 1911. He was editor-in-chief of 'Harvard Studies in Comparative Literature.' Author of 'Studies on the Libeaus Desconus' (1895); 'The Home of Eddic Poems' (1899); 'English Literature from the Norman Conquest to Chaucer' (1905); 'Chivalry in English Literature' (1912); 'A Blind Bard from Faery' (1918) 'Life of William Wallace' (1918), etc.

SCHOHARIE, N. Y., town and village, county-seat of Schoharie County, on Schoharie Creek, and on the Middleburg and Schoharie and the Schoharie Valley railroads, about 28 miles west of Albany and 20 miles southwest of Schenectady. It is in an agricultural region, and in the vicinity are valuable stone quarries. It has a high school, graded elementary schools

and a school library. Pop. town, 2,526; village, 996.

SCHOHARIE GRIT, a more or less silicious and calcareous shale, or a silicious limestone typically found in the Schoharie Valley of eastern New York, from which it takes its name. It is intimately associated with the overlying Onondaga limestone of New York, with which together it forms the Ulsterian subgroup of the Mid-Devonic group. At its type location it is not over six feet thick and richly fossiliferous. In the Hudson Valley it is a shale, almost barren and sometimes 100 feet or more in thickness. See DEVONIAN; OLD RED SANDSTONE.

SCHOLAR-GIPSY, The, and THYRSIS. Matthew Arnold's pastoral idyls, 'The Scholar-Gipsy' (1853) and 'Thyrsis' (1866) are linked by internal references and, like 'L'Allegro' and 'Il Penseroso' by similarities of form, mood, scene and theme, both being interpretations of the sentiment of the Cumner country near Oxford as felt by a poetic spirit somewhat ill at ease amid the distractions of his century. The earlier poem was suggested by an incident related in Glanvil's 'Vanity of Dogmatizing' (1661) of an Oxford lad who had joined a band of gypsies and had acquired from them a secret for working wonders through the power of imagination. Arnold makes this lad a symbol of the simple-hearted idealism of an elder day, and feigns that his shy spirit still haunts the Cumner hills and appears to shepherds and reapers and village maidens dancing around the Fyfield elm in May—his hands filled with "dark bluebells drench'd with dew of summer eves." Apostrophizing this charming genius loci, the poet bids him shun the feverish contact of men infected with "this strange disease of modern life, with its sick hurry, its divided aims, its heads o'ertax'd, its palsied hearts." 'Thyrsis,' the only rival in English to 'Lycidas' and 'Adonais,' was written ostensibly to commemorate the author's friend, Arthur Hugh Clough, who had died at Florence in 1861; but there is not very much of Clough in the piece. What Arnold really commemorates is the emotion excited by the pastoral loveliness of the scenes in which he and his brother poet, a companion of his college days, spent their dreaming youth, as yet untroubled by the contentions of the workaday world, still pursuing the gleam of a poetic imagination, still free to wander like Sicilian shepherds through "many a dingle on the loved hillside." With one exquisite image after another Arnold evokes the feeling of early spring, the fragrance of whitening hedges, the cuckoo's parting cry, the rapture of young blood in June when the high midsummer pomps come on:

"Roses that down the valleys shine afar,
And open jasmine-muffled lattices,
And groups under the dreaming garden-trees
And the full moon, and the white evening-star."

Death and the call of the busy world ended this Theocritean holiday and harshened and silenced the music of these young singers, but by the magic of these two poems Arnold and Clough and the nameless Oxford lad will be associated forever, in the minds of all lovers of poetry, with the romance of the "home of lost causes" and the enchantment of the Eng-

lish spring. For periodical criticisms consult Smart, T. B., 'Bibliography of Matthew Arnold' (1892); books on Arnold by Saintsbury, George (1899); Paul, H. D. (1902); Russell, G. W. E. (1904); Dawson, W. H. (1904); Dixon, J. M. (1906); Sherman, S. P. (1917).

STUART P. SHERMAN.

SCHOLASTICISM (Lat. *schola*, "school"). Scholasticism is the philosophy of the "Schools." Charlemagne (742-814), inviting leading scholars of the Church to his court, established a Palatine School and a series of cloister and diocesan schools throughout his empire, and out of these as the mediæval centres of learning arose the scholastic philosophy. The term "scholastic" (Doctor Scholasticus) was applied not only to teachers of the seven liberal arts in these Carolingian institutions and the later established seats of learning, but also to teachers of theology and philosophy. The term gradually became narrowed to denote the latter class. The movement extends from 850 to 1453 A.D. and may be divided into two periods: (1) 850-1200, that is, from Johannes Scotus (or Erigena) to John of Salisbury and the Arabs; (2) 1200-1453, that is, from Alexander of Hales to the fall of Constantinople and the rise of Humanism. The first period is characterized by the controversy on the subject of universals. The second period is marked by the fusion of Aristotelianism with dogmatic theology, the delimitation of the spheres of faith and reason and the controversy regarding the primacy of the will over the intellect. In the first period the chief figures are Johannes Scotus, also called Erigena (that is, Irish-born, b. 810, d. 877, the earliest notable scholastic, fused Neo-Platonism with Christian theology, Gerbert (c. 1003 as Pope Sylvester II and distinguished for investigations in mathematics and natural science), Roscellinus (b. 1050, originator of Nominalism), Peter Lombard (d. 1164 as bishop of Paris, writer of the famous 'Sentences'), William of Champeaux (1070-1121, champion of realism against Abelard), Anselm of Canterbury (1013-1109, constructed an ontological argument for the existence of God), Abelard (1079-1142, originator of Conceptualism), John of Salisbury (1110-80, beginnings of reactionary attitude toward the one-sided scholastic culture). To the second period belong chiefly the following: Alexander of Hales (d. 1245, one of the originators of the 'Summa,' a sort of encyclopedia of theology and natural science, that attained vogue in this period), Bonaventura (1221-74, mystic), Albertus Magnus (Count of Bollstädt, 1193-1280, the most learned man of his age in the natural sciences), Thomas Aquinas (1225-74, fused Aristotelianism with Christian theology), Duns Scotus (1274-1308, advocate of the primacy of the will against the Determinism of the Thomists), William of Occam (1270-1347, important Nominalist and opponent of the temporal power of the papacy). The early schoolmen possessed among other works a meagre part of the logical treatises of Aristotle, Plato's *Timæus*, the writings of Boethius, Cicero, Seneca, Augustine, Martianus Capella and Pseudo-Dionysius the Areopagite. The latter schoolmen possessed the whole body of Aristotelian writings, and the works of the Arabs and Jews. One of the fundamental characteristics of the scholastic

period is the subservience of philosophy to theology. Philosophy is under the rigid censorship of the Church and although the intrinsic spirit of scholastic philosophy may not be that of a "handmaid to theology" (*ancilla theologiæ*), yet ecclesiastical authority reduces it practically to that position. Its real spirit is no doubt the desire to harmonize rational and revealed truth, and not to diminish the claims of reason. Nevertheless, its historical function was not so much the discovery of truth, as the defense of dogma. The service demanded of philosophy is apologetic and, therefore, the discipline of logic is particularly important and widely studied. Knowledge is subordinated to faith. In the scholastic era the Church was the bearer both of science and religion, but as the interests of the latter were the primary concern of the Church and in its estimation the most important for man, the subordination of science to theology was, from the Church's viewpoint, both legitimate and necessary. Gradually, however, science and philosophy asserted their independent claims, and in the Renaissance, the rebirth of the Greek spirit and of the dignity and worth of profane culture,—reason assumed a distinctive position for itself. The result was a long warfare between science and theology, between reason and creed. Although scholasticism was a combination of Hellenic thought with the Church dogmas, yet the rationalistic spirit of Greek philosophy remained practically dormant during the entire scholastic period and did not really awake until the rise of Humanism. The most important question for early scholasticism was the ontological significance of logical genera or universals. In this controversy the scholastics split into two great parties, the realists and nominalists.

Realism is the doctrine that genera and species have existential reality, that is, they are entities, and extreme realists regarded such universals as existing apart from and independent of particulars. The formula for the extreme realists is that universals exist *ante rem* ("before the particular," Platonism); of the moderate realists that they exist *in re* ("in the particular," Aristotelianism). The extreme opposition was formed by the nominalists who maintained that universals or genera are only class names and have no existence apart from the name. A middle party was formed by the conceptualists or sermonists, who maintained that universals are concepts and have ideal existence as notions in the mind, or, as Abelard more specifically held, the word becomes universal by means of predication. The formula for nominalism and conceptualism is that universals exist *post rem* (after the particular). These discussions of the Middle Ages were powerless to advance knowledge, being mainly exercises in abstract dialectic, although carried on with great subtlety and genius in logical analysis. The question acquired, however, an important bearing by involving the doctrine of the Trinity and the existence of God. According to the realists the greater the universality, the greater the reality; the wider the concept the more extensive its being. God, as the most universal notion, has the most complete reality; as *ens generalissimum* He is *ens realissimum*. Further, the nominalists regarded as real only the individual, concrete thing. The realists urged against this that according to nominalism,

only the three persons (as individuals) of the Trinity have reality; therefore, there is no Godhead and we have Tritheism. For this consequence of nominalism Roscellinus was condemned at the Council of Soissons (1092). It was also maintained that if realism is not true, then such universal ideas as Humanity, the Church and Original Sin refer to no real existence. Anselm, "last of the Fathers," maintained that the universals existed before particular things in the mind of God. The most memorable controversy on the subject took place in Paris between William of Champeaux and Abelard, in which the latter gained a dialectic victory. Scholasticism reached its complete formulation in Thomas of Aquino ("Angel of the Schools"). Thomas developed a system of philosophy by the fusion of Aristotelianism with Christian theology and Thomism remains to the present time the most generally accepted system of Christian philosophy in the Roman Catholic Church. Thomas sought to correlate more precisely than his predecessors the spheres of faith and reason. Reality and truth are one continuous realm, although certain truths transcend reason and are apprehended only by faith. Truths that belong to the mysteries of faith are the doctrines of original sin, the creation of the world in time, the incarnation and resurrection of Christ, the Trinity and the final judgment. These are not demonstrable by human reason, but are matters of revelation and are assented to by faith. Faith and revelation do not contradict reason; they transcend it. Faith and reason together apprehend the continuous and harmonious reality of the supernatural and natural. It is not possible, according to Thomas, that what is true for faith may be false for reason. Yet many scholastics took refuge in the doctrine of a "twofold truth," asserting that what is true for reason may not hold good in theology. An absorbing question for the late scholastics was the psychological question whether primacy belongs to the will or to the intellect. Does the will determine our ideas, or do our ideas determine the will?—a question that was bound up by the scholastics with the will's freedom. Thomas is Determinist; Scotus is Voluntarist. It is the will or the intellect decisive for character? On the side of the primacy of the intellect (cf. the Socratic theory that virtue is knowledge) were ranged Thomas Aquinas, the mediæval Aristotelians, the German mystics and the Dominicans; on the side of the will Duns Scotus, the Augustinians, William of Occam and the Franciscans. On the question of universals Thomas and Scotus took similar ground, namely, that of moderate realism. Both maintained that the universals exist in the mind of God (*ante rem*) as ideas before creation, substantially and immanently in things (*in re*), and as notions and names employed by the individual mind (*post rem*). The revival of nominalism in William of Occam marks the growing interest in the world of particular, concrete things, as the only real things. The renewal of nominalism was symptomatic of the condition of the age, of a growing interest in empiricism; it stood for the reform tendency, and although in the 14th and 15th centuries it grappled with realism in a final struggle and was vanquished in the Church, it found outside a powerful ally in secular science in whose triumph it shared.

The philosophy of the Arabs during the scho-

lastic era is essentially Aristotelianism combined with elements of Neo-Platonism (the emanation theory). Their interest was mainly in medicine, natural science and mathematics. The chief Arabic philosophers are Alfarabi (d. 950), Avicenna (980–1037), Algazel (1059–1111), and Averroës (1126–98), and they were important as the carriers of Aristotelianism and the seeds of natural science into Europe through Spain. The Jewish philosophy of the scholastic period is partly the Cabbala (a secret emanistic philosophy recorded in the works of Jezirah and Sohar) and Aristotelianism. The most important figure is that of Moses Maimonides (lived in Cordova and Cairo 1135–1204), who combined the sublunary philosophy of Aristotle with Hebrew theology.

The great and serious effort of scholasticism was to fuse philosophy and theology into a complete system free from inherent contradictions, to exhibit the harmony of natural and revealed truth, but the trend of modern thought has been to emphasize the breach between theology and science. The historical consequence has been that the original ascendancy of the former over the latter has in the long struggle yielded to the asserted dominance of science over official creed. While it was the endeavor of scholasticism to unite the dogmatic theology of the Church with philosophy, it has been the endeavor of modern philosophy to divorce them and to erect a purely rationalistic and scientific system of truth. The philosophical significance of scholasticism is apt, however, to be underestimated. It was the interpreter of questions that were vital for that age, an age in which the one question was confined to the relation between revealed and natural truth. Their fundamental problems, however, the problems of universals, of the relation of faith to reason, of mysticism, of the claims of revealed truth, are neither artificial subtleties, nor are they as yet settled.

Professor of Ancient and Mediæval Philosophy,
Cornell University.

SCHOLIA and SCHOLIAST. See SCHOLIUM.

SCHOLIUM, plural **SCHOLIA**, a marginal note or comment: specially such note or remark made upon a passage of any of the writings of the Greek or Latin classic authors by early grammarians. The writers of these scholia, the scholiasts, are mostly anonymous.

SCHÖNEFELD, shé'ne-félt, Henry, American musician; b. Milwaukee, Wis., 1856. He studied in Leipzig in 1874–79, and afterward engaged in teaching, composing and conducting in Chicago. He was among the first composers to use the folk melodies of the American negroes. Author of two concertos and numerous instrumental pieces.

SCHOOL, The Corporation. A corporation school is one maintained by a business concern, and not under public supervision and control, having for its purpose the training of new employees for efficient service, or for the further training of older employees to fit them for positions of greater responsibility as foremen, executives or technical experts. Probably the first such corporation school was one established by the Chaix Printing Company, of Paris, France, in 1863. The oldest American school was founded by the R. Hoe Printing Press Company of New York in 1875. Most of the corporation schools now in operation have been organized since 1905.

The National Association of Corporation Schools was organized 24 Jan. 1913. The object of the association is to aid corporations in the education of their employees by providing a forum for the interchange of ideas, and by collecting and making available data as to successful and unsuccessful plans in educating employees.

Many different types of corporation schools are maintained and for every variety of purpose.

The "special training schools" are generally schools open to college graduates and other technical men. The students usually enter directly from college with little or no executive or business experience. Such schools aim to connect up as soon as possible the theoretical work of the technical school and the practical routine of the manufacturing or commercial institution.

The "company continuation schools" generally admit any employees who desire to enroll. Their purpose is to aid such employees to equip themselves for advancement by means of either technical or general training. Such schools are maintained by the Curtis Publishing Company, the General Electric Company, the International Harvester Company, the Standard Oil Company of New York, the Fox River Shipbuilding Company, the Yale and Towne Manufacturing Company and many others. Sometimes these schools are on a co-operative basis and the "study" part of the school is conducted under and administered by public or private school authorities. In the case of co-operation with public schools the "educational work" is usually paid for out of public funds. Frequently the company pays the student for the time spent in school as well as for that spent on productive work.

Special training schools and company continuation schools are maintained for the training of wholesale and retail salesmen and office workers, as well as for the training of persons connected with industrial enterprises and the business of railroading and transportation and public utilities.

"Schools for unskilled laborers" furnishing instruction in common school subjects or for the teaching of English to foreigners have been established in increasingly large numbers since 1916. One of the most fruitful sources of accidents in factories is the inability of foreigners to understand English. The teaching of English to foreigners is being fostered by the United States Bureau of Education through its Division of Immigrant Education.

In some States the work is being carried on

under public guidance or under public supervision and control and at public expense.

The Ford Motor Company has enrolled as high as 2,700 foreigners in the Ford English School.

The trade apprentice schools are probably the most important type of corporation school in that they serve by far the largest number of employees. The National Association of Corporation Schools in 1916 reported almost 30,000 students in corporation schools maintained by member companies of the association. Apprentices are accepted usually at the ages of 16-20 and under definite agreement as to rate of pay, period of apprenticeship and character of training to be given. The academic and technical part of the apprentice training is frequently given on a co-operative basis in public or private schools, while the practical trade is given in the shop under the actual shop conditions. Sometimes a concern will set apart a special shop or section of the plant for the giving of the apprentice training, placing this department in charge of a foreman who serves as an apprentice teacher.

Under the terms of the Smith-Hughes Federal Vocational Education Act a portion of the funds which are distributed to the States for trade, industry and home economics education must be used if at all for part time or continuation schools under public supervision and control. It is, therefore, probable that practically all of the academic and technical instruction will be given to trade apprentice school students by public school teachers in the near future, either in the public schools or as is possible in the factories and business establishments.

LEWIS A. WILSON,
Director, Division of Agricultural and Industrial Education, The State Department of Education, N. Y.

SCHOOL BUDGET. The modern school budget provides for a fourfold classification of school expenditures, (1) by *function*, or the kind of work performed. The functions of a public school system are (a) a regulative and executive service by the school board and the superintendent; (b) instructional service, subdivided into supervision and teaching; (c) proprietary service, consisting of the provision, care and disbursement of funds, supplies, equipment of buildings; and (d) auxiliary and social services such as health, library, lectures, recreation, provision for indigents, etc. (2) Expenditures by *character* showing the fiscal nature of the transactions as administrative, operative, upkeep and capital outlay. (3) Payments classified by *objects* of expenditure; (a) personal service; (b) services other than personal; (c) supplies; (d) equipment; (e) buildings and non-structural improvements. Finally a classification by *location* indicates the department office or school building or playground to which each payment is chargeable.

SCHOOL DISTRICT. See DISTRICT.

SCHOOL EXAMINATIONS. No successful means of testing knowledge or of determining intellectual progress without some form of examination has yet been devised. The history of education affords frequent evidence of the attempt to free school children from this universal bugbear. The examina-

tions persist, however, and are freely employed by those who approve of them, by those who condemn them and by those who regard them as a necessary evil. The truth seems to be that no better way of gauging school progress has been found, or is ever likely to be found, and that it is the careless misuse, and not the legitimate employment, of examinations which so frequently condemns them. Examinations in some form or other characterize the administration of our schools throughout the country.

The State of New York has the most highly organized system. The country boy in New York who desires to become a physician, for instance, in pursuing the usual course, is advanced from grade to grade through a system of *grade* examinations, is admitted to high school through a system of *preliminary* examinations, is graduated from high school and admitted to college, or directly to a professional school through a system of *regents* or *academic* examinations, gains credit in college or professional school subject by subject by passing of examinations, and is finally authorized by the State to practise medicine by passing a medical *licensing* examination. The situation in other States does not differ materially so far as the individual is concerned. New York simply sets up the educational barriers more conspicuously than other States and exercises larger central authority in their administration.

Certain general principles may be said to underlie any system of school examinations which is calculated to be a sound means for producing a useful end and which does not confuse teaching with examining. These general principles may be stated as follows: (1) The examinations should be confined to soundly conceived and clearly announced courses of study; (2) Admission to all examinations should be predicated upon reasonable evidence of the successful completion of the courses of study upon which the examinations are based; (3) Persons actually engaged in teaching should have some part in the framing of question papers, and all examinations should be framed so as to discover what the candidate knows and can do rather than what he does not know and what he is unable to do; (4) Answer papers in all examinations should be rated by thoroughly qualified persons in accordance with settled methods of procedure, without settled determination in advance of the rating as to the exact forms or character of a perfect answer; (5) The credentials springing from examinations should be a reward of merit, and should have generally acknowledged value.

The examination system which is founded on these principles will not yet be free from criticism because the inevitable tendency of any examination system is to emphasize *stuffing* at the expense of *teaching*. The end of life is after all "not knowing, but being." There is truth in the charge that teachers are often so absorbed in the sharpening of their tools that they almost forget the objects upon which they are to be used. Now an examination rightly used is never more than a tool, is not the object of all teaching, but only an incidental means of testing the results of teaching. The real danger in the employment of any examination

system lies in the tendency to make the examinations fundamental rather than incidental. As tools in the hands of teachers, examinations serve useful ends in affording passports for individuals and in setting standards by which institutions may judge themselves; as the masters of teachers, examinations dwarf teaching and defeat the whole purpose of education.

Further reference to the system of examinations employed in the State of New York may serve to illustrate the above statements. The State does not offer any of its examinations as a mere intellectual game of chance. The underlying purpose of the State is missed entirely when whole school systems and when individual teachers employ examinations to test knowledge or to gauge capacity in the way in which we cast a die or toss a ball to settle a dispute. It is after all, as has been intimated, not the wise use, but the flagrant misuse of soundly conceived examinations, which not infrequently brings them into educational disrepute.

The experience of the New York country boy on his educational way to the practice of medicine may be in further point. The certificate of advancement from the fifth to the sixth grade or from the sixth to the seventh grade which he secures from the district superintendent of schools upon passing the prescribed grade examinations is not in itself evidence of sound primary training. The certificate means, if it means anything, not simply that the boy has passed certain examinations, but that he has spent a given time in school in the study of the subjects in which he has been examined, and that he has with some determinable degree of success pursued the courses laid down by the State and in the way suggested by the State.

The preliminary certificate which he later receives at the end of his grammar school course is not in itself proof of his ability to go on with work of high school grade. If the certificate has any value whatever, it must carry with it not simply evidence that its possessor has passed reading, writing, spelling, geography, arithmetic, elementary English and elementary United States history in the preliminary examinations, but also that he has completed the work of the elementary school course through the eight grades as laid down by the State in its elementary course of study, and that he is believed to be ready for advancement.

The academic diploma or college entrance diploma which the young man secures at the end of his high school course as a result of academic examinations taken throughout that course is not, if it is worth anything, the product of the casting of a die or the tossing of a ball. It is the reward given by the State to a faithful student who has put in four years of serious successful study in a school of approved grade, and is the official declaration of the belief of the State that the holder is qualified to begin advanced work in college or professional school. It is not simply a record of creditable passing marks. It is official evidence of one's profitable association with his fellows for four years. It is official evidence of the accomplishment of a purpose.

The medical licensing examination which this patient youth meets in turn after long in-

tellectual discipline is simply the means employed by the State to determine who shall and who shall not practise medicine; in other words, to separate medical practitioners from other persons. The State's chief concern in the licensing of its physicians is not in its own examinations which admit to practice but in the sound preliminary schooling of the candidate and in his four years of systematic study of medicine in an approved medical college. The examination is the State's label and not its fundamental concern.

Thus it can hardly be too strongly urged that any system of examinations, however constituted, should be a means and not an end of teaching. The examination never ought to be of itself alone a court of last resort to determine the knowledge and power of a student; it should be only one of the many useful agencies employed by a wise teacher incidentally to impart knowledge and fundamentally to develop power. Wisely used and properly controlled, a soundly conceived system of school examinations may do unmeasured good; allowed to dominate teaching and to control schools, it may become a positive menace. The school, or the system of schools, is safe which *uses* examinations and does not become *possessed* by them.

HARLAN H. HORNER,

Dean, State College for Teachers, Albany, N. Y.

SCHOOL GARDENS. In America, school gardens originated in the city. The children of congested living show a marked loss in certain broad educational attainments. Training in the care of living plants and of animals will supply in a large measure this necessary development. This training will give sympathy, love for the beautiful, ability for self-support, physical vigor and moral stamina.

The high cost of living, and particularly the intensive necessity for food production brought on by the World War of 1914, has greatly emphasized the school-garden work. The potentiality of the backyard garden in suburban parts of cities and towns, and the great value of the garden at the school as a model and as an incentive, has been increasingly accepted since 1914.

The school garden is a term used to cover the agricultural operations conducted under the auspices of the school. The garden may be at the home of the child, on a vacant lot, in a park or on school grounds. It is still a school garden so long as the school controls or directly influences it. Children's gardens conducted by other agencies than the school, such as gardens conducted by commercial institutions, welfare associations and private individuals, are properly called school gardens in the sense that the agencies operating those gardens for children are undertaking an educational function. This work is, therefore, properly the school-garden work of the conducting agency.

Valuation.—Almost every possible educational value has been given to school gardening. It is undoubtedly of the greatest physical benefit for growing children to work in the open. Children must also learn much of natural phenomena, growing plants and the living organisms given to their care. A full discussion of these more evident values could be carried on profitably at great length, but the particular

necessity of school gardening for city children lies in the following comments:

Background of Experience.—Before the child can learn to talk and write and compute with forcefulness, he must have come into intimate knowledge with things, and especially with animate things, in order that he may have something to talk about, or to write about, or to calculate upon. He must live the life. He must come into the experiences of his race. The city child is peculiarly denuded of these human experiences. The child that trains a plant from seed to fruit must learn not only to love the plant but he must acquire the skill to grow plants.

Idealization of Best Living Conditions.—The school garden that does not blossom in the home garden is a poisonous weed. The child will never do at home that which is beneath his teacher at school. When there is a garden at the school and the teacher works with the child, then gardening becomes positively worth while; it has its social valuation. Father, mother, and child alike, become proud of the home garden. If they have no home garden, they move into less congested quarters, where they can have a home garden. This is the result of the idealization of garden work under the auspices of the school. The school and the church naturally establish the ideals of any community.

Self-Support Emphasized.—The school garden, when managed properly, must tend toward teaching self-support. The child soon learns that he can grow something of value and that that value is real food. He learns responsibility and his place in the world as a worker and a supporter. He comes into a feeling of ownership and of positive individuality. He differentiates himself from his fellow. He thinks in terms of freedom. He acquires high incentives of attainment, and higher ideals of sympathy, love and brotherhood.

History.—In America, the school garden movement had its beginning in the city of Boston in 1891, when Henry L. Clapp, principal of the George Haven Putnam School, established a wild-flower garden at his school. This beginning was formally published as a school garden, and the efforts in the schools of the country, which have been more or less regular, doubtless originated from this beginning. It is notable that in this effort in Boston, and in all the efforts that have followed it, the education of children has been the great aim. America has not taken up school gardening so much by way of increasing agriculture as to increase the potentiality of education. The school garden has been considered everywhere the laboratory of natural science, and has been further looked upon as a valuable all around means of child training. This motive was very different in the inception of school gardening in Europe. We find that as early as 1869 Sweden and Austria passed laws requiring the wide establishment of school gardens. France did so in 1880, Russia, Belgium and England followed with school garden requirements. In Switzerland, however, we find that education by means of school gardening was a large motive in the work, but in all other countries of Europe it appears to have been undertaken to promote agriculture as an industry. This

SCHOOL GARDENS

1 School Garden, Public School 89, Brooklyn, N. Y.

2 A class at work on a 10-acre School Farm at Pelham Bay, Bronx, New York City

motive materially affected the method of teaching school gardening in Europe so that little has been gained by those teachers in America, who have gone abroad to study school gardening, that could be directly adapted in this country.

In 1904 Sir William Macdonald, of Montreal, Canada, established some 20 gardens in the various provinces of Canada. This became the initiative of a great interest in elementary garden work in Canada, and large grants on the part of the Dominion government have been made to encourage the work since that time.

In 1897, John H. Patterson, of Dayton, Ohio, founded a boys' garden at the National Cash Register Company grounds. This was the first and most successful children's garden known in America. Nearly all of the children's gardens, especially those conducted by welfare organizations and private individuals, have imitated this endeavor in Dayton, Ohio. For more than 20 years Mr. Patterson's effort there has grown and has become more thoroughly established with each season. Early in the century a number of normal schools established school gardens, notably the one at Hyannis, Mass., and it is reported that the Cook County Normal College, in Chicago, had a school garden in 1885. In 1900, the Cleveland Home Garden Association sold penny packets of seeds through the schools to the children of Cleveland. This originated a plan of seed distribution which has been taken up by a number of other cities as well as commercial houses and has greatly facilitated the movement. In 1902, Mrs. Henry Parsons, of New York, started the Children's Farm in the De Witt Clinton Park. This farm and three other large farms have been maintained by the Park Department of Manhattan ever since that time.

Cleveland, Ohio, and Philadelphia, Pa., were the first cities to formally accept school gardening as a part of the regular school work. These cities have conducted regular school garden work for more than a decade.

The United States Bureau of Education, in 1914, established a school garden department. It emphasized the home garden side, and termed it "School Supervised Home Gardens." This work has grown, and has lately been given a large Federal grant to operate the United States School Garden army, so that in the last 25 years the school garden movement in America has become a distinct educational factor and a distinct economic gain in accelerating love and interest in garden work in thousands of schools and millions of homes in the United States.

School Garden Types. *The Garden at School*—Indoors, the school can support the schoolroom window box and schoolroom flowerpot. The greenhouse on the roof of school buildings is the most practicable, and it may serve as the laboratory for nature study and the natural sciences as well as in part for physical science. Plants may be planted at school by the children and then taken to their homes to be grown, and later exhibited at the school. Class lessons in care of plants, planting seeds, transplanting, watering and other exercises can be easily conducted in the schoolroom. The outdoor garden at the school should be as near to the school building as possible.

It should be on school property and large enough to contain 40 plots, each plot not smaller than 50 square feet. This will accommodate one class, or grade, and presupposes that all children may have direct work in the school garden, at least during one grade of their school course. One teacher in a given city school should be the teacher of gardening, and preferably a teacher of elementary sciences as well. The garden work should be part of the curriculum, and credit for it should be given as for any other subject.

The best vegetables to begin with in school garden work are evidently the hardy, short season varieties. Beans, beets, kohlrabi, radish, Swiss chard, cabbage, tomatoes, carrots, lettuce, corn, are undoubtedly the best. The best flowers for school garden work are likewise the hardy annuals and long blooming varieties. Sweet alyssum, nasturtium, marigold, asters, zinnia and cosmos are leading varieties.

It is always best to fence the school garden, if not to protect against petty thievery, then it should serve to keep out dogs, cats and other small animals. The school garden should be supplied with running water; should have good drainage; should be in the sunlight and should be richly fertilized. The work may be done with few tools, but a hoe should be supplied for every pupil. Rakes, watering cans, hand weeder, spading forks and garden lines are the principal additional tools required.

The Garden at Home.—The garden at the home of the child has hardly been operated by the school long enough to develop acceptable standardization. There is a general agreement, however, that a home garden, managed by the schools, should be visited by teachers, or those who understand gardening, as frequently as possible. The child should keep a complete record of his garden work according to acceptable standards, and his record should be examined and rated. His garden should be rated at each visit, and instruction should be given in the garden, as far as possible, but the major part of the instruction must of necessity be given at the school garden, if the expense of home garden work is to be kept within the possible appropriation. It would, therefore, seem that the school garden and home garden must go hand in hand if any high attainment in gardening is to be accomplished.

Management of School Gardens.—In the management of school gardens the point of view is important, and on account of agricultural demands the education of the child is very liable to be subordinated. The child is greater than the produce. In other words, it is much better that a child plant a row of radish seeds with his own hands, and cover it with his own hoe, than it is to have the teacher plant that row while the child looks on. The radishes planted by the teacher would undoubtedly do better than the radishes planted by the child, provided the skill of the teacher is what it should be, but the child is undoubtedly taught much better by doing every possible agricultural act himself in the school garden.

Individual Project.—This is undoubtedly the very best means of facilitating successful school garden work. Every child who is able to do garden work should work out his own individual project or problem in agriculture on a plot of ground assigned for his sole use.

This individual plot of ground may vary in size according to the age, sex and experience of the child, as well as neighborhood limitations, from 50 square feet to 800 square feet. As a rule it is best that no individual worker grow less than five vegetables, presupposing that these five vegetables may be followed by four or five others at a second planting. This produce provides for educational experience and also for a continuity of interest. For example: If a child were to plant his entire plot to lettuce, he might take the entire crop of lettuce out on the 20th of June, and his interest, of course, could not be retained in his work during the rest of the season.

Produce for the Child.—Each child should have the produce which he raises on his own individual plot. This gives educational experience and retains interest. When conducted by the school, the direct collections of money for produce is most objectionable. It, therefore, should not be undertaken. However if funds are greatly needed by a given agency undertaking school garden work, it would seem as if each individual worker might be taxed a certain percentage of his produce to maintain the common garden.

Course of Study.—One of the greatest hindrances to school garden work is that it has found such slow acceptance in the regular course of study of the school. This has doubtless been due to the fact that the schools are not in session during the chief growing season, which is summer. Shop work, cooking and other manual arts have been placed in the curriculum, and credit for attainment has been given to pupils. But not so generally with school gardening. School gardening can never come into its own until it is placed in the curriculum, either as an industrial art or as a natural science. Pupils who attain the desired standards should be given credit.

School Program.—Another thing that has hindered gardening in schools has been the fact that the work can be done outside of what are termed the regular school hours, so that many schools have failed to program school gardening at all as a regular exercise. It, therefore, loses value with teacher and pupil alike. It should be done continuously or not at all. Consequently, the movement has suffered greatly from gardens not properly attended to, which have grown up to weeds.

Garden Teacher.—The school garden teacher should be one of the regular teachers in a given school. The departmental plan of teaching provides for sufficient specialization. The teacher of the sciences, as a rule, should have charge of school gardening.

Support and Control.—If school gardening is worth while as an integral, educational factor,

then it is worth regular public support. The school appropriation for a given city should carry the school garden work. It is indeed unfortunate that welfare organizations have too frequently been entrusted with a burden too great for them to carry long, and hence valuable and devoted effort have frequently ended in dismal failure. Every city in the land with a population over 100,000 should employ a school garden director to administer this work.

The possibilities of food production in large cities where great suburban tracts have been divided up into partly improved city lots have grown out of the school garden development. In many cities large community gardens have been successfully managed. The people have formed a garden club and the nearest vacant lots have been divided into family plots of from 800 square feet to 12,000 square feet each. The features of the Community War Garden have been a number of small family gardens in one group, and these gardens have been upon vacant lots. Some few communities have been able to maintain the gardens in walking distance of homes. A great variety of management has resulted. A city department for food production and conservation should follow these food gardens in our cities. The growth of school gardens has been most striking. Nearly every city in the United States and Canada now has some form of school gardening. The United States School Garden army reports an army of 1,500,000 children gardeners for 1918.

VAN EVRIE KILPATRICK,
Director of School Gardens, Department of Education, City of New York.

SCHOOL SAVINGS SYSTEMS. The savings bank section of the American Bankers' Association in a report with respect to the extent of savings of schools gives the following statistics as of 1 Jan. 1915, or the nearest date thereto. It appears that the school savings system is in operation in schools located in 280 cities. The number of schools having school savings banks is 1,925, with 928,784 pupils enrolled. Of the pupils enrolled 398,540 are depositors, and the amount of their deposits is stated at \$1,792,640.10. There are 37,051 depositors in individual school banks, 334,964 in systems, and 26,525 over the counter, as detailed in the appended table.

SCHOOL SAVINGS.

	Number of schools	Number of pupils	Number of depositors	Amount of deposits	Number of accounts transferred to regular bank accounts
Individual schools.....	283	136,282	37,051	\$305,195.57	11,783
Systems.....	1,482	704,722	334,964	1,170,068.67	91,476
Over the counter.....	160	87,780	26,525	317,375.86	1,736
Total United States (280 cities).....	1,925	928,784	398,540	\$1,792,640.10	104,995

The individual school system is not under the control of the superintendent of schools or board of education. The term "systems" refers to the savings systems installed in all schools by the board of education or superintendent, the accounts being kept in the superintendent's office. The term "over the counter" is applied to those schools where the deposits are not collected in the school, the system being operated directly through the bank.

SCHOOL FOR SCANDAL, The. Sheridan's 'The School for Scandal' was produced 8 May 1777, by the author himself as manager and part owner of Drury Lane Theatre, which he had taken over some time before from Garrick. Unlike the earlier 'The Rivals' the play was an instant success. It ran 20 nights the first season; 65 nights the second season, and has held the stage ever since.

'The School for Scandal,' the only play of later date to challenge comparison with Congreve, may be studied as an index of dramatic tendencies since the Restoration. The movement for correcting the morals of the stage, traces of which were seen in 'The Way of the World,' have now culminated in a definite brand of technique. Though scandal is spoken in the play none is actually seen in the action. The polite subterfuges demanded by modern English taste have begun. The tradesman has been introduced into comedy. Moreover, though Sheridan ridicules sentiment, the primary action of the play revolves around a sentimental motive. Joseph Surface is a false sentimental hero, while Charles Surface is a true sentimental hero. Oliver and Rowley are characters from sentimental comedy.

'The School for Scandal' is of the school of Congreve once removed. Whereas Congreve conventionalizes life, Sheridan conventionalizes the stage. With Congreve, wit is the specific; with Sheridan it is entertainment. 'The School for Scandal' is a crowded fabric of "situations" derived from a broad reading of English comedy and an intimate acquaintance with the stage. Much worked over in composition out of scattered scenes and different plays, the central idea of a school for scandal goes back to the cabal nights of Lady Wishfort in 'The Way of the World.' Action has become more important than speech, and events follow each other in rapid succession. There is little repartee. The brilliancy of give and take gives way to broken monologues. Dialogue serves not as a fencing of wits but as the rapid patter of characters manipulated through a fore-ordained intrigue. To keep the conversation running rapidly is the first requirement. Therefore a spirit of raillery is maintained.

When these things are said it must be admitted on the other side that the play occupies a significant position. It was the last of the comedies of manners and the first of the modern plays of entertainment. The former were written for the discriminating; the latter for the crowd. The plot is regular and expert in the handling of a crowded action. In theatrical "effects" the play has been a storehouse of devices for a century of writers of comedy. On account of its adjustment of old materials to the requirements of the new day the play has maintained vitality unabated to this day. Editions: Rae, W. SCHOOLCRAFT, skool'kräft, Henry Rowe, American ethnologist and author: b. Watervliet, Albany County, N. Y., 28 March 1793; d. Washington, D. C., 10 Dec. 1864. He was educated at Middlebury and Union colleges, in 1820 was made geologist to an exploring expedition under Gen. Lewis Cass to the Lake Superior copper region and the upper Mississippi, and in 1822 became Indian agent for the northwestern frontier, with headquarters at first at Sault Sainte Marie and later at Michilimackinac (or Mackinac). From 1828 to 1832 he was a member of the Michigan territorial legislature. He commanded in 1832 the expedition which discovered the sources of the Mississippi, and in 1836 concluded with the Indians about the lakes a treaty by which cession of 16,000,000 acres of land was made to the United States. Soon afterward he received the appointment of acting superintendent of Indian affairs and disbursing agent for the northern department. In 1847, he began the preparation, under government appointment, of his elaborate work, 'History and Statistical Information Respecting the History, Condition and Prospects of the Indian Tribes of the United States' (1851-57). For the first five volumes an appropriation of nearly \$30,000 per volume was made by Congress; the sixth and last was published at the expense of the War Department. The work was finely printed, and illustrated by 336 plates. It was the first means of introducing Indian legend and tradition to the general reader and gained a considerable reputation as a work of scholarship. Parkman, however, whose opinion is of very high value, considers that the work was quite inadequately done; particularly in view of the unusual facilities placed at the author's disposal. Among Schoolcraft's other volumes are 'Algonic Researches' (1839); 'Oneota; or Characteristics of the Red Race of America' (1844); 'Personal Memoirs of a Residence of 30 Years with the Indian Tribes' (1851); and 'Scenes and Adventures in the Semi-Alpine Regions of the Ozark Mountains' (1853).

SCHOOLEY PENEPLAIN. See PENEPLAIN.

SCHOOLS, Bible in the. The Bible may be used in schools for one or both of two quite distinct purposes. It may be used for the purpose of establishing or confirming religious convictions or it may be used simply to give familiarity with and appreciation of a great body of poetic and historic literature, the most important, perhaps, that the world has produced. The use of the Bible for the first of the purposes mentioned is, in the nature of things, restricted in all countries where there

is no established Christian church. In the United States where all sects and all denominations stand upon an equal footing, it would be manifestly improper to levy a general tax to maintain religious instruction, which, in many cases, would be heresy to some. In private institutions founded by particular religious organizations and maintained for the purpose of promoting and fostering particular religious sects, Bible instruction would be not only eminently fitting and proper, but, in fact, essential to the accomplishment of the purpose for which such schools exist.

In the early colonial days in the United States, schools were, for the most part, maintained by the churches. Religious instruction based on the Bible was, in the schools at that time, an essential part of the curriculum. But public education in the United States has now become thoroughly recognized as a State function and as a result religious instruction has been excluded from the public schools. In a few cases, for example, in New York City, the reading of the Bible without comment is a daily exercise required by law, but such cases are few. In most States of the American Union the reading of the Bible in the public schools without comment is permitted by the common law if no objection thereto is made, and the practice of such reading is quite general, but where the question has been raised, the decisions of the courts have been uniformly against the practice.

Victor M. Rice, State superintendent of public instruction in New York State in 1866, said that "the proper places in which to receive religious instructions are the churches and the Sunday schools." Judge Lyon of the Supreme Court of Wisconsin in an opinion given in 1890 holds that the reading of the Bible in the public schools constitutes sectarian instruction. Decisions of the same tenor have been given by superintendents Weaver, Gilmore, Van Dyke, Rice, Spencer and Ruggles of New York State, and similar opinions have been rendered in other States.

But this exclusion of religious and Bible instruction from the public schools has not in any degree lessened the belief in the importance of such instruction, but has resulted in a new movement, which has for its purpose a wider dissemination of knowledge regarding this great literature through study carried on outside the school, but still having certain relations to the school.

We are just beginning to appreciate the fact that knowledge and culture in any field may be acquired outside the school. Formal regulations have been adopted in many States for giving credit toward the completion of a high school course for study carried on outside the school and this plan has been extended in many States to include credit for Bible study. Such work is already definitely organized in the following States: Arkansas, California, Colorado, Idaho, Illinois, Indiana, Iowa, Kansas, Michigan, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, Oregon, Texas, Virginia, Washington, West Virginia.

The plan adopted varies somewhat in the different States but in the main it includes the following definite features:

(1) A syllabus indicating definitely the parts

of the Bible that are to be studied and the points that are to receive special attention.

(2) A definite period of study at home or in Sunday school under the instruction of parents, Sunday school teachers, or ministers of the gospel.

(3) A written examination conducted at the school by the school authorities.

(4) The crediting of the subject, if the examination is successfully passed, toward a regular high school course.

In many cases the syllabus and the question papers are prepared by committees which contain Catholics, Protestants and Jews, and the answer papers are read and rated by similar committees.

Courses have been arranged on this general plan covering full four years with specific assignments for each year.

Following is the outline of the course now in operation in the State of Colorado:

Course I. Heroes and Leaders of Israel.

Course II. First Semester. The Friends and Followers of Jesus.

Second Semester. The Life and Labors of Jesus.

Course III. First Semester. Bible History.

Second Semester. Biblical Literature.

Course IV. Social Institutions and Social Application of Bible Teachings.

1. The Family and the Community.

2. The State and the Church.

3. The Industrial Order.

CHARLES F. WHELOCK,
Assistant Commissioner for Secondary Education, The University of the State of New York.

SCHOOLS, Continuation. The term "continuation school" may properly be applied to any type of organized educational effort having for its purpose the continuation of the education of children or of adults after they have left the usual elementary or secondary schools as regular attendants and while they are engaged for part or the whole of their time in gainful occupations. Under this definition the term would include (1) night schools, (2) part-time schools, (3) special industrial schools carried on by business organizations, (4) correspondence schools, (5) University extension courses, (6) the educational work of the Y. M. C. A., the Y. W. C. A., the Boy Scout Movement, the Girl Scout Movement and home reading circles of various kinds. There is a present tendency, however, to limit the term "continuation school" to schools offering part-time instruction to boys and girls under 18 years of age and who are engaged regularly in gainful occupations.

The United States Federal Board for Vocational Education gives official sanction to the following definitions:

"A part-time school is a school open to minors and adults who have entered upon employment. When the school aims to complete general education, it is designated a part-time continuation school; when it aims to increase skill and intelligence in a vocation other than that in which the pupils are employed, it is a part-time trade preparatory school; and when it provides training that is strictly supplementary and related to the employment of its pupils, it is a part-time extension school."

The need for the existence of continuation schools is found in the fact that even under compulsory attendance laws, a large number of children of 14 years of age or over are obliged

to leave school and go into industrial employment before they have completed even the elementary grammar grades, while the general education of those who leave school after having completed the grammar grades is frequently so defective that their opportunities for advancement after entering an industrial occupation are very limited. From the investigations of the Elementary Board for Vocational Education it appears that in the United States "there are about 5,000,000 children between 14 and 18 years of age out of school, and that practically all of the boys and a large proportion of the girls not at school in these ages are at work. A very large proportion of these workers have left the public school without completing an elementary education or preparing themselves for any specific vocation." Moreover, modern industrial conditions tend to make the kind of occupation open to this class of children extremely monotonous and deadening to all intellectual activity. Such occupations consist usually of the repetition of a single simple operation or the operating of a single machine; hence, there is offered almost no opportunity for acquiring general knowledge of any trade as a whole and consequently almost no opportunity to progress in earning ability such as was afforded under the now almost obsolete apprentice system.

The principal specific purposes of schools organized to meet this situation are: (1) general education looking toward general culture, broader vision and better citizenship; (2) pre-vocational training and vocational guidance looking toward the better adjustment of the individual to his job; (3) training for a specific industry; (4) instruction supplementary to that received in the shop or factory practice in which the student is engaged, looking toward improvement in such practice; (5) instruction in homemaking for girls. The evening school was the earliest form of continuation school and such schools have been in existence in most European countries as well as in the United States for about 100 years. At the beginning such schools were intended to give instruction in the three R's only and were attended chiefly by those whose early education had been entirely neglected. Gradually the field covered has been extended until at present, in many cases, they offer complete high school courses in the subjects regularly offered in the day high schools, but the trend is toward industrial and commercial courses and homemaking. Evening schools, which are tax-supported, now exist in most of the cities and larger towns of the United States and of Europe. Attendance upon these schools is mostly voluntary, but certain classes of students who have failed to complete courses in elementary schools are required to attend either evening high schools or some other form of continuation schools.

One serious difficulty in the way of attaining the desired end of a continuation school through the evening high school is in the fact that the student fully employed during the day is not in physical or mental condition to benefit to the fullest extent from evening study and instruction. To avoid this difficulty, part-time schools have been organized. In these schools students are occupied in regular remunerative employment for a portion of the regular working hours and are in school dur-

ing the remaining working hours, work and school thus alternating. In some cases students are employed alternate half days and are in school alternate half days. In other cases entire days are given to work and alternate days to school. In still some other cases alternate weeks are given to school and to work. In this way a uniform attendance is secured time school students are divided into two equal groups. Students working in any particular shop, factory or business concern are divided into two groups which alternate, one group being in school, the other group being at work. In this way a uniform attendance is secured both in school and on the job thus permitting the employment of a constant teaching force and a constant working force. The special school organized and conducted by business concerns aims more particularly to give to the employees of the concern such instruction as will render them more efficient in the particular work which they are called upon to do. Such schools are of more recent development and are increasing in number. In these schools the usual procedure is to combine in each day's work some hours of instruction and some hours devoted to the regular occupation. The special schools conducted by the New York Central Railroad and by the Wanamaker stores are well-known examples of this sort of organization.

In some of the States, notably in Pennsylvania and Wisconsin, statutes provide that children between 14 and 16 not in regular attendance at day schools, whether at work or not, must attend continuation classes for certain hours each week, and if such children are employed they must be released from employment during these hours, and the laws in these States also provide that schools must be established and maintained under public instruction and control for this purpose. Movements in several other States are already under way looking toward the enactment of similar laws. It is evident that the time is not far distant when provision will be made for the compulsory attendance upon some form of continuation school for all children up to 18 years of age who are not regularly in day schools, whether such children are employed or not, and that schools providing the opportunity for instruction of such children especially along vocational lines will become a part of the regular educational system of the country and will be under public supervision and control.

In most of the countries of Europe the part-time vocational school has reached a notable degree of development. For details concerning the development of this movement in the United States, reference is made to the reports of the Federal Board for Vocational Education, Washington, D. C.

CHARLES F. WHELOCK,
Assistant Commissioner for Secondary Education, The University of the State of New York.

SCHOOLS, Inspection of. Various agencies exist throughout the country for the visitation and inspection of schools. Many State universities employ an officer known as a high school visitor whose business it is to determine what schools shall be placed on the university's accredited list for entrance. Such an officer does not ordinarily have any legal

authority but is usually a welcome visitor because of the desire of all ambitious high schools to be enrolled on the accredited list of their neighboring university. Private universities, colleges and college entrance boards also maintain like friendly relations with the secondary schools which prepare students for them. Systems of inspection are also maintained by sectarian organizations for schools under their jurisdiction.

Beyond these various private agencies, practically every State in the Union now makes attempt through its department of education or public instruction to inspect its schools. This authority is frequently exercised especially for the elementary and rural schools through county or township officers. In many States the power of the State department is limited both by statute and by the funds available for the purpose. The State of New York has perhaps the most thorough system of school inspection in the country both through the exercise of central and of delegated authority. The rural schools and the smaller union schools outside of cities and villages of a population of at least 5,000 are subject to the frequent inspection of a group of 207 district superintendents, who are in turn under the immediate supervision of the State department of education. The authority of the force of State inspectors may also be exercised in these schools by direction of the central office, but the State's immediate staff is concerned chiefly with the work of the secondary schools. A brief review of the working of this central system of inspections will present the problems common to all the States. New York's educational system is spreading its influence to other States. The examination system is the backbone of the educational scheme; in one form or another it constitutes the structural framework of the State's relations to its elementary and secondary schools and has an important bearing on the inspection work of the department. The inspection of schools is predicated upon the examination of students, and the valuation of the work of school systems, through the medium of examinations. The examination system inevitably brings to light the result of poor teaching and unwise administration and it is the distinct business of the inspectors with their first-hand knowledge of the weak spots to help schools to provide better teaching and to institute sounder administrative methods. Inspectors find that their work in the field is sharply divided between questions of administration and instruction. The large problem with which the department is confronted in the one-, two- and three-year academic schools, and in the full high schools in the union free-school districts outside of the villages and cities, is primarily one which calls for the qualities of a general practitioner rather than those of a specialist. Questions of sound organization, orderly procedure and definite purpose take precedence even over the always important question of the quality of the teaching. There are upward of 200 changes in principalships in these smaller schools every year. Many of these smaller schools are in a special sense the wards of the State because their frequent changes in management and in entire teaching force as well make continuing local policy impossible. If their work is to be carried on coherently from year

to year and if purposeful results are to be secured, it must be through the immediate helpfulness of the general practitioners of the field staff of the department. The representative who goes into these schools need not be a specialist in this subject or that, but, like the country physician who treats a multitude of ills, he must be an accomplished general practitioner. He must know the courses of study, elementary and academic; he must know the ideals and the aspirations of the leading teachers of the State; he must know how to organize a school, how to lay out a program, how to conduct a recitation and how to observe a recitation politely, kindly and sympathetically. He must know how to correct without reproving, how to advise without complaining and how to praise without flattery. He must know the requirements of the mandatory statutes; he must know good housing from bad; he must know how and where to provide for library and laboratory. He must know human nature well enough and be trained keenly enough in a sensible diplomacy to be able to convince principals and teachers that he means at all times to help them; and he must have iron enough in his constitution, when occasion demands, to deal straight forwardly with a recalcitrant school board. In other words, he must use his good sense quite as much as his erudition.

The highly trained specialist finds a broader field of course in the more stably organized schools. In the larger union schools and in the high schools in the villages and cities, where questions of school administration are in the main matters of settled policy and are ably cared for by local supervisors, the department specialists find wider opportunity to aid teachers in their several groups of subjects, and to set up guideposts as possible attainable standards for all alert, progressive teachers. And the day is coming when the teaching profession will not have room for any others. It is here that the capacity of the field staff is put to its test on its scholarly side, and it is here that its service, if it is to be worth while, must in the long run be of the most significance. A body of trained men, each doing intensive work in a limited field, observing in the course of a year or two the best and the worst teaching in the State, must become in time a clearing-house, from which teachers who seek help may get inspiration and may find out what other successful teachers are doing. There are many schools, soundly organized, with thoroughly trained teachers, where the State cannot be of special service but where it can get help and suggestions to carry to other less fortunately situated schools. All that is best, it is the business of the State to distribute as widely and as generously as possible. See SCHOOL EXAMINATIONS; STATE SYSTEMS OF EDUCATION; UNIVERSITY OF THE STATE OF NEW YORK, and related topics.

SCHOOLS, Instruction in Sex Hygiene in. The importance of the reproductive function in its relations to general hygiene, the alarming prevalence of venereal disease and the amount of damaging misinformation intentionally disseminated by vendors of patent medicines are among the most important reasons that have been urged for the giving of regular instruction in sex hygiene in schools. A feeling of delicacy regarding all reference to sex that

has been developed through centuries of custom, a lack of scientific knowledge of the subject on the part of ordinary teachers, the difficulty of securing reliable data from any considerable number of normal persons and the fear that conscious attention to sex will tend to aggravate rather than to ameliorate objectionable conditions are reasons urged in opposition to the giving of such instruction.

During the period from 1912 to 1915 the subject of instruction in sex hygiene was prominent in the programs of educational associations, and articles on this subject were not infrequent in educational periodicals and in the secular press. During the same period a considerable number of books were published treating various phases of the general question; but since 1915 the subject seems to have been dropped almost entirely and it does not appear that the agitation had any considerable results so far as concerns the introduction of such teaching into the elementary or secondary schools. The one tangible result of the agitation mentioned has been a more candid and fearless discussion in the public press of the extent and consequences of venereal diseases in such a way that this information is now being brought to the attention of all pupils and teachers who read current magazines and newspapers and in a manner that is not open to the principal objections urged against direct school instruction. The need for such direct school instruction in this phase of the subject is, therefore, largely removed.

It is very doubtful if we have yet reached a point where other and important phases of this subject may be properly and profitably introduced as a regular subject of instruction in the public elementary or secondary schools. While it is possible that the problem of general sex hygiene may at some time in the future be discussed in the public schools as scientifically and as frankly as we now discuss circulation, digestion and excretion, it is clear that such a course is not possible under present conditions.

The best high schools are now laying a foundation for such instruction and are preparing the public mind for it by a frank treatment of the fundamental facts of sexual reproduction in plants and animals in connection with the study of botany and of general zoology. Most textbooks in these subjects now present the essential anatomical and physiological facts underlying this subject frankly, scientifically and in a manner that does not offend genuine modesty. It is doubtful whether the schools should attempt generally to go farther than this at the present time. The wise teacher of general hygiene will always impress upon pupils the sacredness of every organ and every function, the importance of cleanliness, of the avoidance of all excesses and abuses, and in that manner will be able to reach the end sought. The problem is not so much one of overcoming ignorance as one of establishing a due respect for the body as a whole. For the present it seems wise to leave more specific instruction to parents or to conferences of teachers with individual pupils after a full understanding between the teacher and the parent of such pupil.

Assistant Commissioner for Secondary Education, The University of the State of New York.

SCHOOLS, Open Air. See HEALTH EDUCATION.

SCHOOLS OF DRAMA, Modern. There have been five great periods of dramatic production in Europe since the Middle Ages. The first took rise in England about three and a half centuries ago, its central figure being the immortal Shakespeare. The next was located in Spain. Temporally it was almost coincident with the first, and its two greatest exponents were Calderon and Lope de Vega. Then came the era of French classicism, represented by Corneille, Racine and Molière. Toward the end of the 18th century we have the period of German classicism, with Lessing, Schiller and Goethe. And within the last four decades we have witnessed the fifth great movement, which is the subject of the present article.

There is a big difference between the first four periods and the last, inasmuch as the former were all confined to particular nationalities, while the latter is cosmopolitan in character. The starting point of the modern movement is to be found in the works of Henrik Ibsen, the great Norwegian dramatist (1828-1906). Ibsen, indeed, may be considered the father of the modern drama. His works—among which may be mentioned 'Ghosts,' 'A Doll's House,' 'Rosmersholm' and 'The Wild Duck'—are characterized by the perfection of their technique, their realistic nature and the ideas or truths which they convey. His central idea is the insistence on true and unhampered expression of the individual's personality. Contemporaneous with him we find two other great Scandinavian dramatists, the Norwegian Björnson ('A Bankruptcy,' 'Beyond our Power,' etc.) and the Swedish Strindberg ('The Father,' 'Miss Julia,' 'Comrades,' etc.). The best works of these also belonged to the realistic category.

From Scandinavia the movement spread in every direction. Hardly a country in Europe, indeed, which has not at present its constellation of dramatic geniuses. In France, to mention but a few, there are Lavedan, Porto-Riche, Hervieu, Brieux and Rostand. In Germany and Austria there are Hauptmann, Sudermann, Wedekind, Schnitzler and Hofmannsthal. England has produced Wilde, Shaw, Barker and Galsworthy; Spain is represented by Echegaray and Galdos, Italy by D'Annunzio and Giacosa; Holland has Heijermans, Belgium Maeterlinck, Russia claims Tolstoi, Gorky, Tchekoff and Andreyeff.

There are two main currents or schools by which the modern drama is represented. The first and most important is the realistic, the other the romantic—or as it has been styled in contradistinction to a previous movement, the neo-romantic. The former is the characteristic product of the age—that which is due to the impetus of Ibsen, and to which most of the writers mentioned, besides many others who have not been mentioned, claim allegiance. The nature of the realistic drama is perfectly expressed by its name. It is a form of art which aims at a faithful depiction of life, without falsification or idealization. In former times this had not been the chief aim. Most previous dramas belonged to the categories known as classic or romantic. The subject matter in many cases was semi-mythical, as in the old

Greek and classic French drama. The characters, if they were real at all, were preferentially drawn from the ranks of the distinguished and high-born; unusual situations and plots were the rule; idealizations were common, and the exalted, unnatural character of the presentation was expressed by the prevailing poetry of the dialogue. All this is changed in the modern realistic drama. The characters which are brought to view belong to every rank of society, even the most humble. The plot loses its artificial character, and we are presented with a natural development of life itself, such as we can witness about us on every hand. Exact directions are given by the author as to the appearance of the actors and the setting of the stage, so as to produce an illusion of reality. And the language takes the form of prose, frequently imitating in its peculiarities of dialect and its exclamations and hesitations the exact form of speech of ordinary, everyday people. Barker's 'Madras House,' for example, shows us people moving about and conversing just as they do in real life. The same is true of the many scenes from society life in the dramas of the French, examples of which may be found in Lavedan's 'Le Prince d'Aurec' and Donnay's 'The Other Danger.' Hauptmann's 'Weavers' and Galsworthy's 'Strife' exhibit the scenes of misery, suffering and revolt which are connected with labor troubles, Gorky's 'Night Shelter' portrays the lowest and most painful aspects of Russian city life. There is little plot to the majority of these plays, just an unrolling of experience and a depiction of character.

It is impossible to go into a detailed exposition of the many excellent dramas that have appeared under the sway of naturalistic ideas. Suffice it merely to name a few of the more important, in addition to those already cited. We shall confine ourselves, in the case of every writer, to a single play. Porto-Riche is the author of 'Amoureuse,' Hervieu of 'La Course du Flambeau,' Becque has written 'Les Corbeaux,' Brieux 'Les Hanneçons.' In German countries Hauptmann has given us 'Fuhrmann Henschel,' Sudermann 'Die Ehre,' Schnitzler 'Der einsame Weg,' Wedekind 'Frühling's Erwachen.' Tolstoi, in Russia, is the author of 'The Power of Darkness,' Giacosa in Italy of 'The Stronger.' In England we have Shaw with 'Man and Superman,' Galsworthy with 'Justice,' Barker with 'Waste.'

On this side of the ocean the naturalistic drama has not found embodiment in many works of superior literary value. In general, American plays do not make much pretense to literary worth, but are written solely for the stage. Many of the most effective are of a local and historic nature, and make telling use of picturesque, scenic and ethnographic backgrounds. Such are Bronson Howard's 'Shenandoah,' Herne's 'Shore Acres' and Moody's 'Great Divide.' Recently, however, there have been promising signs of a genuine literary awakening. And there has been a revival, following the example of England, of dramatic pageants. These are open-air performances, generally of a historic or symbolical nature, in which great numbers of people take part.

As already mentioned, the modern drama has been characterized by a return to romanticism, in addition to the development along

naturalistic lines. The chief exponents of this movement have been Rostand in France, Maeterlinck in Belgium, Hauptmann in Germany, Hofmannsthal in Austria, Yeats, Synge and Lady Gregory in Ireland. Rostand is famous through his 'Cyrano de Bergerac,' likewise his 'Chantecler.' Maeterlinck has written, among other works, 'Pelléas et Mélisande' and 'The Blue Bird.' Hauptmann has given us 'Die versunkene Glocke' and 'Der arme Heinrich.' In part the movement in question has been due to the natural tendencies of the individuals who have furthered it, the romantic disposition being one which is always latent in human nature; in part it has had its source in a reaction against naturalism.

Like all great art movements, the realistic drama is an outgrowth of the age, and forms a faithful mirror of many of its constituent currents. Thus the scientific spirit finds a reflection in its exact observation and accurate description. There is an incident in Hauptmann's 'Einsame Menschen,' for example, which neatly illustrates the principle involved. Johannes Vockerat has just had a conversation with his wife and a friend, in which he has evinced considerable irritability. He leaves the room and steps out on the veranda, where he engages in calisthenic exercises. His wife and friend meanwhile continue the conversation, when suddenly the door opens and Johannes calls in: "Children, I was somewhat irritable. Be merry! I am so too." Though nothing to that effect is said either by the author or the personages of the play, it is evident that the change of feeling is due to the effect of the physical exercise.

The psychological trend of modern thought is also reflected in the realistic drama and comes to view in the mental and emotional nature of the conflicts portrayed. Of action there may be little—nothing but thought and emotion, expressed in words and gestures. The democratic conception of life is apparent in the treatment of the humblest aspects of existence, the prevailing interest in social questions in the nature of the problems that are considered. In general, the subject matter of the dramas is intensely modern. Except for the few scattered romantic plays, there is no looking backward to ages long gone by. Modern labor conditions, modern relations between husband and wife, modern demands for the emancipation of woman—these and many other subjects equally alive form the basis of dramatic treatment.

Along with this community of subject matter and treatment, however, there are national differences between the dramas that are equally pronounced. Thus, there is a strangeness of conduct on the part of the characters in Scandinavian plays that is typical. Ibsen's men and women are subject to morbidly exalted courses of action. Strindberg's people are swayed by the most peculiar reversals of feeling. The question is justified whether these extravagant manifestations may not be brought into relation with the unusual aspects of nature in Scandinavian countries. As Björnson says ('Beyond our Power'): "There is something in nature here which demands the unusual of us, also. Nature herself is beyond all reasonable limits. We have a night which lasts almost the whole winter. And our day lasts almost all summer. . . . Swarms of birds in millions; 'shoals of

fish as long as from Paris to Strassburg' . . . mountains that rise sheer out of the sea. They don't resemble any other mountains. And the whole Atlantic breaks upon them." The question is also apropos whether all this is related likewise to the strangeness of harmony in the compositions of Grieg. In general there is a remarkable analogy between the literary productions of a country and its musical compositions.

This is evident when we come to the dramatic works of the Russians. If Scandinavian plays are eccentric, those of the Russians, like their music, are pitched in the minor key. The outlook upon life, as in Russian novels as well, is melancholy and pessimistic. Tolstoi's 'Power of Darkness' and Gorky's 'Night Shelter' show us humanity at its lowest depths, Andreyeff's 'Life of Man' concentrates into a single picture all the tragedy of existence. If we wish for a more specific analogy from the realm of music, we need but turn to the works of Tschaikowsky, and especially to his immortal Pathetic Symphony.

Spanish plays make constant use of the motif of honor, a fact which harmonizes with Spanish conceptions of life. And in Italy D'Annunzio reflects the passion for beauty which is inherent in the Italian race.

The Irishmen Wilde and Shaw exhibit a talent for brilliant wit and satire. Characteristic as this is likewise of their countryman Sheridan, it must be regarded as typical of the race. And as we meet with similar manifestations throughout the literature of France, it may be regarded as typical of the Celtic people as a whole.

Especially pronounced is the contrast between French and Teutonic dramas. In spite of their naturalism, the French still retain the agreeable exterior. Thoroughly discordant and repulsive aspects of life are rarely brought before us. The personages that are exhibited are mostly drawn from the well-to-do if not aristocratic circles of society. There is the glitter of wealth, education and social eminence. Likewise the conversation is characteristically lucid and polished. The subject matter of dramatic exposition is largely exhausted by the passion of love. Donnay confines himself entirely to this subject, Porto-Riche has collected his plays under the title of 'Théâtre d'Amour.' Furthermore, it is the illicit side of love that is preferentially dwelt upon. The characters in the plays are likely to be few, the number of plays of a particular playwright limited. The style is exquisite, the flow of dialogue smooth and connected. It is a drama that reminds us of the *salon*: polished, fastidious, well-arranged.

Far different in the north. Here it is as if we passed from the restraints of polite society into the boundless freedom of nature. There is a wider range of subject matter, a greater seriousness of interests. The plays are more numerous, the characters apt to be many, the words suggestive and replete with significance. Ibsen's 'Emperor and Galilean,' Hauptmann's 'Florian Geyer,' Galsworthy's 'Strife' are cast in large molds that are rarely found in the south. The subject of love, though by no means neglected, does not hold such exclusive sway. It is merely one of a great number of subjects. In general, there is a breadth and variety of material and interest that are thoroughly

Shakesperean. Hauptmann, especially, illustrates this trait, as his works exhibit every shade of dramatic expression, from harrowing tragedy to light comedy, from crass realism to mystic romanticism. Likewise he is a wonderful por-trayer of character. His men and women remind us of the realistic pictures of the old Dutch and German schools, with their sharply defined, expressive countenances. And there is a brooding, introspective tendency which is thoroughly German. In contrast we have the Viennese Schnitzler. If Hauptmann represents the sombre North German, Schnitzler stands for the mild, light-hearted Austrian. There is a delicacy and sweetness to his works that remind us of the tender strains of his countryman Mozart.

The realistic drama, like the music-drama of Richard Wagner, has been the subject of many controversies. Special theatres were at first required for its presentation (Théâtre Libre in Paris, Freie Bühne in Berlin), as the weight of tradition was strong against it, and many plays were prohibited by the censor. Even to-day there are voices that are raised against its excesses of naturalism. But whatever may be the verdict of posterity, whatever the direction which dramatic expression may take in the future, it has been an honest, inspired form of art, and has given voice to a demand of thought and feeling which was bound to find vent. In art, as in heaven, there are many mansions. There are countless ways of expressing beauty, and no one of these has an exclusive right to be considered legitimate. Furthermore, there is a temporal sequence of expressions which seems to be in accord with evolutionary laws. One form of beauty gives way to another with a sort of necessity, and the very fact that a school is in the ascendant to-day, far from being a reason why it should remain so to-morrow, is the strongest reason why it should yield. So naturalism came as a legitimate successor of previous forms of drama. It will doubtless be superseded by forms that are different. But it will not pass by without leaving its trace behind. As Guyau says, every new work of art changes the very conditions of beauty. So likewise with the works of the naturalistic school. They have added an element of truthfulness and seriousness which will never be entirely lost, but will have its influence on all the works that are to follow.

SCHOORL, shoorl, **SCHOREL**, or **SCOREL**, Jan van, Dutch painter: b. Schoorl, near Alkmaar, 1 Aug. 1495; d. Utrecht, 6 Dec. 1569. At 14 he was placed with the painter Willem Cornelis. Three years later he traveled to Amsterdam, and spent some years in the studio of Jakob Cornelis, one of the most celebrated painters and engravers on wood of that period. He next became a pupil of John of Mabuse, in Utrecht, and subsequently visited

many cities, including Cologne and Spire, where he studied architecture and perspective. He was received kindly by Dürer in Nuremberg. At 22 he passed through Carinthia to Venice, and thence to Palestine. For three years he remained within the walls of Jerusalem sketching views of the city and surrounding country. On his return he spent some time at Rhodes, and afterward at Rome, studying the works of Raphael, Michelangelo and Giulio, till Adrian VI, a native of Utrecht, ascended the papal chair in 1522, and committed to him the superintendence of the Belvedere. The death of Adrian the following year induced Schoorl to return home, which he did by way of France. He now executed many splendid pieces in Utrecht, afterward in Haarlem and from time to time in other cities in the Netherlands. He has been compared with Jan van Eyck, whom he equaled in splendor and truth of coloring, in expression, in warmth of representation; and, at the most, was inferior to him only in the execution of particular parts. Unhappily the rage of the fanatics in a subsequent age for destroying pictures was fatal to many of his most valuable works. Consult Toman, 'Studien über Jan van Scorel' (1889).

SCHOPENHAUER, shō'pēn-how-ēr, Arthur, German philosopher and man of letters: b. Dantzig, 22 Feb. 1788; d. Frankfurt-on-the-Main, 21 Sept. 1860. He was of Dutch ancestry on both sides. His father, Hendrick Schopenhauer, was a rich merchant, whose love of freedom was so great that he removed to Hamburg in 1793, when his native city, Dantzig, lost its independence and became a part of Prussia. Schopenhauer's mother, whose maiden name was Johanna Troisner, was a woman of artistic temperament and literary aspirations, some 20 years younger than her husband. After his death in 1805, she removed to Weimar, becoming a member of the literary coterie there, and gaining a reputation as a popular novelist. Heinrich Schopenhauer, proud of his position as an independent merchant, determined that his son should succeed him as the head of the business which he had established. With this object in view, he had him instructed in modern languages, especially in French and English, and took the boy with him on extensive trips through England, France, Holland and Germany, in order to give him a knowledge of the world. When Schopenhauer was 17 his father placed him in a business house in Hamburg. The work was distasteful to him and after his father's death, when he had vainly attempted to accommodate himself to a business career, he decided to follow his bent and devote himself to study. After receiving the necessary preliminary training at Gotha and Weimar, he entered the university at Göttingen in 1809, registering as a student in medicine. Later he studied in Berlin, where he heard lectures from Fichte and Schleiermacher, and finally received the degree of doctor of philosophy from the University of Jena in 1813, on submitting a thesis on "The Fourfold Root of the Principle of Sufficient Reason." After a residence of several years in Dresden, where he wrote his chief work, 'The World as Will and Idea' (*Die Welt als Wille und Vorstellung*, 1818), and a visit to Italy, he qualified as private lecturer (*Privat Dozent*) in the University of Berlin. He came

there with the most extravagant estimate of the importance of his own views, and with the greatest contempt for the prevailing idealistic philosophy, of which Hegel, then at the height of his popularity at Berlin, was the chief representative. Schopenhauer announced lectures at the same hour when Hegel's principal course was given. As a result, his audience was very small; and to make matters worse, his style of lecturing was not popular; his audience fell off and the lectures had to be discontinued before the end of the semester. This embittered him still more, and he imagined that he was the victim of a deliberate plot on the part of various "school philosophers" who had conspired to prevent his views from obtaining a hearing. He made a second visit to Italy, lasting almost three years, but returned to Berlin in 1825, residing here, until 1831, when the epidemic of cholera that carried off Hegel drove him to Frankfurt. Here (with the exception of a short stay at Mannheim) he continued until his death. Toward the close of his life his philosophy began to attract popular attention, and Schopenhauer eagerly received the admiration and recognition of a circle of devoted disciples. His old age was the most happy and serene period of his life, though his estimate of his own work was so high that it was not possible to satisfy his demands for recognition and adulation.

Schopenhauer maintains that philosophy cannot be a science; that is, a body of truths derived through logical processes and open to anyone to learn with more or less trouble; but true philosophy is art, a revelation dependent on the intuitive insight of the man of genius. As in the case of a picture or musical composition, one will only perceive in a system of philosophy what one has the capacity to perceive. "There is no one philosophy," says Schopenhauer, "existing or acceptable for everybody. The difference in grades of intelligence is too great for that. The true philosophy, when it makes its appearance, will only command the attention of a few heads of the first order." To the circle of men of genius, then, Schopenhauer confidently claims to belong, and he expresses his contempt for the procedure of the savants who vainly seek philosophical truth by logical processes and accumulations of erudition. For Plato and Kant, Schopenhauer has the greatest admiration and his own thoughts are constantly connected with their ideas. In Plato what attracted him especially was the doctrine of an ideal world and its contrast with the unreality of the world of sensible phenomena. Kant maintained the same contrast and Schopenhauer always claims to be the true successor of Kant, although he replaces the latter's table of 12 categories with the single principle of "sufficient reason," which appears in a fourfold form. With regard to Kant's doctrine that we cannot know the true nature of reality, Schopenhauer also differs from his master. Science is, indeed, limited to the world of phenomena. But we can know the nature of reality by a more direct and intimate method than that which science pursues. In the immediate consciousness of myself I know myself as will; this is the side, the true reality of what appears objectively as body. After the analogy with ourselves everything is to be interpreted: in ourselves,

ARTHUR SCHOPENHAUER

we have the key that enables us to understand the world. The universe is in itself will. Like the individual, it has its phenomenal side, which can be known by the objective sciences. But its ultimate nature is will, blind, unconscious striving toward existence. The essence of each thing is found in its will. This essence manifests itself in various ways, and with varying degrees of consciousness, from the unconscious manifestations of inorganic forces like gravitation, to the conscious volitions of men.

Though the will is the ultimate source of reality, it creates for itself an external or phenomenal order. This is the order of the intellect, known in terms of the idea, and appearing as an external order of events in space and time which are connected by the principle of cause and effect. So far as the world of phenomena is concerned Schopenhauer is there in fundamental agreement with Kant. That is the realm of scientific knowledge of law and of intelligibility. But behind this as its source and centre is the reality of the irrational will.

The doctrine that the essence of all things is will, is the basis of Schopenhauer's Pessimism (q.v.), just as Hegel's view that reason is the ultimate ground of all things is the foundation of his optimism. Will, for Schopenhauer, is essentially and radically irrational. Under the concept of will he includes all desires, strivings and impulses, all tendencies to change. These, Schopenhauer declares, are all manifestations of dissatisfaction and pain. Our life itself is essentially painful. Pleasure is merely negative, being nothing but the relief arising from the temporary cessation of our pain and desires. Since the will, both in us and in nature, is irrational in its inmost nature, there is no hope of things becoming better. Pessimism necessarily results from insight into the ultimate nature of things. Schopenhauer dwells with extraordinary eloquence on the unspeakable misery of life and upon the aimless striving and irrationality that is everywhere manifested in the world process. But yet, in a way, this insight into the worthlessness of existence brings with it a means of escape. Relief is possible only when the will is stilled and the desires and appetites are silent. Such redemption one can attain in the contemplation of works of art or in listening to music. In this artistic enjoyment our wants cease to exist, the attitude of will is canceled. This relief, from its very nature, can only be transitory. Final redemption from the will must come through ethics. We must perceive that all willing is vain and pleasure unattainable, and also that since individual existence is untrue and only phenomenal, all individuals are at bottom identical in essence, that is, all are manifestations of the one world will. This is to some extent effected through sympathy. There is, however, a higher and more complete virtue than sympathy. It is found in the complete negation of the individual will, the denial of the will to live, based on insight into the nothingness of finite existence. Of this negation of the will we have examples in Christian and Oriental asceticism. This denial of the will is holiness and blessedness in one. It is from the point of view of knowledge Nirvana,

nothingness, yet in it the soul finds its highest peace and truest reality.

Bibliography.—A complete edition of Schopenhauer's works, edited by Frauenstadt, appeared in 6 vols. (1873-74; 2d ed., 1877); by J. Giseback (1890); and by Steiner in 13 vols. (1894). His 'Fourfold Root of the Principle of Sufficient Reason' is translated by Hillebrand in the Bohn Library (1894), together with his essay, 'On the Will in Nature.' 'The World as Will and Idea' has been translated by Haldane and Kemp (3 vols., 1884-86). 'The Two Fundamental Problems of Ethics,' translation in Bohn Library by B. Bax; 'The Art of Controversy,' translated by Saunders (1896). Consult also Zimmer, 'Schopenhauer, His Life and Philosophy' (1876); Wallace, 'Life of Arthur Schopenhauer' (1896); Caldwell, 'Schopenhauer's System in Its Philosophical Significance' (1896); Fischer, Kuno, 'Arthur Schopenhauer' (1893); Sully, 'Pessimism' (2d ed., 1891); Ribot, 'La philosophie de Schopenhauer' (1874).

JAMES E. CREIGHTON,

Professor of Philosophy, Cornell University.

SCHOULER, skoo'ler, James, American lawyer and historian: b. Arlington, Mass., 3 March 1839. He was graduated from Harvard in 1859, admitted to the bar in 1862 and built up a large practice which he was obliged to give up in 1870 because of deafness, caused by service in the Civil War. He then devoted himself to literature almost exclusively until 1884 when he engaged successfully as a lecturer. He has since been lecturer and professor at the Boston University Law School and at the National University Law School at Washington and in 1891 was appointed lecturer on constitutional law and history at Johns Hopkins. His publications include 'The Law of Domestic Relations' (1870); 'The Law of Bailments'; 'The Law of Personal Property'; 'The Law of Husband and Wife'; 'Eighty Years of Union' (1904); 'Executors and Administrators' (1883); 'Wills' (1887); 'History of the United States under the Constitution, 1783-1877' (7 vols., 1880-1913); 'Life of Thomas Jefferson' (1897); 'Alexander Hamilton' (1901); 'Americans of 1776' (1906); 'Ideals of the Republic' (1908).

SCHOUTEN, show'ten, Willem Cornelis, Dutch navigator: b. Hoorn, 1567; d. Madagascar, 1625. For several years previous to 1610 he was in the employ of the Dutch East India Company. He then determined to discover a new route to the Indies and with Isaac Lemaire of Hoorn began the formation of a company with 200,000 florins capital, Schouten's share being one-eighth. He sailed in command of an expedition, 14 June 1615, was the first to round the cape which he called Cape Horn and crossed the Pacific to Batavia. Here he was arrested for infringement of the East India Company's privileges; but on his return was acquitted, while the company was fined. He discovered Schouten Island on the northern coast of New Guinea.

SCHRADER, shrä'der, Frederick Franklin, American journalist and dramatist, son of an American citizen: b. Hamburg, Germany, 27 Oct. 1857. Author of plays, 'The Man from Texas,' 'The Modern Lady Godiva,' 'At the

French Ball,' 'Nicolette,' comic opera, music by Irenée Bergé, translated into Bohemian and produced in New York, 25 Dec. 1915; 'Corsica,' music drama in one act, music by Irenée Bergé, produced in 1910; lyricist of 'Baron Trenck,' produced in London 1911 and New York 1912. Translator of Max Nordau's, 'Freie Liebe' ('Paris Sketches'), and 'José,' novel, by Otto Ruppius. Assistant and Acting Secretary, Republican Congressional Committee, 1896-1900; author of Republican Text Book 1898. Dramatic editor *Washington Post* 1901-06; on literary staff, David Belasco 1906-09; dramatic editor *New York Globe*, 1909-10; editor *New York Dramatic Mirror* and president publishing company, 19 Aug. 1912 to 9 Sept. 1916. Co-founder with George S. Viereck of *The Fatherland*, August 1914, and for some time associate editor and now editor of *Issues and Events*.

SCHRADER, Julius, German painter: b. Berlin, 16 June 1815; d. Lichterfelde, 16 Feb. 1900. He studied at the Berlin Academy and at Düsseldorf under Schadow, 1837-45. Subsequently he traveled in Italy, England, Holland and Belgium and in the last country fell under the influence of the colorists Gallait and Biefoe. In 1851 he became professor at the Berlin Academy. Among his chief works are 'Surrender of Calais to Edward III' (1847); 'Frederick the Great after the Battle of Kolin' (1849); 'Death of Leonardo da Vinci' (1851); 'Milton and His Daughters' (1855); Cromwell at the Death-Bed of His Daughter' (1859). In fresco he painted 'First Twelve Christian Monarchs' in the Royal Chapel, and 'Consecration of the Church of Saint Sophia, Constantinople' in the New Museum, Berlin. Among his portraits are those of Humboldt and Ranke, the historian.

SCHREIBER, shrī'bēr, Sir Collingwood, Canadian railway engineer: b. Essex, England, 14 Dec. 1831. He settled in Canada in 1852 and engaged in engineering practice at Toronto. He was assistant engineer of the Toronto and Hamilton Railway in 1852-56; superintending engineer of the Northern Railway in 1860-62; division engineer for the Nova Scotia government in 1863-67; and in 1867-73 he had charge of the surveys of the Intercolonial Railway and was chief engineer of the government railways in operation. He was appointed chief engineer of the Canadian Pacific in 1880; became chief engineer and Deputy Minister of the Department of Railways and Canals, Ottawa; and in 1905 he was appointed consulting engineer to the Canadian government and chief engineer of the western division of the National Trans-Continental Railway. He was knighted in 1916.

SCHREINER, shrī'nēr, Olive (better known by name of OLIVE SCHREINER CRONWRIGHT), pseudonym "RALPH IRON," South African author: b. Basutoland, about 1860. In 1883 appeared "Ralph Iron's" first work, 'The Story of an African Farm,' a book of much interest with simple yet forceful pictures, from the Boer country. Further publications are 'Dreams' (5th ed., 1893); 'Dream Life and Real Life' (1893); 'Trooper Peter Halket of Mashonaland' (1897); and 'An English South African's View of the Situation' (1899); a critique on the Transvaal difficulty from the pro-Boer position. She was married in 1894

to S. C. Cronwright with whom she published 'The Political Situation' (1895).

SCHREINER, Oswald, American agricultural chemist: b. Nassau, Germany, 29 May 1875. He was graduated at the Baltimore Polytechnic Institute in 1892, the Maryland College of Pharmacy in 1894, and later studied at Johns Hopkins University and at the University of Wisconsin. He was United States Pharmacopœia Research Fellow in 1895-96, and in 1903 was appointed chemist of the United States Bureau of Soils. From 1906 he was chief of the Division of Soil Fertility Investigation; and in 1914 he was appointed consulting professor of chemistry at the American University. He has prepared many of the bulletins of his department and is also author of 'The Sesquiterpenes' (1904); 'Chemistry of Soil Organic Matter' (1910); 'The Nitrogenous Soil Constituents' (1913), etc.

SCHREYER, shrī'ēr, Adolf, German artist: b. Frankford-on-the-Main, 9 May 1828; d. Kronberg, Prussia, 29 July 1899. He studied at the Stadel Institut, Frankfurt, then at Stuttgart, Munich and Düsseldorf and supplemented this school instruction by wide travels in Europe and the East. In 1862 he became court-painter to the Grand Duke of Mecklenburg-Schwerin. He was a member of the academies of Antwerp and Rotterdam. Before 1870 he lived much at Paris; but after that year lived alternately there and at Kronberg. He was an animal painter, especially choosing the horse for his model and depicting it in vigorous action or, when held in rein, with pawing feet and distended nostril. He was, also, a follower of Fromentian in his love of Eastern subjects, particularly mounted Arabs dressed in brilliantly colored clothes, surrounded by a heated palpitating atmosphere. Some of his pictures are 'Artillery attacked by Prussian Hussars' (1854); 'Wallachian Transportation Train in Rainy Weather,' at Hamburg; 'Charge of Artillery of the Imperial Guard' (1865); 'Horses of the Irregular Cossacks' (1864) at Paris. His 'Battle near Waghensel, in 1849' (1858); 'Battle of Komorn,' 'An Attack of Cavalry,' and 'Prince Thurn and Taxis wounded at Temisvár' are among his best-known pictures, but are lodged in private galleries in Europe. Many canvases by Schreyer are to be found in the private collections of the United States, such as the Walters, the Vanderbilt, the Astor and the Huntington galleries. 'The Watering Place' is at the Corcoran Gallery at Washington.

SCHROEDER, shrē'dēr, Seaton, American rear-admiral: b. Washington, D. C., 17 Aug. 1849. He was graduated at the United States Naval Academy in 1868, and accompanied Commodore Rodgers' expedition against the Korean forts in 1871. He was on special duty supervising the construction of the dynamite cruiser *Vesuvius* in 1888-90, and was in command of that ship in 1890-93. He was executive officer of the *Massachusetts* in 1897-99, and was advanced three points in rank for his services in the Spanish-American War. He was naval governor of the island of Guam and commander of the *Yosemite* in 1900-03; attained rank as rear-admiral in 1908, and was in charge of a division of the Atlantic fleet in 1908-09. From March 1909 until June 1911 he

was commander-in-chief of the Atlantic fleet. He then served on the General Board until 17 Aug. 1911, when he was retired upon reaching the age limit. He was retained on special service with the navy in 1911-14; and in 1917 was appointed hydrographer. Author of many essays and of 'Fall of Maximilian's Empire' (1887).

SCHUBART, shoo'bärt, **Christian Friedrich Daniel**, German poet: b. Obersontheim, Swabia, 26 March 1739; d. Stuttgart, Germany, 10 Oct. 1791. He studied theology at Jena where he lived a dissipated life, and became musical director at Ludwigsburg in 1758, but was banished because of his dissolute conduct. After years of wandering he founded his *Deutsche Chronik* at Augsburg in 1774, but was driven thence in 1777 and removed his *Chronik* to Ulm. He there published a false report of the death of Maria Theresa and was imprisoned for 10 years when he was released at the demand of Frederick the Great in 1787. He then became musical and theatre director in Stuttgart and continued the publication of his paper under the title *Vaterlands-Chronik*. He wrote 'Gedichte aus dem Kerker' (1785); 'Hymnus auf Friedrich den Grossen' (1786), etc. His 'Gesammelte Schrifte und Schicksale' was published in eight volumes (1839-40). Consult Strauss, 'Schubart's Leben in seinen Briefen' (1849).

SCHUBERT, shoo'bërt, **Franz Peter**, Austrian composer: b. Vienna, 31 Jan. 1797; d. there, 19 Nov. 1828. His extraordinary musical gifts were displayed at a very early age, and his talents were so pronounced that his teachers had little else to do but kindle the ever-present though dormant spark.

Before he was 11 years old he was the leading soprano in the Lichtenthal choir, and he also played the violin solos in the services, besides composing songs and pieces for strings and piano. In his 12th year he entered the Imperial Convent, or school for educating choristers for the court chapel. His first piano composition, dated 8 April-1 May 1810, appears to have been a four-hand Fantasia, containing a dozen or more movements. While at the "Convent" he composed his first symphony, in D, in connection with the celebration of the birthday of Dr. Lang, the director of the school. His voice breaking, he returned home about the end of October 1812, in which year his mother died. He then joined his father in school work and for three years taught the primary class. Apart from his school duties he naturally devoted himself to composition, especially in the direction of setting words to music, to which he gave himself up with tremendous enthusiasm. His melodies seemed to be endless, his songs sprang into existence and poets could scarcely write down their verses before Schubert had them set to music. In the intervals snatched from his regular duties he found time to write eight operas, four masses and other sacred works, besides a great number of songs. In 1817 he was enabled to throw off the fetters of his school work through the generosity of his friend Schober. From this time till his death there was only one brief decade, but the number of his compositions during that time is stupendous. He composed with the greatest ease and rapidity,

and it is said that he could readily keep up a conversation while writing even his best pieces. He never hesitated, and seldom revised anything he wrote. His compositions included more than 70 part songs, some 18 works for the stage, 8 sacred pieces, 20 string quartets, 10 symphonies, and 24 pianoforte sonatas, but after all it was not through these that Schubert's name was immortalized, but through his songs, the titles of nearly 500 of which are recorded. They were full of dramatic intensity, poetry and pathos, and full of music of infinite beauty set to long, complex poems, to which he arranged accompaniments of complete fitness and endless variety.

His engagement as teacher of music in the family of Count Esterhazy during the summer of 1818, at Zselész, was the source of his first regular income. There were two daughters in the Esterhazy family, Marie and Caroline, and a little boy of five. The congenial occupation of teaching them was renewed later, in 1824, at which time he composed his 'Grand Duo' (opus 140), full of individualism and truly a symphonic work in its fullest sense. During that summer he also composed his sonata in B flat, the variations in A flat, and a number of other pieces, presumably for use in the musical education of the Count's children.

To attempt to even mention any considerable number of Schubert's compositions here is manifestly impossible, but very complete lists of his works, arranged both alphabetically and also in the order of their composition, may be found in Grove's 'Dictionary of Music.'

One of Schubert's closest friends was Vogl, the tenor, through whose influence the attention of theatrical managers was attracted toward him. He had already written a comic operetta, the 'Zwillingsbrüder,' for the Kärntnerthor theatre, and not long after he was commissioned by a rival theatre to write the music for the 'Zauberharfe,' or 'Magic Harp,' which he is said to have completed in two weeks, and which was first performed on 19 Aug. 1820 in the Theater an-der-Wien. During this year, too, he wrote several of his best songs, including the famous 'Im Walde' or 'Waldesnacht.'

In the following February, when Schubert was entering his 25th year, his talents began to receive recognition, and the publication of his songs was at last within sight. The 'Erl King' was chosen first and was published (on commission) on 1 April 1821, enough money having been subscribed at one of the Gundelhof concerts to defray the cost of printing, engraving, and still leave something over for future publications. Seven more songs (constituting op. 3 and 4) were published on 29 May, op. 5 on 9 July, op. 6 on 23 August and op. 7 on 27 November. The next appeared on 9 May 1822, as "the property of the publishers," who now stopped publication by commission, realizing that they could assume the responsibility without risk.

In August 1821 he began his symphony in E, which, although he did not complete the writing of it, is remarkable for the rapidity with which it was composed. It is said that he probably did not occupy himself with it for more than a few hours, and yet it filled 167 pages. A month or two later he wrote two acts of 'Alfonso and Estrella,' the words being

supplied by Schober. The third act was finished in February 1822, but no public performance of it was given until 26 years after Schubert's death, one cause of this delay being that the original accompaniments proved impossible for a band to play. During 1823 Schubert paid special attention to operatic music but without marked success, perhaps because the librettos were unsuitable. On this point Liszt regarded it as extraordinary that one who had been brought up to love the finest poetry should accept the absurd and impracticable librettos which were offered him, and which resulted in so much of his brilliant music being practically lost to the world. It was in this same year that his famous "Müller-lieder" were composed, consisting of musical settings to Wilhelm Müller's poems, a copy of which he had borrowed from his friend Randhartinger when visiting him.

The rejection of his opera "Pierahras" in 1824 filled him with distress, from which however he was aroused by the quiet joys of his second stay with the family of Count Esterházy at Zselez. During these happy days he probably wrote his lovely string quartet in A minor and the "Divertissement à la Hongroise" for four hands, as well as several other pieces already mentioned.

Some of his best compositions in 1826 were the string quartet in D minor and G, the "Rondeau brillant," as well as the sonata in G major, which Schumann regarded as his "most perfect work both in form and composition." The number of pieces published in that year was very large, showing that a popular demand for his music had arisen, but nevertheless Schubert was always poor, partly because his profits were so small, and partly because he allowed himself to be imposed upon by his friends.

The year of 1827 was notable as the one in which Beethoven died. He and Schubert had not been intimate, and the latter's visit to Beethoven in 1822 had ended disastrously, for on looking over the "Variations" Beethoven had pointed out something which astonished him, whereupon Schubert is said to have lost his self-control and to have rushed from the room. In April of this year was written the beautiful "Nachtgesang im Walde" for four men's voices and four horns, and a spring song for men's voices. In this year he was elected a member of the Musical Society of Vienna, which gave him considerable satisfaction.

The last year of Schubert's life, 1828, was remarkable for the number of his compositions, among which, writes Grove, were "his greatest known symphony (in C), his greatest and longest Mass, his first Oratorio, his finest piece of chamber music, three noble pianoforte sonatas, and some astonishingly fine songs." On 26 March he gave his first evening concert in the hall of the Musik-Verein. The program was very attractive and the applause great. In the month before he died he wrote a new "Benedictus" to one of his Masses, wind-accompaniments to his "Hymn to the Holy Ghost," a long scena for a soprano voice, and a song entitled "Die Taubenpost," which is thought to have been his last composition. He was buried, in accordance with his dying wishes, in the Ortsfriedhof in the village of Währing, and in

a grave only separated by two others from the one which held the remains of Beethoven.

Schubert's most prominent characteristics were truthfulness, honesty, good-humor and a cheerful, contented disposition. With his intimates he was entirely at ease, genial and even boisterous at times, but at a fashionable gathering he was shy and silent. Of his musical genius no better description can be given than in the words of Liszt: "He was the most poetical musician that ever was; and the main characteristics of his music will always be its vivid personality, fullness and poetry. In the case of other great composers, the mechanical skill and ingenuity, the very ease and absence of effort with which many of their effects are produced, or their pieces constructed, is a great element in the pleasure produced by their music. Not so with Schubert. In listening to him one is never betrayed into exclaiming 'how clever'; but very often, 'how poetical, how beautiful how intensely Schubert!'" Consult Ferris, "The Great German Composers" (1878); Kreissle von Heilborn, "Franz Schubert, eine biographische Skizze" (1861-65; Eng. trans. 1869); Reissmann, "Franz Schubert, sein Leben und seine verse" (1873); Barbedette, "Franz Schubert, Sa vie, ses œuvres, son temps" (1866); Frost, "Schubert" (1888).

SCHUCHERT, shū'k'ert, Charles, American paleontologist; b. Cincinnati, Ohio, 3 July 1858. He received a common school education, but possessing a natural aptitude for scientific investigation he early began a collection of fossils and the study of paleontology. He was assistant to different experts in 1885-91; and in 1891-92 assisted in the geological survey of Minnesota. He was preparator of fossils with Dr. C. E. Beecher at Yale in 1892-93; served on the United States Geological Survey in 1893-94; and since 1904 he has been professor of paleontology and Yale professor of the history of geology at Sheffield Scientific School, and curator of the geological collections at Peabody Institute. Author of "Textbook of Geology"; "Historical Geological Paleogeography of North America"; "Revision of Paleozoic Stelleroids, with Special Reference to North American Asteroids" (1915), etc.

SCHULMAN, shoof'man, Samuel, American rabbi; b. Russia, 14 Feb. 1864. He came to America as a child, was graduated at the College of the City of New York in 1885 and studied at the University of Berlin in 1885-89. He was rabbi at Helena, Mont., in 1890-93; at Kansas City, Mo., in 1893-99; and since 1899 has been rabbi of Temple Beth-El, New York. He was a member of the board of editors for the English translation of the Bible for the Synagogue; a contributor to the "Jewish Encyclopedia"; and is author of articles on religious topics.

SCHULTZ, shūltz, Sir John Christian, Canadian administrator; b. Amherstburg, Ontario, 1 Jan. 1840; d. Winnipeg, 13 April 1896. He was educated at Oberlin College, Ohio; Queen's University, Kingston; and at Victoria University, Cobourg, taking his M.D. in 1860. He then engaged in practice at Winnipeg (then Fort Garry), also becoming interested in the fur trade and editing the *Nor'wester*, the first newspaper of the region. He led the Canadian

party at the time of the first Riel Rebellion, 1869-70, was taken prisoner and sentenced to death by Riel. He made his escape, however, and in 1872 became a member of the North West Council. He was a member of the Dominion Parliament in 1871-82; and was a Dominion senator in 1883-88. He was lieutenant-governor of Manitoba in 1888-95. He was actively interested in railway and telegraph development and in colonization; and was for many years a member of the Dominion board of health for Manitoba and the North West Territory. He was knighted in 1895.

SCHULTZE, shoolt sē, **Carl Emil**, American newspaper artist: b. Lexington, Ky., 25 May 1866. He was educated at Lexington and at Cassel, Germany, began drawing for newspapers and under the name of "Bunny" created the popular "Foxy Grandpa" series of comic pictures published since January 1900 in two New York journals. Since 1913 he has been president of the Bunny Amusement Corporation of New York. He is the author of 'Vaudevilles and Other Things' (1900); 'The Adventures of Foxy Grandpa' (1900); 'The Bunny Book' (3 vols.), etc.

SCHULZ, shoalts, **Leo**, American musician: b. Posen, Germany, 28 March 1865. He was educated at Posen, and in the Royal Academic High School of Music in Berlin, came to the United States in 1889, was professor of the New England Conservatory until 1898, was connected with the New York Philharmonic Society in 1890-1906. He published 'Cello Album,' 'Cello Classics' and 'Cello Compositions' (two books each), and author of many unpublished 'cello compositions, songs, orchestral overtures, cantatas, etc.

SCHULZE-DELITZSCH, shoolt'sē-dā'-lich, **Hermann**, German politician and economist: b. Delitzsch, Prussian Saxony, 29 Aug. 1808; d. Potsdam, 29 April 1883. After legal courses at Leipzig and Halle, he entered the Prussian public service; but from 1841 devoted his attention to the economic betterment of small farmers and artisans. Among his various activities, the most important was the establishment of the "people's bank" system, inaugurated at Delitzsch. In these banks, the subscribers made small deposits, obtaining proportional credit and dividends; the management being vested in a board composed of subscribers. In 1859 the more than 200 such banks were centrally organized under the direction of Schulze-Delitzsch. At the time of his death there were in Germany alone 3,500 branches with more than \$100,000,000 in deposits; while the system had been extended to Austria, Italy, Belgium and Russia. He published 'Chapters of a German Workingman's Catechism' (1863); 'The Laboring Classes and Associationism in Germany' (2d ed., 1863); 'Money Advance and Credit Associations as People's Banks' (5th ed., 1876). Consult his life by Bernstein (1879).

SCHUMANN, shoo'mān, **Clara Josephine Wieck**, German pianist, wife of Robert Schumann: b. Leipzig, 13 Sept. 1819; d. Frankfort-on-Main, 20 May 1896. She was the daughter of the pianist Frederick Wieck, from whom she received instruction for 15 years and for the first time took part in a public concert in her ninth year. When Paganini appeared at

Leipzig in 1829 he produced a profound impression upon her and her musical genius was developed still further by a tour with her father through the musical centres of Germany and France. While she derived her marvelous technique from her father, she was well grounded in the theory of music by Kupsch and H. Dorn. She was the first to bring Chopin's works into notice and favor with the German public. In 1840 she was married to Robert Schumann (q.v.) and shared his artistic work and European successes until his death in 1856, after which she pursued her public career alone. In 1878 she was appointed teacher in the Conservatory of Frankfort-on-Main, where she met with success in that capacity, and continued to turn out a series of brilliant pupils until 1892. She was equally gifted as a performer, teacher and composer, and among her works at least 40 are in print and comprises songs, a concerto for the piano, a trio for the piano, preludes and fugues. Consult La Mara, 'Musikalische Studienköpfe' (Vol. V); Kohut, 'Friedrich Wieck'; Von Meichsner, 'Friedrich Wieck und seine beiden Töchter.'

SCHUMANN, Robert, German composer: b. Zwickau, Saxony, 8 June 1810; d. Emden, near Bonn, 29 July 1856. His father, who was a bookseller and an author of some note, while not directly assisting him toward a musical career, encouraged him, and endeavored to obtain the services of Von Weber as his instructor. After his father's death, when Robert was 16, he attended the gymnasium at Zwickau, and later the University of Leipzig. At 17 he set a number of his own pieces to music. His academic work had been largely confined to law and philosophy, but at 20 he began serious piano study under Wieck and Heinrich Dorn. An unwisely chosen method, intended to secure independent action of his fingers, resulted in the crippling of one of the fingers of his right hand, which unfitted him for becoming a pianoplayer, and thenceforward he devoted himself to composing. In 1834 he assisted in founding, and until 1844 edited, a musical journal, the *Neue Zeitschrift für Musik*, for advancing the art and emancipating it from old-fashioned methods and from French and Italian influences. Convinced that German art had not yet reached its full development, he thus expressed himself: "Consciously or unconsciously a new and as yet undeveloped school is being founded on the basis of the Beethoven-Schubert romanticism, a school which we may venture to expect will mark a special epoch in the history of art."

In 1833 Schumann occupied himself with studies in composition, and also published his first 'Impromptu' (op. 5). In this year, too, he commenced his 'F minor Sonata' (op. 11), and completed the toccata which he had commenced in 1829. A turning-point was reached in his life in October 1835 when Mendelssohn and he met at a musical gathering at Wieck's. A strong intimacy seems to have grown up between them. Schumann declared that Mendelssohn was the greatest living musician and that he looked to him as a "high mountain-peak." Mendelssohn at first saw in Schumann only the literary man and the art critic, but it is significant that when, in 1843, Mendelssohn established the Leipzig Conservatorium, Schu-

mann was appointed teacher of playing from score. While there he introduced the use of the piano with pedals as a preparation for playing the organ.

Schumann's marriage in 1840 to Clara Wieck, daughter of his old teacher, was apparently a very happy one, and the fact that he soon afterward began to compose love songs does not weaken this belief. At the same time his wife regarded it as her greatest privilege to interpret his compositions faithfully to the public, nor was it long before she became the leading woman pianist of Germany. In the year after his marriage he paid more special attention to symphonic work, composing three entire numbers, only one of which, however—in *B♭*—was published at that time. He also wrote the first movement of the 'Pianoforte Concerto in A minor.' In 1842 Schumann accompanied his wife on a concert tour to Hamburg. The latter proceeded alone from there to Copenhagen, while he returned to Leipzig. Later they visited Bohemia and met Prince Metternich, at whose invitation they went to Vienna. In 1844 they traveled to Russia, Madame Schumann giving concerts in several of the large cities; but Schumann, who loved the quiet of domestic life, was always impatient to return home.

The style of Schumann's compositions underwent a decided change in 1843, the principal work of the year being 'Paradise and the Peri,' for solo voices, chorus and orchestra. It was first performed on 4 December, and was conducted by Schumann in person. He also composed his popular 'Variations' for two pianos (op. 46), and from this time his reputation in Germany was firmly established. Thus encouraged he began in the following year the second of his two most famous choral works consisting of a musical setting to Goethe's 'Faust.' About this time he gave up the editorship of his paper and changed his residence to Dresden, where he at first lived in seclusion on account of his nervous condition, resulting doubtless from overwork. In 1845-46 he composed his 'Studies' and 'Sketches' for the pedal-piano, as well as his famous 'C major Symphony,' first produced by Mendelssohn at the Gewandhaus in Leipzig, 5 Nov. 1846. In Dresden he met Richard Wagner, for whose work he expressed great admiration, but on account of their very different natures they were never in close sympathy. The former was high-spirited and talkative, while Schumann, always reserved, was growing more and more silent. The idea of the improvement of German operatic music, long a favorite subject with Schumann, now led him to write an opera. He chose as his subject the legend of Saint Geneviève, but only after long and irritating delays was the first performance of 'Genoveva' arranged. This took place on 25 June 1850 under Schumann's own direction. The criticisms of this first attempt at dramatic work were on the whole unfavorable, and it is said that he derived far more gratification from the reception accorded to his music of 'Faust.' He also wrote an excellent musical setting for Byron's 'Manfred,' which had its first performance in Weimar 13 June 1852.

While living in Dresden he undertook the direction of the Liedertafel, and in 1848 he established a choral society. Two years later he accepted the position of municipal director

of music at Düsseldorf. Here he had the direction of a vocal organization and an orchestra. His duties were sufficiently light, however, to leave him ample time for social enjoyment, in which he took great pleasure. His generous nature was manifested by his arrangement of a series of concerts, some of which were devoted wholly to the works of other living composers. This was in line with his desire to aid in advancing the interests of those less famous than himself. As a conductor Schumann was not regarded as a success. His lack of presence of mind and of sympathy with the players was conspicuous and contributed largely to his unpopularity as a leader. This unfortunate condition of things, combined with the return of a brain affection, symptoms of which had been first manifested as far back as 1833, at length made it necessary for him to resign his post, which he did in 1853. During his residence in Düsseldorf the number of his compositions was very great, including the celebrated 'E♭ Symphony,' which, it is believed, was intended to convey by musical expression the impressions he received during a visit to Cologne. It was first performed on 6 Feb. 1851, almost exactly three years before that sad day when, in a state of utter mental distraction, he sought to end his life by jumping into the Rhine. He was saved by some boatmen, but unmistakable signs of insanity soon appeared, although for a brief period later his mind became wonderfully calm and clear, and with it returned his old love of work. His mental powers were shattered, however, and the last two years of his life were spent in an asylum at Endenich. He was buried at Bonn. A monument over his grave was unveiled on 2 May 1880.

Schumann's works present a rare combination of passion and tenderness. He did much for the development of piano-playing and his numerous songs reveal the grandeur and depth of his unselfish nature. His compositions consist of orchestral works, vocal works with orchestral accompaniment, choruses, a large number of songs, chamber music and also many pieces for the organ and piano. Striking features of Schumann as a composer are his originality and his cautious approach to the more difficult classes of work. At the outset of his career he chose simple forms, building several together for his longer pieces. From this method, however, resulted no unevenness or inharmoniousness, a fact which bears strong witness to the greatness of his creative abilities. In the composition of songs Schumann must be conceded to take rank with such composers as Schubert and Mendelssohn. As one of his biographers writes: "Schubert shows the greatest wealth of melody, Mendelssohn the most perfect roundness of form; but Schumann is by far the most profoundly and intellectually suggestive."

Until Schumann reached his 30th year he wrote almost entirely for the piano, and his method of treating the instrument must be regarded as strictly original. He followed none of the methods of the older composers, although he was evidently familiar with their work. His earlier compositions strike the hearer as the result of sudden impulses and, therefore, contain much that is apparently at variance with the established laws of art, but this in no wise detracts from, but rather adds

to, the freshness and originality of their conception.

His symphonies are generally regarded as the most important contributions of this class since the time of Beethoven, whom he approached quite nearly at times, and whose works occasionally served as his models. His love for sacred music was developed only a few years before his death. In writing to a friend in 1851 he said: "It must always be the artist's highest aim to apply his powers to sacred music. But in youth we are firmly rooted to the earth by all our joys and sorrows; it is only with advancing age that the branches stretch higher, and so I hope that the period of my higher efforts is no longer distant." Several compositions of this class are recorded, one of the most famous being op. 71, an Advent hymn for solo, chorus and orchestra; op. 93, a motet for men's voices; op. 144, a New Year's hymn for chorus and orchestra; his 'Mass,' op. 147, and a 'Requiem,' op. 148. These, while not counted among his greatest works, were grandly conceived, and with his other compositions must be a lasting monument to his imperishable genius.

A list of Schumann's works may be found in the catalogue of Schuberth and Company (1860-61), while a complete index to all his published compositions was compiled by Alfred Dörffel and was printed as a supplement to the 'Musikalisches Wochenblatt' (Leipzig 1875).

R. I. GEARE,

National Museum, Washington, D. C.

SCHUMAN-HEINK, hînk, **Ernestine**, née **Roessler**, American opera and concert singer: b. Lieben, near Prague, Bohemia, 15 June 1864. She was educated at an Ursuline convent and studied music under Marietta Leclair at Graz. She made her début at Dresden, 13 Oct. 1878, and sang in opera there for four years, afterward singing for many years at Hamburg and Bayreuth, winning a wide reputation for her magnificent contralto voice and splendid acting. She made her London début at Covent Garden, 8 June 1892, repeating her former triumphs, and first appeared before an American audience at the Metropolitan Opera House, New York, in 1898. Since 1908 she has been engaged chiefly in concert work, although she has made occasional appearances at the Metropolitan Opera House and with the Chicago Grand Opera Company. She ranks as the leading contralto of her time. She was thrice married, to Herr Heink in 1883; to Paul Schumann in 1893, and to William Rapp, Jr., in 1905, divorcing him in 1915. She is an American citizen and has for some years made her home in America. During the European War she gave freely of her time and talent in war benefits and the great loan campaigns.

SCHURMAN, -shoor'man, **Jacob Gould**, American educator: b. Freetown, Prince Edward Island, 22 May 1854. He is of a Dutch family which in the 17th century settled in New Holland, now New York, where his grandfather was born. He was educated in the provinces where he gained the Gilchrist Dominion Scholarship in 1875 and studied later at London and Edinburgh universities. He was elected to the Hibbert traveling fellowship in 1878 and spent two years at Heidelberg, Berlin and Göttingen, mainly occupied with the study of

philosophy. In 1880 he became professor of philosophy and English literature at Acadia College, Nova Scotia, and in 1882 removed to a similar post at Dalhousie College. In 1886 he became professor of philosophy at Cornell University and in 1890 was made dean of the Sage School of Philosophy there. In 1892 he was elected to the presidency of the university. He was appointed by President McKinley chairman of the United States Philippine Commission in 1899 and spent the larger part of that year in the Philippine Islands. During the year 1912-13 he was United States Minister to Greece and Montenegro. His published works are 'Kantian Ethics and the Ethics of Evolution' (1881); 'The Ethical Import of Darwinism' (1888); 'Belief in God' (1890); 'Agnosticism and Religion' (1896); 'A Generation of Cornell' (1898); 'Philippine Affairs—A Retrospect and Outlook' (1902). He is also joint author of the 'Report of the Philippine Commission' rendered to Congress in 1900; 'The Balkan Wars—1912-13' (1914); 'Why America is in the War' (1917).

SCHURZ, shoorts; **Carl**, German-American publicist, editor and author: b. Liblar, near Cologne, Prussia, 2 March 1829; d. New York City, 14 May 1906. He studied at the University of Bonn, in 1848 with others published a revolutionary journal, in 1849 escaped to the Palatinate upon the failure of an insurrection which he promoted at Bonn, took part in the defense of Rastadt and upon its surrender fled to Switzerland. In 1850 he returned to Germany, going thence to Scotland and to Paris, where he was a correspondent for the German press, and, after a year in London, came to the United States (1852), where until 1855 he resided in Philadelphia. Having then removed to Madison, Wis., he identified himself with the Republican party, and by his speeches made himself an important factor in determining the German element of the State against slavery. He participated in the Lincoln-Douglas senatorial canvass in Illinois, entered legal practice at Milwaukee, was a member of the National Republican Convention of 1860 and assisted largely in the framing of its platform. During the ensuing campaign he spoke much in both German and English. He was appointed by Lincoln Minister to Spain, but in December 1861 resigned to enter the army, receiving a commission as brigadier-general of volunteers. He distinguished himself at the second Bull Run (Manassas), was promoted major-general, 14 March 1863, commanded a division at Chancellorsville, held temporary command of the 11th corps at Gettysburg and took part at Chattanooga. After the war he returned to professional practice, in 1865-66 was Washington correspondent of the *New York Tribune*, and was made by President Johnson a special commissioner to report on the workings of the Freedmen's Bureau. In 1868 he was temporary chairman of the convention that nominated Grant, whom he actively supported in campaign. In 1869-75 he was senator from Missouri. He vigorously opposed many of the leading measures of the Grant administration, in 1872 helped to organize the "Liberal" party and presided over the Cincinnati convention which nominated Greeley, but in 1876 supported Hayes, by whom he was made Secretary of the Interior. He introduced competitive examinations for posts

in the civil service, and provided for forest protection on public domains. From the close of the administration to 1884 he was editor of the *New York Evening Post*. In the canvasses of 1884, 1888 and 1892 he supported Cleveland. He had been prominently identified with the Civil Service Reform League and later with the Anti-Imperialist League. His speeches and contributions to periodicals were numerous and able. Among his many publications are a volume of 'Speeches' (1861), a 'Life of Clay' (1887), and 'Abraham Lincoln: An Essay' (1891). A statue of him has been erected on Morningside drive at 116th street, New York City.

SCHUVALOFF, shoo'vā-lōf, **Peter Andreievitch**, COUNT, Russian diplomat: b. Saint Petersburg, Russia, 15 July 1827; d. there, 22 March 1889. He early entered the army, rose to the rank of general at 30, was head of a department in the Ministry of the Interior in 1862, governor of the Baltic provinces in 1864-66, and in the latter year was appointed chief of the secret service. He was sent to London in 1873 as Special Ambassador and arranged the marriage between the daughter of Alexander II and the Duke of Edinburgh. In 1878 he was a representative at the Congress of Berlin, where his pacific course cost him his popularity and influence at home, and later as Ambassador to England he was instrumental in preserving friendly relations between Great Britain and Russia after the Russo-Turkish War of 1877-78, but Prince Gartschakoff was displeased with his concessions and recalled him from London, and thereafter he took no part in public affairs.

SCHUYLER, ski'lēr, **Aaron**, American educator: b. Seneca County, N. Y., 7 Feb. 1828; d. Salina, Kan., 1 Feb. 1913. He was educated at Seneca Academy, Ohio, and was its principal, 1851-62. He was professor of mathematics at Baldwin University, Ohio, 1862-75, and president 1875-85, and from 1885 till his death he was professor of mathematics and mental philosophy at Kansas Wesleyan University, Salina. He was author of 'Complete Algebra' (1870; rev. ed., 1883); 'Elements of Geometry' (1876); 'Higher Arithmetic' (1877); 'Empirical and Rational Psychology' (1882); 'Outlines of Psychology' (1893); 'Systems of Ethics' (1902), etc.

SCHUYLER, Eugene, American diplomat: b. Ithaca, N. Y., 26 Feb. 1840; d. Cairo, Egypt, 18 July 1890. He was graduated at Yale in 1859 and at Columbia Law School in 1863. After practising law he entered the diplomatic service in 1866, was consul at Moscow and Reval and secretary of legation at Saint Petersburg, 1870-76. In 1876 he was transferred to Constantinople and that year, after careful investigations, rendered an important report on the Turkish massacres in Bulgaria. In 1878 he was consul at Birmingham; the next year consul-general at Rome and in 1880 became chargé d'affaires and consul-general at Bucharest. In 1881 the United States government authorized him to arrange and sign the commercial and consular treaties with Rumania and Serbia and in the following year he assumed toward those two countries and Greece the post of Minister-resident and consul-general. In 1889 he became consul-general at Cairo. He published 'Peter

the Great Emperor of Russia' (1884); 'Turkistan: Notes of a Journey in Russian Turkistan, Khokand, Bokhara and Kuldja' (1876); 'American Diplomacy and the Furtherance of Commerce' (1886). He also made translations from Tolstoi and Turgenieff.

SCHUYLER, Louisa Lee, American social worker, great-granddaughter of Gen. Philip Schuyler and of Alexander Hamilton: b. about 1838. She was a member of the United States Sanitary Commission in the Civil War; was one of the organizers and for many years an officer of the New York State Charities Aid Association, founded in 1873; in 1874 originated the first American training school for nurses at Bellevue Hospital against the protest of a considerable share of the management, which grudgingly allotted six wards for its practice field; and in 1907 she was appointed a trustee of the Russell Sage Foundation. She received in 1915 an honorary LL.D. from Columbia University in recognition of her more than 50 years of public service. Author of numerous reports and papers.

SCHUYLER, Montgomery, American journalist: b. Ithaca, N. Y., 19 Aug. 1843; d. New Rochelle, N. Y., 16 July 1914. He was educated at Hobart College, served in the Union army in 1862-63, was on the staff of the *New York World* in 1865-83, *New York Times* in 1883-1907 and *New York Sun* from 1912 till his death. He published 'The Brooklyn Bridge' with W. C. Conant (1883); 'Studies in American Architecture' (1892); 'Westward the Course of Empire' (1906).

SCHUYLER, Philip John, American soldier: b. Albany, N. Y., 20 Nov. 1733; d. there, 18 Nov. 1804. He was the second son of John Schuyler, owner of a large estate near Albany. He served in the French and Indian War in two campaigns (1755-58), first as captain and afterward as commissary with the rank of major. In 1761 he went to England to settle the colonial claims. Returning in 1763 he successfully engaged in the lumber business at Saratoga. He built the first flax mill in America. In 1764 he acted as a boundary commissioner to determine the line between New York and Massachusetts, and later helped settle the New Hampshire boundary. In 1768 he was chosen as Albany's representative in the colonial assembly, where he earnestly defended the side of the colonists. In 1775 he was a delegate to the Continental Congress and served on the committee to frame rules and regulations for the Continental army. He was appointed (19 June 1775) major-general and placed in command of the department of northern New York, with headquarters at Albany. He planned to invade Canada and proceeded as far as Lake Champlain, where he left Gen. Richard Montgomery in command of Fort Ticonderoga, while he returned to Albany to raise more troops and forward supplies. Early in 1776 he led an expedition to Johnstown, N. Y., where he captured the military stores of the British. Owing to a clash with Gen. Horatio Gates he offered his resignation (14 Sept. 1776), which Congress would not accept. In 1777 he was appointed chief of the Pennsylvania militia, and in June was again placed in command in northern New York. On 4 July 1777 Ticonderoga was evacuated by Gen.

Arthur Saint Clair, and later General Schuyler was tried by court-martial for alleged neglect of duty in permitting its capture. He was acquitted and completely vindicated. On 29 July 1777, he evacuated Fort Edward and retreated down the Mohawk Valley before Burgoyne. Notwithstanding the patriot success at Bennington (16 August), he was superseded by Gates (19 August), yet he remained with the army and to him belongs credit of effecting Burgoyne's surrender (19 October). He was again a delegate to the Continental Congress (1778-81) and his counsels were often sought by Washington. As president of the board of Indian commissioners he visited the tribes of the Six Nations and made treaties that secured their neutrality. He was a member of the New York senate (1780-84, 1786-90 and 1792-97) and actively promoted the building of a canal between the Hudson and Lake Erie. He was United States senator from New York (1789-91 and 1797-98). He resigned because of ill-health. He was married (17 Sept. 1755) to Catharine Van Rensselaer and had 11 children. His daughter Elizabeth became the wife of Alexander Hamilton. Consult Lossing, 'Life and Times of Philip Schuyler' (1860-62; 2d ed., 1872-73); Tuckerman, 'Life of General Philip Schuyler' (1904).

SCHUYLERVILLE, ski'ler-vil, N. Y., village, Saratoga County, on the Hudson River, and on the Fitchburg Railroad, about 10 miles east of Saratoga Springs, and 35 miles north of Albany. It was named in honor of Philip Schuyler (q.v.) who planned the campaign against Burgoyne. The village is in an agricultural region, and has a number of industries connected with farm and dairy products. It is a favorite summer resort; and many tourists visit the village on account of its historical associations. A tablet on one of the business blocks gives the information that near is the place where Burgoyne surrendered to Gates. A half mile up the slope from the main street stands the Saratoga Battle monument, erected by the Saratoga Battle Monument Association. The corner stone was laid on the 100th anniversary of the Burgoyne surrender, 17 Oct. 1877. It is ornamented on each side of its four fronts by niches, three of them containing bronze statues of Generals Schuyler, Gates and Morgan. The south niche, where would have been placed the statue of Benedict Arnold, stands empty. All roads from Schuylerville seem to lead to battlefields whereon were fought and won the independence of the republic.

SCHUYLKILL, skool'kil (from the Dutch, meaning "hidden channel"), a river in Pennsylvania, which has its rise in Schuylkill County, flows southeast and enters the Delaware River at Philadelphia. The total length is about 125 miles. In 1816-25 the river was made navigable for freight boats to Port Carbon, three miles above Pottsville (q.v.). Philadelphia obtains from the Schuylkill a large part of the city water supply. The river furnishes considerable water power which is used for manufacturing at Pottsville, Reading, Norristown and other places on its banks, and also at Philadelphia.

SCHUYLKILL HAVEN, Pa., borough in Schuylkill County, on the river of the same name, 25 miles northwest of Reading, on the

Pennsylvania, the Philadelphia and Reading and the Lehigh Valley railroads. It is situated in a coal minging region, and is an important coal-shipping point, having a coal storage yard of a million tons' capacity. There are rolling mills, railroad car shops, pipe mills and manufactures of underwear, hosiery, shoes, soap, paper boxes and flour. Pop. 4,747.

SCHWAB, shwāb, **Charles M.**, American financier: b. Williamsburg, Pa., 18 April 1862. He was educated at Saint Francis College, Loretta, Pa., entered the service of the Carnegie Company as a stake driver in the engineering corps of the Edgar Thompson Steel Works, and became chief engineer and assistant manager in 1881. He was superintendent of the Homestead Steel Works in 1887-89; president of the Carnegie Steel Company in 1897-1901; and president of the United Steel Corporation in 1901-03. He is chairman of the board of the Bethlehem Steel Company and of the Bethlehem Steel Corporation, and director in many trust and manufacturing companies. He was appointed director-general of shipbuilding of the United States Shipping Board Emergency Fleet Corporation, 28 April 1918, and earned high approbation for the energy and ability with which he handled its affairs.

SCHWAB, John Christopher, American political economist: b. New York, 1 April 1865; d. New Haven, Conn., 12 Jan. 1916. He was graduated from Yale in 1886 and later studied at the universities of Berlin and Göttingen. He was instructor, assistant professor and professor of political economy at Yale in 1890-1905, editor of the *Yale Review* from 1892 and librarian from 1905. He published 'History of New York Property Tax' (1890); 'The Confederate States of America' (1901), etc.

SCHWANN, shvān, **Theodor**, originator of the cell theory: b. Neuss, 7 Dec. 1810; d. Cologne, 14 Jan. 1882. He was educated in philosophy and medicine at Bonn, Würzburg and Berlin. From 1834 to 1839 he was the assistant of Johannes Müller (q.v.). While occupying this position he discovered pepsin (q.v.), and published numerous important researches on artificial digestion, on the transmission of nerve-impulses, on the law of muscular contraction, on the walls of the capillaries, on decomposition and fermentation, on procreation, etc. In 1838 Schwann became professor of anatomy at Louvain, and in 1848 at Liège. In 1858 he was also appointed to the chair of physiology. His 'Mikroskopische untersuchungen über die Ubereinstimmung in der Struktur und dem Wachstum der Tiere und der Pflanzen' (Berlin 1839) marks an epoch in biology. Here he points out that both animals and plants are made up of elementary units, the cells (q.v.). This book was translated into English in 1847 by Henry Smith under the title, 'Microscopical Researches into the Accordance of the Structure and Growth of Animals and Plants.' Schwann also wrote the article 'Anatomie du corps humain' in the 'Encyclopedie populaire' (Brussels 1855).

SCHWANTHALER, shvān'tā'lēr, **Ludwig von**, German sculptor: b. Munich, 26 Aug. 1802; d. there, 28 Nov. 1848. He attended the Art Academy at Munich, and was a pupil of the battle painter Albrecht Adam; but in 1821

took up his father's profession of sculpture and at once received a commission from King Maximilian to furnish a model for a silver épergne decorated with incidents from the fable of Prometheus. After a year's travel in Italy (1827) he executed the figures for the Ægina Gallery of the Glyptothek at Munich, and other decorative work for the same building. His 'Shakespeare' in the vestibule of the theatre in his native city belongs to this period, as does the Bacchus frieze in the ballroom in the palace of Duke Max. On being appointed professor in the Art Academy at Munich he soon gathered a great number of pupils about him. He was meanwhile busy in numerous important works; a frieze illustrating the 'Voyage of the Argonauts'; a statue, 'Poetry of Hesiod'; the reliefs illustrative of Pindar; the statues of Æschylus, Sophocles and Aristophanes; the reliefs illustrating the myth of Aphrodite. Of his monumental work in marble and bronze, are the pediment groups in the Walhalla, consisting of 15 statues illustrating the 'Victory of Arminius over Varus'; and the two pediment groups for the Munich propylæum. The greatest, however, of his works of this class is the figure of 'Bavaria,' more than 20 feet in height, for the Hall of Fame in Munich. He also executed many statues of notable individuals. Among his ideal works are the life-size figures in sandstone of 'Venus'; 'Diana'; 'Vesta and Ceres'; 'Apollo'; 'Eros'; 'Bacchus'; and 'Pan.' This series was completed in 1840 for the castle of Wiesbaden. His 'Dancing Girl,' a life-size figure in white marble is a work of remarkable beauty. His 'Shield of Hercules,' begun at Rome, is conceived in the pure classic spirit. It illustrates, after Hesiod, that divinity's exploits, etc., in 140 figures; has been cast in bronze, and replicas are to be found both in Germany and England. He was a sculptor of the Romantic school and his works did much to promote the cause of Romanticism, an art cause which lost much by his death. While several of his works exhibit great spontaneity, sometimes he overelaborates to such a degree as to impair the force of his original conception.

SCHWARTZ, shvārts, **Christian Friedrich**, German Protestant missionary: b. Sonnenburg, Prussia, 26 Oct. 1726; d. Tanjore, India, 13 Feb. 1798. He was educated at the University of Halle, 1746-49, ordained at Copenhagen and sailed from London for India 1750. He was stationed at Tranquebar, a Danish mission, until 1766, when, having transferred himself to the English Society for Promoting Christian Knowledge, he removed to Trichinopoly and founded a church and a school. He removed to Tanjore, in 1778, and went as an ambassador to negotiate peace with Hyder Ali, at Seringapatam, in which he was successful after all others had failed. In a later war he succeeded in saving the city of Tanjore from famine by his influence with the peasants, whom he induced to send supplies. He gained the friendship of the rajah of Tanjore and of Hyder Ali, and the former, on his deathbed, entrusted his son and successor to the missionary's care. A monument designed by Flaxman and erected at Tanjore commemorates the young rajah's gratitude for his tutor, while another at Madras testifies to the general ap-

preciation of the services of Schwartz in India. Consult Pearson, 'Memoirs of the Life and Correspondence of C. F. Schwartz' (1833).

SCHWARTZITE, a mercury-copper ore worked in Sumer district, Baker County, Ore.

SCHWARZ, Berthold, a Franciscan friar of Freiburg or Dordmund: d. Venice, 1384. His real name was Constantin Anklitzen: Berthold was his monastic name, and the epithet Schwartz, "black," was added to it, because of his addiction to the study of chemistry, in the course of which he is supposed to have discovered an explosive, formed by the combination of saltpetre, sulphur and quicksilver; or of saltpetre, sulphur, lead and oil. Thus he is sometimes credited with the invention of gunpowder. This is said to have taken place in the early part of the 14th century. Schwarz, whether the inventor of gunpowder or not, was undoubtedly the inventor of artillery. In 1380 he came to Venice, and was commissioned by the government to cast some cannons, which are described as of an enormous size. The price agreed upon for his work not being forthcoming he became importunate, and was rewarded by being cast into prison, where he died. In 1853 a statue was erected to him in Freiburg. Consult Hansjakob, 'Der schwarze Berthold, der Erfinder des Schiesspulvers' (1891). See GUNPOWDER.

SCHWARZENBERG, shvārt'sēn-bērg, **Adam of**, Franconian count: b. 1587; d. Spandau, Prussia, 17 March 1641. He was descended from one of the oldest families of Franconia, was Prime Minister to George-Wilhelm, the Elector of Brandenburg, was all-powerful during the Thirty Years' War, and caused great calamities to the electorate of Brandenburg through his promoting an alliance with Austria against the Swedish Protestant League. When the "Great Elector" assumed the reins of government in 1640 he punished Schwarzenberg by divesting him of his power and imprisoning him in the fortress of Spandau, where he died.

SCHWARZENBERG, Karl Phillip of, Franconian prince and soldier: b. Vienna, Austria, 15 April 1771; d. Leipzig, Germany, 15 Oct. 1820. He received a military training and served with distinction in the battles of Wagram, Hohenlinden and Ulm, and after the Peace of Vienna 1809, was Austrian Ambassador to Paris, where he is said to have arranged the marriage between Maria Louisa and Napoleon. At Napoleon's request he was created a field-marshal and, in 1813, placed at the head of the Austrian army of observation in Bohemia. When Austria joined Russia and Prussia, Prince Schwarzenberg commanded the allied forces, gained the battle of Leipzig and led the victorious armies into Paris 1813. Consult Prokesch-Osten, 'Denkwürdigkeiten aus dem Leben des Feldmarshalls Fürsten Schwarzenberg' (1882).

SCHWATKA, shwāt'ka, **Frederick**, American Arctic explorer: b. Galena, Ill., 29 Sept. 1849; d. Portland, Ore., 2 Nov. 1892. He was graduated at West Point in 1871, served as second lieutenant, United States army, until 1878, when he obtained leave of absence, and headed an expedition to King William's Land, in search of records and remains of Sir John Franklin's Arctic exploring party. He was successful and

brought back in 1880 some valuable geographical information as well as the buried records, then having made a sledge journey of 3,251 miles, the longest on record. Schwatka next explored the Yukon River in Alaska, and returning in 1884, resigned his army commission, having meantime been promoted to first lieutenant. He led three other exploring expeditions: one to Mount Saint Elias, which he ascended for 7,200 feet, for the *New York Times* in 1886; one in 1891 to Alaska, opening up some 700 miles of new territory; one in 1889 to Chihuahua in Mexico, for the journal *America*. He was the recipient of the Roquette Arctic medal from the Paris Geographical Society, of a medal from the Imperial Geographical Society of Russia and of honors from geographical societies of Rome, Berlin and Geneva. He was the author of 'Along Alaska's Great River' (1885); 'Nimrod in the North' (1885); 'The Children of the Cold' (1886). Consult Gilder's 'Schwatka's Search' (1881).

SCHWEINFURTH, shvin'foort, **Georg August**, German explorer and botanist: b. Riga, 29 Dec. 1836. He was educated at Heidelberg, Munich and Berlin, specializing in botany, and in 1863-66 explored the valley of the Nile and the African Coast of the Red Sea; in 1869-71, aided by the Royal Academy of Sciences of Berlin, he explored equatorial Africa in the countries of the Bongo, Madi, Dinka and other peoples, and discovered a tribe of pigmies and the river Welle. He founded the Egyptian Geographical Society 1872, and in 1880 became the director of all the Egyptian collections in Cairo. In other explorations he investigated the oasis of El-Chargeh; the botany of various districts of Egypt; the southern portion of Arabia, and Helouan and the Italian colony of Erythrea. His publications chiefly relate to travel and botany, and include 'Plantæ quædam Niloticæ' (1862); 'Beitrag zur Flora Æthiopiæ' (1867); 'Reliquiæ Kotschyaræ' (1868); 'Im Herzen von Afrika' (1874); 'Artes Africanæ' (1875), etc.

SCHWEINITZ, shvī'nits, **Edmund Alexander, de**, American bishop of the Unity of the Brethren Church, son of L. D. von Schweinitz (q.v.): b. Bethlehem, Pa., 20 March 1825; d. South Bethlehem, Pa., 18 Dec. 1887. He was graduated at the Moravian Theological Seminary at Bethlehem in 1844, and studied at Berlin in 1845. He held various pastorates in 1850-80, and in 1870 was consecrated bishop. His family for more than 100 years was continuously represented in the American branch of the Moravian ministry. He was president of the Theological Seminary at Bethlehem in 1867-84. In 1856 he founded the *Moravian* and edited it in 1856-66. Author of 'Moravian Manual' (1859); 'The Moravian Episcopate' (1865); 'Some of the Fathers of the Moravian Church' (1881); 'History of the Unitas Fratrum' (1885), etc.

SCHWEINITZ, Emil Alexander de, American bacteriologist: b. Salem, N. C., 18 Jan. 1866; d. Washington, D. C., 15 Feb. 1904. He was graduated from the University of North Carolina in 1882, subsequently studying at Göttingen and taking a medical degree at

Columbian University, Washington. He was dean and professor at the Columbian Medical School and director of the biochemic laboratory of the Department of Agriculture at Washington, and made many original investigations in regard to bacteria, tuberculosis, disinfectants and hygienic problems. The results of these investigations appeared in numerous published scientific papers.

SCHWEINITZ, George Edmund de, American ophthalmologist, son of Edmund A. de Schweinitz (q.v.): b. Philadelphia, Pa., 26 Oct. 1858. He was graduated at the Moravian College in 1876 and took his M.D. at the University of Pennsylvania in 1881. He was professor of ophthalmology at the University of Pennsylvania from 1902; and was consulting ophthalmologist at the Philadelphia Hospital and consultant at the Philadelphia Polyclinic. He was for many years first lieutenant in the United States army medical reserve corps and was promoted major in 1917. He was coeditor of the 'Ophthalmic Year Book' (1905-09), and author of 'Diseases of the Ear' (8th ed., 1916); 'Toxic Amblyopias' (1896); 'Diseases of the Eye, Ear, Nose and Throat' (1899), etc.

SCHWEINITZ, Louis David von, American Moravian clergyman and botanist: b. Bethlehem, Pa., 13 Feb. 1770; d. there, 8 Feb. 1834. He was educated in Germany, entered the Moravian ministry and in 1812 returned to America as the general agent of the Moravian Church in the United States. He afterward filled other important offices in the Church both at Salem, N. C., and at Bethlehem. He was an enthusiastic botanist and added 1,400 new specimens to the catalogue of American flora. He devoted himself particularly to the study of American fungi, which had hitherto received scant attention. At his death he possessed the largest private collection of plants in America, and this he willed to the Philadelphia Academy of Natural Science. Author of 'Conspectus Fungorum Carolinæ' (1818); 'Synopsis Fungorum in America Boreali Media Degentium' (1832), etc.

SCHWEINITZ, Rudolf, German sculptor: b. Charlottenburg, 15 Jan. 1839; d. Berlin, 8 Jan. 1896. He was a pupil of the Berlin Academy and of Schiövelbein, took a prominent part in the decoration of the National Gallery at Berlin and executed numerous commissions for monuments, public works and official buildings. Among his works were many busts, such as those of Crown Prince Frederick William (1872) and William I (1882) in marble. The memorial of William I and Frederick III at Fürstenwalde is also by him, as are also 20 decorative statues for the equestrian memorial of Frederick William III at Cologne.

SCHWENKFELD, shvĕnk'fĕlt, **Kaspar von**, German mystic and religious leader: b. Ossig, Silesia, 1490; d. Ulm, 10 Dec. 1561. He studied at Cologne and other universities, in 1516 entered the service of the Duke of Liegnitz, and was made a councillor. A learned scholar, he differed from Luther on several points of theology, and was thus opposed by both Catholics and Protestants. His writings are of interest in the study of the times of the Reformation. Those who adhered to his views were subjected to greater or less persecution and in 1734 many emigrated to Pennsylvania,

where they settled in Montgomery and adjacent counties. There they maintain a few small churches, the doctrines, disciples and government of which in many particulars resemble those of the Society of Friends. The Schwenkfelders or Schwenkfeldians have sometimes been erroneously identified with the Dunkards. Consult Kadelbach, 'Ausführliche Geschichte Kaspar von Schwenkfelds und der Schwenkfelder in Schlesien, der Ober-Lausitz und Amerika' (1861).

SCHWENKFELDIANS, shvĕnk'fĕl-dī-anz. See RELIGIOUS SECTS.

SCHWERIN, shvā-rĕn, Germany, capital of the grand duchy of Mecklenburg-Schwerin, picturesquely situated on the west shore of the Lake of Schwerin, 20 miles south of the Baltic, and 130 miles northwest of Berlin. The lake is 14 miles long and 3 broad, and has smaller lakes behind it. The town is surrounded with handsome suburbs and contains the grand castle (1845-58), a Renaissance structure, erected by Wallenstein on a small island, one of the finest Gothic cathedrals in northern Germany, begun in 1248 and completed in the 15th century, with interesting monuments and stained glass; an arsenal; a museum and picture-gallery, and manufactures lacquered wares, machinery, cloth, tobacco, beer, etc. Pop. about 43,131.

SCHWIND, shvĭnt, Moritz von, Austrian painter: b. Vienna, 21 Jan. 1804; d. Munich, 8 Feb. 1871. He was a pupil of the Vienna and Munich academies, and in 1832-34 decorated a room in the Königsbau with encaustic pictures; in 1834-35 he undertook one of his greatest works, the painting of 60 compositions in water-color for Castle Hohenschwangau; became a professor in the Munich Academy in 1847; in 1854-55 painted the frescoes in Wartburg, and in 1864-67 those in the Vienna Opera House. He was a member of the Berlin, Vienna, Paris and other academies, and was knighted in 1855. He is considered one of the foremost of modern painters and the best representative of German romanticism. He worked as well in fresco, oils or water-colors, and his compositions number several hundreds.

SCHWYZ, shvĭts, Switzerland, capital of the canton of Schwyz, on the Gotthard Railroad, three miles northeast of the Lake of Lucerne. The interesting old town-hall contains the earliest trophies of the Swiss struggles for independence. There are also a handsome church and several higher educational institutions. The chief industries are cotton-spinning and the manufacture of bricks. Fruit and cattle-raising are extensively carried on in the neighborhood. Pop. about 9,000. Schwyz took such a conspicuous and leading part in the revolts against the house of Hapsburg that its name was applied to the whole of the Swiss Confederacy.

SCIACCA, shāk'kā, Italy, a seaport town and bishop's see in Sicily, in the province of Girgenti, 30 miles northwest of Girgenti on a sloping hill. It is badly built; its principal buildings are the cathedral (11th century), some ancient castles, several convents and a technical school and gymnasium. It is the Sicilian headquarters of Mediterranean coral fishing.

There are manufactures of bricks, pottery, barrels, baskets, olive oil and many persons are employed in fish-curing. Pop. about 27,000.

SCIÆNIDÆ, sī-ĕn'ī-dĕ, a family of percomorphous, spiny-rayed teleostomous fishes, somewhat resembling perches, in which the body is usually slightly compressed and elongated and covered with thin, slightly ctenoid scales. The head is scaly and its superficial bones are remarkable for the extensive development in them of passages for the mucous canals. The premaxillary bones are protractile and the chin is provided with pores and sometimes a barbel. Jaw teeth are well developed but, beyond the formation of enlarged canines, are not differentiated, but large molar teeth may pave the pharyngeal bones. The fins are well developed, the soft dorsal long, the caudal usually rounded or truncate and the anal short and preceded by one or two spines, never more. With few exceptions the air-bladder is large and of complicated structure; and it is by forcing air through this organ that the peculiar grunting and rumbling sounds produced by these fishes are caused. Most of the species are marine and littoral, but a few are fresh-water. Most of them feed upon other fishes but some upon crustaceans and mollusks. The family is an extensive one of 30 genera and about 150 species widely distributed and especially numerous in warm seas, and most of them are good food-fishes, two species, the *Maigre* and the *Bearde dumberina*, being particular favorites for the table. Nearly all of the genera and more than 100 species are recorded as occurring in North American waters, including some food-fishes of first-rate importance and several game-fish. There may be mentioned as belonging here the weakfishes, drums, croakers, kingfish, spot and yellowtail.

SCIATICA, sī-āt'ī-kā, a painful neuritis of the sciatic nerve, which is the chief nerve of the back of the thigh and leg. It is characterized by extreme pain, often excruciating and occurring in paroxysms, and increased by any change of temperature and moisture; there is stiffness and generally swelling of the limb at the beginning of the disease, but after repeated attacks the limb seems to shrink, owing to the wasting of the muscles. In some cases the articulation of the hip seems affected, and permanent immobility of the limb takes place. Mild attacks are often called neuralgia of the sciatic. In all cases very careful examination of the pelvis and the bones of the lower part of the spinal column should be made, and all causes for chronic poisoning sought for. It is a very chronic condition. See NEURALGIA; NEURITIS.

SCIDMORE, skīd'mōr, Eliza Ruhamah, American traveler and author: b. Madison, Wis., 14 Oct. 1856. She became identified with the National Geographic Society at Washington, D. C., in 1890, and later its corresponding and foreign secretary. Her published works include 'Alaska: The Southern Coast and the Sitkan Archipelago' (1885); 'Jinrikisha Days in Japan' (1890); 'Guide to Alaska and the Northwest Coast' (1890); 'Westward to the Far East'; 'From East to West'; 'Java: the Garden of the East' (1897); 'China, the Long-Lived Empire' (1900); 'Winter India' (1903); 'As The Hague Ordains' (1907), etc.

SCIENCE OF LANGUAGE. See LANGUAGE, SCIENCE OF.

SCIENCES, Classification of. The effort to classify systematically the manifoldness of scientific achievements is a part of the methodology of science, and thus ultimately a part of logic. It has attracted the philosophical thinkers from the days of Plato to the present time. It came to the foreground of logical thought especially at those epochs in which new scientific movements started. It was thus mostly much more than a mere dividing and subdividing of the already existing sciences. It was essentially an endeavor to open new perspectives and to show the way to new possibilities of development. The new ordering and grouping of the parts of knowledge was thus always a symptom of great philosophical movements and an expression of deepest energies in productive ages. Only those periods whose scientific thought was lost in specialization without originality neglected the logical task of working out a survey of the whole field.

The principles of classification have changed frequently, and it would be almost artificial to seek a direct continuity in the successive efforts. Essentially psychological are those classifications with which both the classical philosophy and the modern philosophy answer the problem for the first time, inasmuch as both Plato and Bacon group human knowledge in relation to mental faculties. When the Platonists divided all knowledge into dialectics, physics and ethics, the three large parts corresponded to the activity of the reason, to the sensory perception and, thirdly, the desires and impulses. Bacon, also, comes to a three-fold division of human learning, corresponding again to three mental regions. It is memory, imagination and reason which are responsible for the subdivision of the "intellectual globe." The memory gives us history; imagination gives us poetry; and reason furnishes us with philosophy or the sciences. History is divided into Natural History, with its subdivisions of Normal, Abnormal and Artificial Phenomena; and Civil History, with its subdivisions of Political, Literary and Ecclesiastical History. Poetry is to be divided into Parabolic, Dramatic and Narrative. Philosophy, or the sciences, finally refer first to Man, secondly, to Nature, thirdly, to God. The Science of Man is subdivided into Civil Philosophy, with its departments of Intercourse, Business and Government; and on the other side, Philosophy of Humanity, which refers either to the Body, with Medicine, Athletics, etc., or to the Soul with Logic and Ethics. The Science of Nature is Speculative, and as such either Physics or Metaphysics; or it is Applied, and as such either Mechanics or Magic.

This classification of Bacon remained a classic model for more than a century. The French Encyclopædists still stood completely under his influence, and d'Alembert substituted only art in general for poetry, thus continuing the intellectualistic attitude, according to which poetry and art are defined as technical means of communication and expression and thus as parts of the system of knowledge. Yet the onesidedness of every psychological classification was always felt, especially because there is no knowledge which originates from one group of mental functions only. It thus seemed a natural antithesis to refer the sciences not

to their mental origin but to the mental purposes which are to be fulfilled by them. It can be said that such a reference to purpose controls the classification of Aristotle. He combines the Dialectics and Physics of the Platonists into the one group of Sciences with theoretical purpose. A second group is then formed by the Sciences which refer to practical ends of action. And the third group, finally, are the Sciences related to creative activity. The Theoretical Sciences are divided into Analytic, Metaphysics and Physics; the Practical Sciences into Ethics and Politics; the Creative Sciences into Art and Technics. In a similar way, Locke, too, adjusts the divisions of knowledge to three groups of purposes. The first end of Knowledge is a theoretical understanding; the second purpose is the good and the useful; and the third is the development of Science in the interest of the understanding. He comes thus to the separation of Physics, Ethics and Logic, defining Logic as a nominalistic science.

The progress of natural science, with its important efforts of classification in descriptive botany and zoology suggested in the meantime more and more a classification of all knowledge with reference to the various groups of objects. Of course, in the subdivision such grouping with reference to the various things in the universe had always been acknowledged; but complete systems of classification of this type were now worked out from various sides. Both the physicist Ampère and sociologist Bentham, for instance, start thus from the difference of physical and mental phenomena, the one dividing all sciences into Cosmology and Noology, the other into Somatology and Pneumatology. Their further classifications elaborate a complex system in which partly theoretical, partly practical, principles are influential. Their fundamental division corresponds in a certain way to the two large classes with which in our present time the unphilosophical efforts of popular science are usually satisfied. Popular sciences prefer, indeed, to-day mostly to group all knowledge with reference to the material and, accordingly, to work with a classification which begins with a separation of physical and mental facts. The physical facts are then subdivided with reference to the different classes of objects and the mental facts of the individual and of society with regard to the different groups of mental interests.

Yet the classification with reference to mental faculties, practical purposes or groups of material are not the only ones which have become influential in the development of thought. Even a naturalistic age could not overlook the fact that, after all, the different sciences do not really deal with different objects, but more often with different aspects of the same object. Man himself, for instance, can play a rôle in a large variety of sciences which do not belong together at all. These various aspects which interest the different sciences are, however, not simply co-ordinated; otherwise they would be unfit to constitute a systematic order. Comte recognized that they were dependent upon each other, and thus he created a system in which the fundamental sciences were conceived in one straight line of logical order. If each member of the series really demands the foregoing as its presupposition, it is a necessary

consequence to see with Comte in this logical order at the same time the historical order of the sciences. The latest and most complex group of knowledge is that which he called Sociology, which contains practically all the knowledge of history and civilization, all the mental and moral facts as far as they enter into a system of positive knowledge at all. But this whole social life presupposes the understanding of man as an organism. The science of sociology is thus dependent upon the science of biology. But the biologist, again, tries to bring back his facts to the laws of chemistry, which he presupposes, and so forth. The one-dimensional system of Comte thus begins logically with a most general type, with mathematics, and goes from that to astronomy, from that to physics, then to chemistry, then to biology and finally to sociology. Spencer's system is essentially an elaboration of Comte's. He, too, begins with the most abstract science, mathematics; progress is then to the abstract concrete sciences which deal with the general forces of the universe, mechanics, physics and chemistry for which mathematics is the presupposition, and thence to the concrete sciences which refer to single objects; that is, to astronomy, geology and biology, while psychology and sociology become special parts of biology. The shortcomings of all these efforts are evident as soon as we consider that such positivistic systems crowd the totality of mental and moral sciences and all that refers to history and civilization under the conception of sociology. That means, of course, a strictly naturalistic aspect of the history of culture. All that the inner civilization of mankind has produced, politics and law, literature and art, knowledge and religion and philosophy, become then nothing but functions of the biological organism; and yet everyone who takes the standpoint of the historian or jurist, of the philosopher or theologian, feels the artificiality of such a naturalistic standpoint for these disciplines. The principle of grouping the sciences with reference to their logical relation is, however, in itself, of course, not responsible for this artificiality and for this unfairness to the historical and cultural disciplines. It was the materialistic metaphysics of those positivistic systems which brought about this overweight of natural science. On idealistic ground the reference to logical relations yielded accordingly a system of very different type. In Hegel's philosophical system, for instance, the sciences are brought, too, into logical relations with fullest justice to the demands of the moral sciences.

But while the Hegelian system has lost its influence in our day through its speculative character, our time is, in its deeper thought, strongly influenced by a newer movement which again brings order into the intellectual globe by insisting on logical differences which had been neglected too long a time. This movement, starting with Windelband, considers as the more essential difference between the various special sciences whether the logical aim is to find laws or to understand the individual objects. When Spencer separates those more abstract sciences of the physical and chemical energies from the sciences of the concrete individual object, it is a matter of course for him that these sciences of individual objects have to overcome the concrete individuality and have

to find general laws which hold for all the concrete objects of that special group. This newer school, on the other hand, insists that there are sciences which on principle do not want to find laws and are not interested in generalities, but seek to understand and to interpret the concrete objects just in their individuality. All the historical sciences then belong to this group as against the natural sciences which seek the abstract laws. It is evident that this division has again nothing to do with the separation of the different kinds of objects, as any kind of material may be considered from both standpoints. Any process may be on the one side considered as a special case of a general law, interesting thus only in so far as it allows the recognition of any law in it, and, on the other hand, it may be considered in its incommensurable individuality. As a matter of course from such a logical standpoint mental life, too, allows both ways of consideration, and enters thus on the one side, into the law-seeking naturalistic sciences, on the other side, into the historical sciences which seek the unique individuality. Psychology would be the natural science of the mental phenomena.

It can be said that these various motives which have alternated in the classification of science are all still influential to-day, partly as after effects of historical movements like those of Comte and Spencer or Fichte and Hegel, partly as results of conditions which ever again repeat themselves. Especially the different emphasis on different sciences must lead always anew to different methods of grouping. The philosopher, the physicist, the historian, the psychologist insist instinctively on different schemes of classification, the one perhaps influenced by the manifoldness of material, the other by the manifoldness of method or by the variety of purpose; the one anxious to draw sharp demarcation lines between the different fields and thus taking care for an exact logical relation, the other much more anxious to express and to favor in his system the manifoldness of interrelation between the various parts of human knowledge and science. It is thus hardly possible to sketch a classification of sciences which would find general agreement and which would be in principle independent of a particular philosophical standpoint. Yet it may be possible to characterize at least certain chief tendencies which can be recognized in the scientific life of our time and which express themselves in the practical division of scientific labor, for instance, in the organization of the higher institutions of learning.

The largest division of knowledge may be that which separates the Theoretical Sciences and the Practical Sciences. It cannot be denied that even this separation offers logical problems. On the one side it has been said that the so-called Practical Sciences, for instance, those of the engineer or of the physician, of the lawyer or of the minister, of the diplomat or of the teacher, are after all theoretical as far as their really scientific content is concerned, while that element in them which makes them practical is an art and not knowledge. The skill in diagnosing disease or teaching pedagogically, or presenting legal argument, can be imparted by training but cannot be communicated in judgments, while every

science must be a system of judgments. The juristic of theological or technological science, on the other side, seems just as theoretical as history or mathematics. While in this way the knowledge element of the practical sciences would go over into the sphere of the Theoretical Sciences, others have taken the opposite view and have claimed that there is no knowledge but practical knowledge. It is a philosophic doctrine which became popular partly in the sphere of biological thinkers, partly among radical empiricists. They all agree that knowledge is a function of the human organisms which became developed through the practical needs of life. Every science, including all the so-called theoretical ones, thus exist only by their fulfilling certain practical needs of men.

But even if we accept the arguments on both sides, that fundamental division of Theoretical and Practical Science remains justified. The question whether all knowledge serves ultimately practical ends and has its meaning in this relation to practical purposes is an epistemological one; the separation between theoretical and practical sciences, for instance, between physics and engineering, between biology and medicine, is a methodological one. The arguments thus move on different levels. In a philosophical sense every science may be practical; in a logical sense astronomy is strictly theoretical, while the science of bridge-building is not. It is again such logical argument by which we must reject the opinion that all Practical Sciences are ultimately theoretical. Of course, if we were to call theoretical every group of propositions which can be communicated and learned, the science of bridge-building would be just as theoretical as geometry. But the logician has the duty to discriminate between these sciences which consider the facts as such without any relation to our own practical purposes and those other sciences in which the whole grouping of facts, the sifting and combining of the material, is controlled by a practical human end. Medical science is certainly made up of statements which would find their place in a complete theoretical system of the physical world. But in such a concrete description of the processes in the universe the pathological variations of the human organism would play a most insignificant rôle, and a knowledge of the chemical substances which bring harmony again into the organism would be accidental. In the Practical Science of medicine such curing of the diseases becomes a centre of the thought system, and the selection of theoretical facts which are to enter into this science is completely determined by this practical end.

It is thus not even sufficient to characterize the Practical Sciences as applied sciences. The latter expression suggests that the logical difference between the theoretical and practical disciplines is given merely by the fact that the one considers a certain relation theoretically and the other teaches how to apply it. Every Practical Science would thus correspond exactly to a special theoretical science. But the relation is a much more complex one, inasmuch as the Practical Science cannot logically be characterized by the relation to the theoretical starting point, but only by the relation to the practical end. The one end may demand the co-operation of a dozen sciences and one Theoretical Science

may enter as a means into a dozen different Practical Sciences. We have to acknowledge thus for the Practical Sciences a unique and independent logical structure and the system of practical sciences would demand subdivisions which would not correspond at all to the subdivisions of theoretical knowledge. The chief human ends and aims would have to determine the grouping of these practical disciplines. We might separate thus, firstly, the Utilitarian Sciences; secondly, the Sciences of Social Regulation; and thirdly, the Sciences of Social Culture. In the Utilitarian Sciences the practical aim refers to the world of things; it may be the technical mastery of nature, or the treatment of the body, or the production, distribution and consumption of the means of support. Here belong, therefore, also the disciplines which are studied in the institutes of technology and in the medical schools, in the agricultural institutions, and so on. The Sciences of Social Regulation serve those aims which refer to the mutual relations of subjects; they deal with the political, legal and social problems. The Sciences of Social Culture, finally, refer to those aims in which not the individual relations to things or to other subjects are in the foreground, but the purposes of the development of the subjects themselves; education, art and religion here find their place.

On the other side we find, then, the universe of Theoretical Knowledge as it is studied in the collegiate departments and graduate schools of the universities. Inasmuch as the pure theoretical knowledge for Knowledge's sake made up the original meaning of the word Philosophy, the whole of it might be called Philosophical Sciences in the widest sense of the word. This tradition is still alive, for instance, in the German universities, where all Theoretical Sciences are classed together in the Philosophical Faculty as against the Faculties of Law, Medicine and Divinity; and in a corresponding way the American universities confer the Ph.D., that is, doctor of philosophy, on the student of mathematics or history, of languages or natural sciences. In the historical development of scientific work this unity of theoretical knowledge has been replaced by the most complex manifoldness of scholarly endeavors. One part of theoretical knowledge after the other was dismissed from philosophy as soon as it reached a certain independent importance, and yet philosophy in the narrower sense of the word remained in its traditional rôle of furnishing a theoretical view of the world. It was no longer identical with the totality of knowledge, but it fulfils the same purpose by bringing unity into the manifoldness of scattered special sciences, in examining their fundamental conceptions, their relative values, their methods and the position of the whole of knowledge in the system of human purposes. We can divide, thus, the totality of Theoretical Sciences from the first into the special sciences on the one side and the unifying philosophy on the other.

If we abstract from philosophy, we have thus to subdivide further the specialistic sciences. It would be certainly unfair to the actual tendencies of the scientific life of our day if we accepted the scheme which was more or less modeled after the old positivistic samples. The work which our modern historians are doing, the work of the students of litera-

ture and language, of art and religion, is not done in the spirit of those who saw in it only special applications of natural laws and thus a sociological department of biology. However widely opinions may diverge as to the logic of historical thinking, the whole scientific work of our time is decidedly aware of a fundamental difference between the naturalistic and the historical attitude toward the world. We should thus have to divide the non-philosophical theoretical sciences into naturalistic and historical sciences. The historical sciences which aim toward a connected view of the one development of our human civilization might then be subdivided into political history, history of art, history of religion, history of language, history of economics, and so on.

The natural sciences, on the other hand, which start from the single objects only to find the general laws might well be subdivided with reference to their mutual dependence. We have, then, in mechanics the science of the most general relations of natural objects; and if mechanics represents the top of this pyramid of special sciences, the lower level would be represented by physics and chemistry and the broad basis by astronomy, geology, mineralogy, botany, zoology, anthropology. There would remain uncertain the position of mathematics. In some and very important respects mathematics is a science which studies the formal relations of the natural objects and might thus well be grouped with mechanics. But at the same time mathematics has its fundamental relations to logic and thus to philosophy. The elements of mathematical knowledge are not found, like the physical things, but are created by human thoughts and their relations are valid for the universe because we cannot think the universe otherwise than through the categories of our thought. It must depend upon the emphasis which we lay on the one or the other side of the mathematical science whether we group it with philosophy or with the natural sciences.

We have further to acknowledge that the totality of sciences which are naturalistic in their logical structure cannot be grouped together into that one pyramid whose top is mechanics, because we have so far neglected the psychological sciences. Their general constitution corresponds indeed completely to the natural sciences and is thus also sharply to be separated from the historical sciences; but their material cannot be brought under the category of mechanical movement. The mental phenomena are certainly related to the physical brain process, but the meaning of psychology is destroyed if physiological processes are really substituted for mental facts. We have thus to consider the sciences of mental life as a special group of naturalistic sciences. The top of their pyramid would be general psychology, and its basis the special sociological sciences. While psychology is thus independent and not at all merely a part of biology, we have to acknowledge it as a special science and thus to keep it separated from philosophy. That does not deny that by many traditional ties psychology is still nearly related to philosophy and it will remain so, inasmuch as its special work is more than that of other sciences dependent upon a critical philosophical examination of its fundamental conceptions.

HUGO MÜNSTERBERG,
Late Professor of Psychology, Harvard University.

SCIENCES, National Academy of, an association incorporated by act of Congress, 3 March 1863, the object of which is to investigate, examine, experiment and report upon any subject of science or art whenever called upon by any department of government; the actual expense of such investigations to be paid from appropriations which may be made for the purpose. The Academy holds a stated session each year at Washington, D. C., in April and another in autumn at such places as may be determined. In 1918 there were 135 active members and foreign associates, comprising investigators in every department of science. Headquarters in Smithsonian Institution, Washington, D. C. A national research council is connected with the Academy.

SCIENCES, Normative. Normative sciences are systems of propositions whose contents are not facts, but norms; not experiences but values, and whose teaching is, therefore, not that something is, but that something ought to be. There is thus a possible place for logic, ethics and æsthetics, for philosophy of law and religion. Yet it would be meaningless to apply the term, normative sciences, to every kind of logic, ethics and æsthetics. The term has gained its characteristic importance in immediate relation to certain definite philosophical presuppositions. The conception of norm is intended to mean more than an empirical prescription, more than a social agreement which binds the individual through merely social inducements, and also more than a merely biological necessity. A large variety of so-called philosophical enterprises has been at all times and is to-day satisfied with just such sociological or anthropological doctrines of ethical, æsthetic and logical functions. There is indeed no logical difficulty in building up a system of ethics, for instance, which describes and explains how at different times and with different peoples different groups of actions became enforced through the organs of society. Biological sociology can easily show that a social organism can exist only when certain rules of behavior secure a social harmony. From the standpoint of such empirical philosophy, the moral conscience becomes an emotion which is artificially trained by the suggestions of education and the norm of action has no more value than any legal statute which is voted by a majority and reinforced by threatening the violators with punishment. From the same standpoint æsthetics describes and explains the various tastes which have been developed in the history of civilization by the silent agreement of the richest minds, their norms shading off into the changing prescriptions of fashion. Finally, in a similar way, logic becomes a description and explanation of those ways of thought which a

certain period accepts as leading to such propositions as a particular society calls its truth.

In all these cases it is not meaningless to speak of an ought. Anyone who wants to agree with the demands of the community stands under a certain obligation to act, to feel and to think in the prescribed way. He must subordinate his particular wishes to the general trend, otherwise he will appear immoral or tasteless or erratic. On the other hand it is evident that the so-called norms cannot claim any other authority than as being the expression of the will of a number of individuals and as offering a certain appropriateness for the development of the social organism. Such sociological systems would themselves repudiate every idea of an absolute value for the ethical, æsthetic and logical norms; the impossibility of such a claim would seem to them sufficiently proved by the fact that one nation or one period prescribes to the conscience actions which are forbidden at another time or by another nation. In the same way the history of art shows how the æsthetic standards were changing all the time, and the history of science demonstrates how the scientific theories were always only the expressions of certain tendencies, superseded constantly by new ideas. It would thus appear absurd to claim an eternal value for the norms of behavior, of art and of science which chance to be influential with us to-day.

Those who believe in "Normative Sciences" do not contest the facts which are gathered in such sociological disciplines, and they do not underestimate their value. But they see in all such empirical accounts only contributions to the history of civilization and they believe that the conception of norms can be taken in a deeper sense, independent of the advanced prescriptions of a social organization. Norm means to them an absolute obligation, and only the consequences of the absolute values constitute for them a true Logic, Ethics and Æsthetics. Those sociological doctrines then become merely empirical introductions to the true philosophical discipline of valuable acting, feeling and thinking. The norm is then sharply to be separated from anything which in principle changes like fashions and tastes or legal statutes. The norm is that which is absolutely valuable without any reference to any individual or to any social group of individuals, independent alike of the chance obedience which individuals offer to it and of the effects which may result from its application. That two times two is four is a truth which is eternally valuable; that is, which remains valid without any reference to the question whether we understand it or not. No one may think it truth, but everyone who wants to think, ought to think so, if he is to be acknowledged at all times as a logical subject. It is of course meaningless to ask for the reasons or for the causes of such an absolute value. It is the ultimate foothold for our thought. Whatever we might offer as an explanation would have meaning only if we again called it a truth, and if we had to give account of what we mean by that, it could again be only the acknowledgment that it is that thought which we ought to think. It is a thought which we think without reference to our personal interests and without reference to any social demands but simply because we ac-

knowledge an absolute duty to prefer this thought to its opposite.

Of course, there remains the possible objection that we can live our life without respecting such absolute duty; that we can think, for instance, without claiming more than relative value for our thoughts. We should thus be satisfied with the conviction that whatever we call truth may be found untrue by a future generation. But the philosophers of the normative sciences answer that this is an impossible standpoint. A knowledge which is not anchored in any absolute truth contradicts itself. If, for instance, the skeptical sociologist insists that there is no absolute truth, this at least is a judgment which he affirms with the conviction and with the understanding that it is itself a truth of absolute character, otherwise its meaning were lost. A consistent relativism, in short, destroys itself in the field of thought, and the acknowledgment of absolute norms is thus the indispensable presupposition for logic. A particular thought or a particular theory may, of course, be superseded, but the duty to think consistently and in accordance with logical axioms cannot be touched by the changes of civilization.

The same holds true for morality. The particular rules may change, but the meaning of morality is lost if we do not give absolute value to the fulfilment of duty. It depends upon chance conditions, which contents become the duty of the man; but he is to do what his duty prescribes independent of his personal desires, ready to sacrifice himself for that which he acknowledges as his duty; that is a norm of absolute value. The normative ethics, just as the normative logic, thus are formal disciplines. But just their independence of any special content makes those logical and moral forms eternally valid. The same repeats itself finally in the field of art and religion where again the absolute form may be filled with the varying content which the history of civilization offers, but where the form alone gives eternal meaning to the ought which is involved.

HUGO MÜNSTERBERG.

SCIENTIFIC MANAGEMENT. Definition.—The term *scientific management* characterizes that form of organization and procedure in purposive collective effort which rests on principles or laws derived by the process of scientific investigation, experiment and analysis, instead of on tradition or on policies determined empirically and casually by the process of trial and error. The principal phases of scientific management are: (1) Exhaustive investigation of the elements usable in collective effort—manual and machine processes, materials, tools and equipment, physical and psychological operating conditions—and their reactions in all possible relations, in order to determine the combination which for any specific purpose is most economical in technical energy—human and material; the formulation of the results of such investigation in principles and laws, and the establishment on the basis of such principles and laws of standards of procedure and result; (2) the development and maintenance of such precise and automatic co-ordination and control of the collective effort as to accomplish, in accordance with the established standards of procedure and result, with

economy of energy and time, any purpose of the collective effort; (3) organization of the personnel, processes, materials and equipment in such functional co-operative relations as to bring to bear in the collective effort the highest available and developable technical skill in planning, supervision and execution.

A clear understanding of scientific management requires that management be not confused with administration. Management characterizes the organization and procedure through which collective effort is effected; administration characterizes those considerations and decisions which establish the purposes which create the need for management and those broad, governing policies under which the management proceeds. Whether a railroad shall expend capital in further development of a main line for better service or in the acquisition of feeders for larger traffic, whether a manufacturer shall distribute through the established trade channels or through branches and stores established by himself, whether a department store shall sell trade mark merchandise or private brand merchandise, whether any institution shall operate in an extensive or a restricted area, serve a particular class of the public, establish an open or closed shop or admit its workers to some sort of participation in administration and management, are administrative problems. These problems once settled and policies relating thereto determined by the administrative authority (which may overlap or even coincide with the management authority), managerial problems arise concerned with establishing an organization and procedure, and the conduct of such procedure, to carry out the administrative policies. This distinction between administration and management clearly in mind, it may be understood that administration is largely a process of forming judgments, may have serious social, political and other moral aspects, must be largely empirical and can utilize in but a limited way principles and laws determined by the scientific method of investigation; whereas management on the other hand is concerned with the relations and reactions of particular forms of organization, routine, materials, equipment and physical and psychical conditions, may proceed upon principles determined by the scientific method of investigation and is more or less mechanistic in its nature. It may be understood also how, through absence of a clear comprehension of the difference between administration and management, and through a failure to distinguish between the nature and technical efficiency of scientific management *per se* and the administrative problems (social, political and otherwise moral) arising from its use, confusion and controversy have appeared in the public's attempt to appraise scientific management.

Early History: The System.—In 1878 Frederick Winslow Taylor (1856–1915) entered the employ of the Midvale Steel Company as a laborer who had served his apprenticeship as pattern-maker and machinist. He became successively time clerk, lathe gang boss, assistant foreman, master mechanic of repairs and maintenance, chief draftsman, and in 1884, at the age of 28, chief engineer. From the beginning of this period he was in continual struggle with the workmen to increase output, which he

knew from his experience as a workman was extremely low. There developed the anomalous situation, not infrequent in industry of that day, of agreeable personal relations between foreman and individual workmen accompanied by a bitter struggle concerning output between foreman and the workers as a group. Taylor, as foreman, attempted to apply the then customary foremen's method of suasion and force with the usual result of increasing the bitterness of the struggle. Concluding that he could master the situation only by knowing more than the most skilled workman about the technique of production in the shop, and about what a skilled workman should do, he applied his investigative and inventive mind (he came subsequently to hold over 100 patents) to the problem and began two lines of experiments which he pursued through many years with great thoroughness and at great expense. One related to the machine, the tool and the material (metal cutting), and the other to the workman's method of handling the machine, the tool and the material (time and motion study). The former line of experiments, continued later at the Bethlehem Steel Company, led to the discovery of high-speed steel, and revolutionized the art of metal cutting ('Transactions American Society of Mechanical Engineers,' XXVIII, 21, 1906); the latter line of experiments greatly broadened led to the development of a co-ordinated system of shop management and ultimately, as an interpretation of that system, to the formulation of the philosophy of management which came to be known as scientific management. The logical and approximately the chronological steps of the development of the system of management, essential to an understanding of the principles which came to be formulated, were: (1) Experiments leading to dependable knowledge of how long a particular machine operated, or a particular manual process performed, by a skilled workman would require to accomplish any specified result, with a given material, according to a specified most effective method of operation, and under specified working conditions. This knowledge, obtained principally by stop-watch studies of unit-time performances, permitted the setting of practicable standards per man-hour or machine-hour higher than the average of current performance; (2) the establishment of a routine of preparation and direction which would ensure maintenance of the conditions under which the standards were set, which led to the working out of such mechanisms as routing, order of work, instruction cards, purchasing materials according to specifications, central stores and controlled conditioning and delivery of materials and tools; (3) the selection and assignment of personnel to machines or operations on the basis of skill and the further development of skill in workers; and (4) the establishment of specialized skilled supervision of workmen to ensure maintenance of conditions and to provide instruction. These objects (3 and 4) were accomplished by functionalized foremanship, a gang boss having general supervision of the order of work in the shop, a speed boss supervising the setting up of the machine and an inspector inspecting the product both at the beginning and at the completion of a job. (5) The constant and current

checking of progress against standards by cost accounting, the data for which was derived from the operating papers; and (6) of far-reaching importance in its ultimate influence on the managerial attitude of mind, the substitution in place of the conventional "foremen's persuasion" in securing performance by workers, of voluntary application on the part of the latter through the incentive of a higher wage made possible by the increased productivity. During the years 1891-1900 these gradually developed devices became co-ordinated into a smoothly-working system, in which those supervisors whose duties required personal contact with workers remained in the shop, while those whose duties were in the nature of planning, preparation and control through "papers" were brought together in an office called the "planning room," adjoining the shop.

Later History: the Principles.—The interpretation of this system of management in terms of principles of management seems to have been inspired by Taylor's contacts in the American Society of Mechanical Engineers, which he joined in 1886. In that year, Henry R. Towne presented to the society the paper "The Engineer as an Economist" (*Transactions American Society of Mechanical Engineers*, VII, 425-32, 1886), significant because first directing attention to management as something other than the expression of executive ability, in the assertion that to ensure good management there must be joined to executive ability "a practical knowledge of how to observe, record, analyze and compare essential facts in relation to wages, supplies, expense accounts, and all else that enters into or affects the economy of production and the cost of the product." During the 10 years following the presentation of that paper other papers, relating principally to a particular phase of the management problem—methods of wage payment, were presented and discussed in the Society. Taylor's "A Piece Rate System" (*Transactions American Society of Mechanical Engineers*, XVI, 856-903, 1895) is the most notable among these in that he therein described the general system of management which he had developed, arguing that it embodied managerial principles which must be the basis of any sound system of wage payment involving premiums or other differential reward. The title and emphasis of this paper centred attention on his differential piece-rate and not, to his disappointment, on the management principles implied. Therefore, in 1903 he again appeared before the society with the paper "Shop Management" (*Transactions American Society of Mechanical Engineers*, XXIV, 1337), in which he attempted to direct attention from his piece-rate system to what he called a philosophy of management. The body of this philosophy, as presented by him, was essentially the following principles: (1) The objective of good management is the combination of high wages and low unit costs; (2) this objective can be achieved only by the application of strictly scientific methods of research and experiment to the study of the detail problems of management, and (3) the establishment thereby of laws or principles which may be expressed in standards of procedure which give control of operation; (4) the scientific selection of workmen, materials and processes and the establishment of work-

ing conditions to meet the requirements of the standards; (5) the scientific training of the workmen to improve the application of their skill in accordance with the standards; and (6) the establishment of such intimate and friendly co-operation between management and workers as to ensure a stability of the psychological environment of the shop which would make possible the application of all the principles above enumerated and the utilization of the mechanisms necessary to give them effect. It should be observed that a systematic and complete formulation of the principles of scientific management was not for Taylor or his generation.

Recent History: since the Eastern Rate Case.—Again Taylor's audience in the American Society of Mechanical Engineers failed to appreciate the significance of his contribution. Interest of the members of that society and of the public in general was attracted, not by these serious, scientific papers and discussions, but by sensational testimony concerning the results of scientific management in the shops in which it had been developed, given at a hearing before the Interstate Commerce Commission in 1911, involving consideration of the efficiency of the railroads (*Interstate Commerce Commission reports*, XX, 243), and at an investigation in the same year by a special committee of the House of Representatives appointed to investigate, on a petition of organized labor, the effects of Taylor methods at Watertown Arsenal. It was at these hearings and in the title of a book which Taylor published at this time (*Principles of Scientific Management*, 1911) that the term "scientific management" was first used. From that time on public interest in scientific management was intense and sustained, and discussion of it continuous and occasionally acrimonious, although not always discriminating. Interest and discussion was not confined to the United States, and foreign demand caused the translation of Taylor's papers into French, German, Italian, Japanese, Dutch, Russian and Lettish.

This sudden intensification of interest in scientific management may be accounted for by the fact that in 1911 the industrial community was prepared for such a body of logical and practical management principles manifested in a comprehensive system of management mechanisms. There had been for a decade a growing general interest in betterment of management. This general interest had yielded improved management devices such as cost accounting and "systems" of control through "forms" which made more precise but did not modify to any great extent existing practice. It had inspired an increasing volume of books and articles concerning special problems of management and descriptive of industrial organizations and procedures which represented the best in existing practice. It had led to books and articles of an exhortatory nature and of stimulating influence which gave a touch of idealism to the consideration of management problems (*Harrington Emerson, 'Efficiency as a Basis for Operation and Wages,' 1909; 'Twelve Principles of Efficiency,' 1910*). But it was not until the Eastern Rate Case of 1911 that interest became widespread and intense. The testimony concerning the accomplishments of scientific management in decreased unit costs and in-

creased profits combined with higher wages appealed to the primary motive of industrial activity; the completeness and coherence of Taylor's system and of the principles which it expressed appealed to the intellect of the serious student of management problems; and the very term "scientific management" appealed to the imagination of everyone. The public mind and discussion at once seized upon the term and gave it a generalized application almost as broad as had been represented by the term "efficiency." For that reason students of management must exercise discrimination in distinguishing between the definite, historical meaning and the popular, generalized meaning of the term, and between real, partial and in some instances alleged cases of the application of the principles.

Results.—The results of the development of scientific management in industrial plants have not been adequately summarized and presented. Management engineers have been conservative, as a matter of professional ethics, in disclosing results of work in the plants of their clients. Many investigations by others have been vitiated by one of two attending circumstances; either the investigator has been biased in a desire to find controversial evidence or by a preconceived philosophy of industrial relations; or he has failed to inform himself concerning the history and nature of scientific management, and has been led to investigate plants reputed to have, but really not having, scientific management. The most reliable and complete evidence of results is to be found in the records of the hearings before the Interstate Commerce Commission and of the special committee of the House of Representatives, referred to above, veritable mines of information, and the most satisfactory summaries in articles by C. Bertrand Thompson ("The Theory and Practice of Scientific Management," Ch. III) and Henry H. Farquhar (in *Quarterly Journal of Economics*, XXXIII, 466); in Brandeis' "Scientific Management and Railroads" (1917), a published part of a brief submitted to the Interstate Commerce Commission, and in the reports of the Chief of Ordnance, United States of America, 1911, 1912 and 1913. It is the concurring testimony of these several investigations that scientific management reduces unit costs and increases wages and profits, in many instances simultaneously with reduction in selling prices, and that industrial relations with the workers immediately concerned are improved.

Labor and Scientific Management.—An almost incomprehensible phase of the history of the scientific management movement is the existence, side by side, of improved industrial relations in those plants in which scientific management has been developed and strong opposition on the part of the management of the American Federation of Labor. The opposition of the management of organized labor seems to have been inspired by fear of the impairment of a fundamental element of their strategy (that their organization must be increased in membership and held intact, for the accomplishment of their larger objectives) by one of the least important mechanisms of scientific management, the differential wage system. Inspired by this fear, and taking advantage of certain opinions held by workers (such as the opinion that increased output will cause unem-

ployment) and certain infelicities of speech and illustration on the part of expounders of scientific management (such as the famous Schmidt case), and presenting statements concerning the actual operation of scientific management not based on critical investigation and not conforming to facts (that workmen are speeded up and worn out, that time-studies are secret, that rates are cut, etc.) the management of organized labor undertook a campaign of education of its membership which resulted in an almost solid opposition by the rank and file as well as the officers of organized labor to scientific management. In public discussion, to the opposition of organized labor was added the opposition of many social scientists who, without information derived from either experience or investigation, asserted that scientific management would make impossible the achievement of any ideal of industrial democracy. Throughout all this controversy the natural confusion of polemical discussion was worse confounded by absence of critical investigation of facts, inadequate information, and particularly by a failure to distinguish in the discussion of scientific management as a social problem, between management and administration. In this controversy the arguments against scientific management as a system of management technique were ineffective because not supported by the facts; on the other hand the arguments against scientific management with respect to its social implications were significant and of influence, but they were really arguments concerning administrative policy governing the use of management technique, and not more pertinent to scientific than to any other form of management. Superficial critics failed to perceive the point that the effective working of the scientific management mechanisms in particular depends so vitally upon sympathetic co-operation between planner, supervisor and operator, that anti-social administrative policy is inconsistent with its development and technical effectiveness.

Influence of the War.—The status of scientific management has been profoundly influenced by the war. Three influences are noteworthy: (1) Although the prejudice of workers engendered by the sharp controversy preceding the war has not disappeared, open and active hostility of labor has been discontinued and apparently will not be resumed; (2) the demand for output during the war, supported by labor, compelled a wider extension of efficient production methods, in some instances of the methods of scientific management, not only in the United States but also in Europe, and both labor and management have learned by experience that scientific management technique is not inconsistent with wise, humane and co-operative administrative policies; (3) labor and management have observed that during and following the war managers of scientific management plants and scientific management engineers have been in the van of those inspiring and directing the establishment of the most humane and co-operative administrative policies, in accordance with the most farsighted principles of industrial relationship. War seems to have cleared away prejudice and misunderstanding and to have made possible an appreciation of the value of scientific management as an instrument for the increase of the productivity of human effort under wise administration.

HARLOW S. PERSON,
Managing Director Taylor Society, New York City.

SCIENTIFIC SOCIETIES, organizations of scientists for the furthering of scientific study. They are largely devoted to the furthering of research work and the publishing of scientific journals, memoirs, etc.; and their conventions, which in the case of the larger societies are usually held in different large cities, promote discussion and intercourse among scientific students. The most important of the older scientific societies of foreign nations are the Royal Society of London (founded 1660), the Royal Institution of Great Britain (1799), the French Academy of Sciences (1666), the Imperial Academy of Sciences, Russian (1725), and the Royal Academy of Sciences of Germany (1700), of Sweden (1739) and of Denmark (1743).

The American national societies include the American Philosophical Society, founded 1743, the American Academy of Arts and Sciences (1780), the American Association for the Advancement of Science (1848), and the National Academy of Sciences (1863). In addition there are local academies or scientific societies in many States and cities. These often have a museum and scientific library, and hold meetings for scientific discussion. The oldest of these is the Connecticut Academy of Arts and Sciences at New Haven, founded in 1799; the Maryland Academy of Sciences dates from 1819; the California Academy of Sciences, in San Francisco, from 1853. So many have since been established that it is impossible here to catalogue them. In all of the States there are academies that hold winter meetings, with programs covering the different sciences. Among the prominent city institutions are the New York Academy of Sciences, founded 1817, the New York Scientific Alliance, the Philadelphia Academy of Natural Sciences, the Boston Scientific Society, the Boston Society of Natural History and the Chicago Academy of Sciences. Other cities having scientific academies or societies are Salem, Worcester, Gloucester and Williamstown, Mass.; Portland and Augusta, Me.; Hanover and Keene, N. H.; Brattleboro, Vt.; Providence, R. I.; Hartford, Meriden, New Britain, Middletown and Bristol, Conn.; Albany, Buffalo, Rochester, Binghamton and Poughkeepsie, N. Y.; Reading and Media, Pa.; Wilmington, Del.; New Orleans, La.; Saint Augustine, Fla.; University, Ala.; Chapel Hill, N. C.; Detroit, Mich.; Saint Louis, Mo.; Brookville and Terre Haute, Ind.; Elgin, Peoria and Princeton, Ill.; Davenport and Muscatine, Iowa; Saint Paul, Minn., and Topeka, Kan.;

Santiago and Santa Barbara, Cal., and Tacoma, Wash. In addition, there are various institutes that are really the home of many scientific societies. See SMITHSONIAN INSTITUTION; CARNEGIE INSTITUTION OF WASHINGTON; BROOKLYN EDUCATION, etc.

The work of these general societies has suffered from the specialization which the growth of modern science requires; the American Association for the Advancement of Science, the New York Academy of Science, and others of the larger organizations have met this requirement by a subdivision into sections for the different sciences. The specialization, however, has been favorable to the establishment of local and national societies devoted to single sciences and the various technical branches. All the leading sciences have national organizations in the United States; among such are the American Chemical Society (1876), the American Entomological Society (1859), the American Mathematical Society (1888), the American Society of Naturalists (1883), the Astronomical and Astrophysical Society of America (1897), the Botanical Society of America, and the Geological Society of America (1888). The societies of technical science, while somewhat concerned with the professional interests of their members, are chiefly devoted to research. The oldest of these is the American Society of Civil Engineers (1852); others are the American Institute of Electrical Engineers (1884), the American Society of Mechanical Engineers (1880), and the American Institute of Mining Engineers (1871). For a complete list consult 'Handbook of Learned Societies,' published by the Carnegie Institution at Washington, D. C.

SCILLA, SQUILL, WILD HYACINTH, or BLUE BELL. See BLUEBELL.

SCILLY (sīl'ī) ISLANDS, England, a rocky granitic group at the entrance to the English Channel, forming part of Cornwall, about 30 miles from Land's End. They rise abruptly from the sea, form a compact group about 30 miles in circumference, and are about 140 in number; there are only six of any importance, the remainder being mere rocks and islets. The six are Saint Mary, Saint Agnes, Saint Martin, Tresco, Bryher and Sampson. Saint Mary, the largest, contains Hugh Town, the capital. Telegraph and telephone connections with the mainland and a periodical steamer service with Penzance facilitate communication. The climate is very mild and equable, and plants flourish out-of-doors that do not grow elsewhere in England. The inhabitants are chiefly engaged in flower-growing, agriculture and fishing. Immense quantities of narcissus and similar flowers are sent to London in spring, and early potatoes and other vegetables are also grown. The grain crops include a small proportion of wheat. On several of the islands are to be seen prehistoric remains of rude pillars, circles of stones, kistvæns, rock basins and cromlechs. The islands are the unsubmerged portions of the traditional land of Lyonesse. The group is named from an almost inaccessible island about an acre in extent, probably from its position near dangerous rocks, similar to that of Scylla near Sicily. The islands were granted to some monks, who settled at Tresco, by Athelstane in 936. Subsequently Henry I granted them to

the Abbey of Tavistock, and Queen Elizabeth gave them to the Godolphin family. They are now the property of the Crown.

SCINTILLATION, the scientific term for what is familiarly called the twinkling of the stars. We all know that this cannot arise from any actual change in the light of the star itself; and it must have long been evident that it is due to the atmosphere through which we necessarily see the stars. But the exact way in which the atmosphere produces this effect is a question on which the views of experts have differed. Arago, in an essay on the subject, cites a dozen different explanations of the effect; and since his time many other writers have propounded explanations. But there is not so much divergence between these different theories as might appear at first sight, and physicists of the present day will probably agree upon the essential cause of the phenomenon. If the atmosphere were perfectly at rest, it is certain that there would be no twinkling, any more than there would be in looking at a star through a piece of glass. The stars scintillate because the atmosphere is continually in motion. Invisible waves produced by the ascent and descent of warm and cold currents of air are always present. We can see these waves at the side of a hot stove, or, in summer time, on the side of a brick wall heated by the sun, or on a road passing over the top of a hill when we are so situated that the sky-line is the road itself, and the latter is heated by the sun's rays. In consequence of these wave-like motions, a ray of light coming from a star is continually undergoing a slight refraction or bending of its course, which is changing every moment and is not the same even for two rays side by side. The result is that a ray of light which would reach the eye if it kept on its course is refracted away, while another ray reaches the eye which was not directed exactly toward it. But there may be no relation between these two rays; and thus sometimes for a moment less light will reach the eye, and at the next moment more. Thus we have the scintillation. The rays which actually come to the eye also reach it from slightly different directions. Thus the direction of the star also seems to change in twinkling, but this change is not noticeable except when we use a powerful telescope. Then, in an unsteady atmosphere, the stars seem to dance round and change their form in a manner which is very troublesome to the astronomical observer.

It is not the stars alone which twinkle. If we watch gas or electric lights of an evening several miles away we shall always see twinkling. As a general rule, the planets do not twinkle like the stars unless very near the horizon. This is because their visible disc has a certain surface, so that the rays of light which reach the eye from the planet do not pass through the air along a single fine line, but form a cone of which the breadth at any point is proportional to the distance of the point from the eye of the observer, and may be a foot or more in diameter at a distance of two or three miles.

If we view a bright star through a spyglass and give a slight motion to the latter so as to shake the image of the star round, we shall see that it is continually changing in color, going through most of the colors of the spectrum from

red to blue. This is probably caused by the different refractions of the rays of light of different colors, which are separated in the way we have described and then brought together again. The result may be partly due to the interference of light, an effect which cannot be treated in the present article.

The scintillation is always greater near the horizon, and least around the zenith. This is because the layers of the air are denser and more disturbed near the horizon, while the course of a ray of light through them is longer.

SIMON NEWCOMB.

SCIO, sī'ō or shī'ō. See CHIOS.

SCIOPPIUS, stsē-ōp'pē-oos, Kaspar, German scholar: b. Neumark in the Palatinate, 27 May 1576; d. Padua, Italy, 19 Nov. 1649. He received his education at Heidelberg and at Altdorf, and before the age of 21 had published several learned books, the most noted being his 'Verisimilium Libri Quatuor,' and 'Suspectæ Lectiones,' which attracted the attention of Pope Clement VIII. During a visit to Italy in 1589 he renounced Protestantism, and became a protégé of the Vatican. He is said to have written more than a hundred books, most of them under an assumed name, satirizing the leaders of the Protestant movement. The first person whom he attacked was the illustrious Joseph Justus Scaliger (1540-1609), against whom he launched his 'Scaliger Hypobolimeus' (1607), in which he also assailed Henry IV. In 1608 he published more than 20 pamphlets against the Protestants, urging the Roman Catholic powers to exterminate them. Among his later books the most notable are 'Grammatica Philosophica' (1628), and 'Paradoxa Literaria' (1628).

SCIOTO, sī-ō'tō, a river in Ohio which rises in Auglaize County, flows southeast for a few miles, then northeast into Hardin County, then south by east to near the centre of Marion County, from where its general direction is south to the Ohio River, which it enters near Portsmouth. Other cities on its banks are Columbus, Circleville and Chillicothe. It is about 200 miles long, is navigable for about 130 miles and for 90 miles feeds the Ohio and Erie Canal. It flows through a fertile valley.

SCIOTO COMPANY, The, in American history, a land-speculating organization formed in the Eastern States in 1787 for the purchase of territory along the Ohio and Scioto rivers. John Cleves Symmes, Joel Barlow and William Duer, of New York, were largely interested. The organizers at first bought lands of the Ohio Company and appointed Barlow their agent in Europe to make sales of them and to induce immigration. Barlow had been in England previously on similar business for the Ohio Company. Symmes parceled out the lands to other parties, the tract which now embraces the city of Cincinnati falling to the share of Matthias Denman, Robert Patterson and John Tilson, of New Jersey. As a result of Barlow's activities 218 emigrants sailed from Havre to settle on those lands, 19 Feb. 1790. About 50 of them settled at Marietta and the remainder formed the Gallipoli's settlement. The emigrants suffered from lack of promised supplies and inability to get clear titles to their lands, and

the company, failing to meet its obligations, was charged with swindling operations.

SCIPIO ÆMILIANUS AFRICANUS MINOR, sĭp'ī-ō ē-mīl-ī-ā'nūs ōf-rī-kā'nūs mī'nōr, Publius Cornelius, Roman soldier: b. about 185 B.C.; d. 129 B.C. He was an adopted son of P. Cornelius Scipio, the son of Scipio Africanus Major. He began his public career in 151 when the Roman senate was about to dispatch a new army to repress the disturbances in Spain. Exasperated by the constant failure of the wars against the Spanish tribes, the people obstinately refused to serve. At this juncture Scipio came forward, and by a spirited and powerful harangue, made such an impression on the public mind that a multitude of Romans of all classes voluntarily enlisted. In 152 he accompanied the consul Lucius Licinius Lucullus to Spain as military tribune. In 149 B.C. the Third Punic War broke out, and Scipio followed the army to Africa. He served under the consul M. Manlius Nepos, and by his courage and vigilance rendered important services. Manlius recommended him in the most emphatic manner to the senate. Hence in 147, contrary to the usual custom, not being of the legal age, he was unanimously chosen consul and leader of the forces against the Carthaginians. The Carthaginians defended themselves with desperate courage, but although able to hold out until winter brought a temporary cessation of hostilities, on their resumption Carthage was reduced in 146.

By the express command of the Roman senate this rival of Rome, once so powerful, was demolished and burned. The sight of the ruined city affected Scipio to tears. He was honored with a magnificent triumph at Rome after the war was terminated, and was surnamed the "younger Africanus." After he had lived for some time as a private citizen he was sent with other ambassadors to Egypt, to King Ptolemy Euergetes, where he was much admired for his genuine Roman moderation, and his thirst for knowledge. When he returned (142) he was elected censor. In 134 he entered on his second consulship, in order to put an end to the war long carried on with Numantia. After a siege of eight months he forced a surrender.

For his conquest of this powerful city a triumph was decreed to Scipio, and he received the surname of "Numantinus." In the last years of his life he made himself many enemies among the people by opposing the measures of the popular party, and especially the agrarian law of Tiberius Gracchus, of which Papirius Carbo and Gaius Gracchus, the tribunes of the people, were the great supporters. The circumstances of his death indicate that he was poisoned by his foes.

SCIPIO AFRICANUS MAJOR, sĭp'ī-ō āf-rī-kā'nūs mā'jōr, Publius Cornelius, Roman soldier: b. 237 (?) B.C.; d. 183 B.C. In 212 he was unanimously elected ædile, and in 210 became proconsul in Spain. His first successful enterprise of importance was the conquest of New Carthage, the stronghold of the Carthaginians in Spain. For the kindness and magnanimity he displayed on this and other occasions toward the native Spaniards he was rewarded by numbers of them attaching themselves to his standard. The next year (209) Scipio totally defeated Hasdrubal, Hannibal's brother, notwith-

standing the latter's advantageous position, but was unable to prevent him collecting more troops, and eventually crossing the Pyrenees to the assistance of Hannibal. In the meanwhile the Carthaginians collected a fresh army, which Scipio decisively defeated in 207. The result of this and subsequent engagements of minor importance was that the Carthaginians were wholly driven from Spain, and the greatest part of their country subjected to Rome. In 205 Scipio was elected consul. He now besought the senate to allow him to lead an army against Carthage herself, and was accordingly empowered to go to Sicily with an army and a fleet, in order, after mature deliberation on the means of effecting a landing on the coast of Africa, to execute the plan he had formed. In 204 he sailed from Lilybæum and landed in Africa, where he prosecuted hostilities with increased vigor, and such success as to oblige the Carthaginians to recall Hannibal from Italy. The Carthaginian army, however, had been by this time so much reduced that that general was able to effect but little change, and after some fruitless negotiations for peace the great battle of Zama was fought 19 Oct. 202 B.C., resulting in the total defeat of the Carthaginians. The latter, on the advice of Hannibal, sought for peace, which was granted on hard conditions. On his return to Rome, Scipio was honored with a triumph, and received the surname of "Africanus." He was censor in 200 and consul in 194 (with Titus Sempronius Longus). In 189 he was accused of peculation and bribe-taking. When his trial came on he contented himself, in answer to the accusations of his enemies, with reminding them of what he had done for the republic, and ended by saying that this was the anniversary of the defeat of Hannibal at Zama, and calling upon the people to neglect all disputes and lawsuits, and follow him to the Capitol, there to pray the gods that they would grant the Roman state other citizens like himself. This they did, leaving the accusers alone in the forum. Scipio immediately quitted Rome, and retired to his villa at Liternum, where he spent the few remaining years of his life.

SCIRE FACIAS, sĭ'rē fā'shī-ās, a judicial writ, directing the adverse party to show cause why the plaintiff is not entitled to execution or other benefit on a judicial record, as a judgment, or why a non-judicial record, as a patent, should not be declared invalid; also, the proceedings under such writ. The defendant may make the same defenses to this writ as to an action. It is often issued to revive a judgment. In the Federal courts of the United States a proceeding in the nature of a scire facias is used to annul letters patent for inventions. In England it is still used in garnishee proceedings in certain cases, in revenue suits involving corporations, and to enforce judgments against shareholders in certain companies, but it has been abolished there in proceedings to annul letters patent for inventions. It has been abolished in some code States in this country and a motion used in its place.

SCIRPUS, sér'pūs, bulrush, sedge, a large genus of rush-like or grass-like plants of the sedge family (*Cyperaceæ*) universally distributed. Many species are of partial or complete aquatic habit, annual or perennial, some small or some

large. The small, perfect flowers have usually a perianth of bristles, and are in spikelets, with or without subtending involucre, and mature into variously shaped achenes. The spikelets are either solitary or in groups, and are very commonly umbelled. These plants are often called rushes or bulrushes, and are common in wet woods or swamps, and often rise conspicuously out of shallow water. *Scirpus cyperinus*, the brown wool-grass, has immense drooping umbels of spikelets, supported on slender cylindrical stems. It is perennial, two to six feet high, with curving grass-like leaves, and is a familiar plant at the edges of forest ponds, growing in colonies. *S. cernuus*, one of the few species cultivated, is a good pot-plant, having long drooping stems, forming a dense mat at the base, and with solitary spikelets. *S. lacustris*, the great bulrush of the Old World, is known as the mat-rush, because it was employed for weaving into mats, chair-bottoms and cordage. It is a curious aquatic plant whose very smooth, blue-green, tall stems bear at the top flexuous umbels of spikelets. This species and the allied *S. tatora*, are the "tulés" (q.v.) of the American Southwest.

SCIRRHUS, or **HARD CANCER**, a scirrhus cancer. See **CANCER**.

SCISSOR-BILL, a bird. See **SKIMMER**.

SCISSOR-TAIL, a beautiful flycatcher (*Milvulus forficatus*) of the lower Mississippi Valley, which receives its name from its habit of crossing and recrossing in flight the two very long outer feathers of its tail. It is white with dark wings and a roseate flush upon its breast and on the lining of its wings, and is exceedingly graceful. Its general habits are those of the flycatchers (q.v.).

SCISSORS. See **CUTLERY**; **HARDWARE INDUSTRY IN AMERICA**.

SCLEROMETER, sclér'òm-ě'tér, an instrument for the accurate determination of the hardness of minerals. In one form the mineral is mounted on a small carriage moving along a track. Upon this is a lever with weighted diamond point which is in contact with the surface to be tested. Weights are then added to a pulley connected with the carriage until they are just sufficient to move the carriage and produce a scratch on the mineral. In the micro-sclerometer of Jagger hardness is ascertained with any one of four variables: rate, weight, depth or duration (see *Amer. Jour. Sci.*, IV, 399, 1897). The sclerometer shows that different faces of crystals vary in hardness. By rotating a crystal through 180 degrees and recording the weight required to produce a scratch for each 10 degrees, it is possible to secure data from which the "curve of hardness" can be constructed. Jagger has determined the absolute hardness of some of the minerals in the Mohs scale, assuming a value of 1,000 for corundum, as follows: topaz 152, quartz 40, orthoclase 25, apatite 1.23, fluorite .75, calcite .26, gypsum .04.

SCLEROTIC, **SCLEROTICA**, or **SCLEROTIC COAT**. See **EYE**.

SCOLECIDA, skō-lēs'i-da, a group of worms and worm-like animals, mostly internal parasites, term now used only in a general way,

as its members have been more scientifically distributed in classification in the phyla *Platyhelminthes*, *Nematoelminthes*, etc.

SCOLECITE, skōl'ē-sīt, a mineral belonging to the natrolite group of the zeolite family. It is a hydrous silicate of aluminum and calcium, $\text{CaAl}_2\text{Si}_2\text{O}_{10} + 3\text{H}_2\text{O}$. When heated before the blowpipe it swells and sometimes curls up like a worm, to which property it owes its name, from the Greek *skolēx*, a worm. It then fuses easily to a white, blebby enamel, thus distinguishing it from natrolite, which fuses with equal ease and without intumescence to a colorless glass. Its crystal habit is slender-prismatic and much resembles natrolite. Its crystals are, however, horizontally striated on the prisms and are monoclinic twins, the twinning being revealed by feather-like diverging striations on the clinopinacoid, while natrolite crystals are orthorhombic and show vertical striations in the prismatic zone. Its snow-white or transparent, vitreous crystals are usually clustered in diverging groups. It is also found massive or in radiated nodules. It is a secondary mineral usually in trap or amygdaloid. Among the best known of its many localities are Poona, British India, and Beruford in Iceland; it has been found sparingly in the United States in the Palisades of the Hudson and at Golden, Colo.

SCOLLARD, skōl'ard, Clinton, American poet and novelist: b. Clinton, N. Y., 18 Sept. 1860. He was graduated from Hamilton College in his native place and was a professor of rhetoric and English literature there 1888-96 and 1911-12. He has traveled extensively, and since the last-named date has devoted his entire attention to literary pursuits. His early work was mainly verse of a light and musical character evincing great command of metres, but with no very salient characteristics. His later verse shows a marked increase of strength as well as melody, while the earlier facility has now become an almost faultless technique. The lyric is his especial field, although he has now and then attempted epic forms. In recent years he has produced several noteworthy historical romances. Among his books of verse may be cited 'Pictures in Song' (1884); 'With Reed and Lyre' (1886); 'Old and New World Lyrics' (1888); 'Songs of Sunrise Lands' (1892); 'Lyrics of the Dawn' (1900); 'The Lutes of Morn' (1901). His most important novels are 'A Man at Arms' (1898); 'The Son of a Tory' (1900); 'The Cloistering of Ursula' (1902); 'Lyrics of the Dawn' (1902); 'Count Falcon of the Eyrie' (1903); 'Foot-faring' (1904); 'The Lyric Bough' (1904); 'Ballads of Valor and Victory,' with Wallace Rice (1904); 'Lyrics and Legends of Christmas-tide' (1904); 'Odes and Elegies' (1905); 'A Southern Flight,' with F. Dempster Sherman (1906); 'Easter Song' (1907); 'Voices and Visions' (1908); 'Pro Patria' (1909); 'Chords of the Zither' (1910); 'The Vicar of the Marches' (1910); 'Songs of a Syrian Lover' (1911); 'From the Lips of the Sea' (1911); 'Lyrics from a Library' (1913); 'Poems—Selected' (1914); 'The Vale of Shadows and Other Verses of the Great War' (1915); 'Italy in Arms and Other Verses' (1915); 'Ballads Patriotic and Romantic' (1916); 'Let the Flag Wave and Other Verses'

(1917); 'Elegy in Autumn' (1917). Mr. Scollard edited Fords' 'Broken Heart' (1894); 'Ballads of American Bravery' (1900), and 'Poems' of Frank Dempster Sherman.

SCOLOPACIDÆ, skōl-ō-pās'ī-dē, a cosmopolitan family of wading birds, comprising the snipes, sandpipers, curlews and allied genera. The bill is long, very slender and flexible. They frequent bogs and marshes or the banks of rivers and ditches, where they probe the ground for worms, insects and testaceous mollusks. In the most modern classification these groups of birds are combined with the plovers, under the broader name *Charadriidæ*, of which all but the plover (*Charadriinae*) constitute the subfamily *Scolopacinae*. Consult Evans, 'Birds' (New York 1900).

SCOLYTIDÆ. See BARK-BEETLES.

SCOMBRIDÆ, skōm'brī-dē, a family of percomorphous fishes, comprehending the mackerel (q.v.) and its allies. The body has an elongated fusiform shape, oval in cross-section, with a conical pointed head and deeply forked caudal fin with falcate lobes. The scales are minute and anteriorly form a peculiar area known as the corselet, and the prominent lateral line takes a wavy course for its entire length. The mouth is large and armed with strong, sharp teeth, the eye large and the gill-slits extensive and free. Of the fins the pectorals and ventrals are small, the former situated high on the sides and the latter on the belly nearly or quite beneath them; the spinous dorsal is far forward and supported by slender spines; the second dorsal and anal are of similar shape and usually situated near the level of the vent, and each is continued to the base of the tail by a series of small detached finlets. The caudal peduncle is slender and bears lateral keels. The colors are generally metallic steel blue above, marked with bands, streaks or spots of black or yellow and silvery white or golden below. Internally the pyloric cæca are numerous and the swim bladder may be present or absent. The flesh is oily and a streak of deep red muscle extends along either side and is sharply distinguished from the remaining pale muscles. All of the mackerels are extremely active, predaceous, pelagic fishes, which roam far and wide over the sea in large schools and often approach the coasts to spawn. They are especially well adapted by the form of the body for rapid swimming, and resistance to the water is much lessened by the completeness with which all fins and other prominences can be depressed into recesses, so that they become exactly flush with the surface. The number of genera and species is not great, about 12 of the former and 60 of the latter being recognized, but most of them are widely distributed and have occurred or are likely to occur in our waters. Besides the mackerel, some of the most important are the Spanish mackerel, bonitos and tunnies or horse mackerel. Consult Jordan and Evermann, 'American Game and Food Fishes' (New York 1902).

SCONE, skoon, Scotland, a village in Perthshire, on the north bank of the Tay, a little above Perth, famous as having been the seat of one of the most noted Scotch abbeys. Scone is first mentioned in the beginning of the 10th century and in its abbey, built prob-

ably about the same period, was located the famous stone, according to tradition "Jacob's Pillow," on which the kings of Scotland were crowned, and which was carried by Edward I of England to Westminster Abbey where it rests under the coronation chair. The last coronation celebrated here was that of Charles II in 1651. The old abbey is represented only by scattered traces; on the site of the ancient palace stands the fine modern mansion of the Earl of Mansfield. The neat little village of New Scone nearby has about 1,500 inhabitants, chiefly engaged in hand-loom weaving.

SCOPAS, skō'pas, Greek sculptor: b. Paros, and flourished between 395-350 B.C. He was the son of Aristandros, a sculptor in bronze, and went to Athens about 377 B.C., where he lived about 25 years. He belonged to the Later Attic School of which Praxiteles was another distinguished member. For the temple of Athena Alea at Tegea he made the sculptures of both pediments and the statues of 'Asklepios' and 'Hygieia' for the interior. In various parts of the Peloponnesus he executed statuary, as for instance, the 'Asklepios' at Gortys, in Arcadia, a 'Herakles' at Sicyon; an 'Athena Pronaos' and on 'Artemis Eucleia' at Thebes; also a group 'Eros, Himeros and Pothos' (Love, Longing and Desire) at Megara. One of his most famous statues was the 'Bacchante,' ornamenting the theatre of Dionysus at Athens; another was the 'Niobe' of which the copy of the lost original is in the museum at Florence. He is credited with having wrought some of the ornamental sculpture of the tomb of Mausolus at Halicarnassus in Caria, portions of which are now deposited in the British Museum. He was more extreme than Praxiteles in his departure from the repose of the earlier Phidian manner. With him sculpture represented many of the violent emotions of life, expressed with great freedom of movement. The lines of the figure, though flexible, were made to convey vehement bodily action, and the face often wore the expression of intense feeling, as, for instance, may be noted in the lines of grief in the face of Niobe. Consult Perry's 'Greek and Roman Sculpture' (1882), and Hoppin, J. M., 'Great Epochs in Art History' (1901).

SCOPOLAMINE, skō'pō-lām'īn, or **HYOSCINE**, hī'ō-sēn ($C_{17}H_{21}NO$), an alkaloid obtained from various plants of the Solonaceæ, used in medicine as a soporific and anesthetic, and generally employed in the form of scopolamine hydrobromide ($C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O$). It is valuable as a cerebral sedative. For the relief of pain it is combined with morphine, and it heightens the effect of bromides. It is regarded as uncertain in its effects. In large doses it results in loss of memory while under its influence, a characteristic which led to its employment in the combination of drugs used to induce the condition known as "Twilight Sleep" (q.v.).

SCORE, in music the original transcript of a musical composition, with the parts for all the different voices or instruments arranged and placed in juxtaposition; so called from the practice of drawing the bar through all the parts. As a general rule the highest part should be placed uppermost, the others under it and each other, according to the lowness of the part.

All the parts of a chorus should be placed together: the soprano standing on the upper staff, the mezzo or second soprano (if any) on the one immediately below it, and so descending in the following order—contralto, second contralto (if any), tenor, second tenor (if any), bass and, lowest of all, second bass (if any). A good musician is able to form a pretty close idea of the effects the composer intends to produce by carefully reading the score. See **MUSIC**.

SCOREL, Jan van. See **SCHOORL, JAN VAN**.

SCORESBY, skōrz'bi, William, English Arctic explorer: b. Cropton, near Whitby, Yorkshire, 5 Oct. 1789; d. Torquay, Devonshire, 21 March 1857. He was the son of a whale-fisher of the same name and made his first voyage with his father in the *Dundee* when but 10, and for eight years after 1803 they made annual voyages, young Scoresby studying at the University of Edinburgh between voyages. In May 1806 in the *Resolution* they reached the highest northern latitude ($81^{\circ} 30'$) then attained. The elder Scoresby resigned his command of this ship in 1811 and was succeeded by his son, who continued the northern whaling expeditions and at the same time made observations of the electrical phenomena of the Arctic regions and it was through his reports that the government was induced to send out the Arctic expedition under Sir John Ross in 1817. In 1823 after 17 voyages to the Greenland and Spitzbergen regions he quit whalefishing, and several years later became a divinity student at Queens College, Cambridge. He was graduated in 1825, ordained in that year and subsequently held various livings and became well known for his philanthropic labors. He visited the United States in 1842 and in 1848, and made a voyage around the world in 1855-56 in the pursuit of magnetic researches. He published 'History and Description of the Arctic Regions' (2 vols., 1820); 'Journal of a Voyage' (1823); 'Discourses to Seamen' (1831); 'Magnetical Observations' (1839-52); 'Zoistic Magnetism' (1849); 'The Franklin Expedition' (1850); 'My Father: Being Records of the Adventurous Life of the Late William Scoresby, Esq.' (1851), etc. Consult his 'Life' by R. E. Scoresby-Jackson.

SCORODITE, a mineral occurring in small leek-green to reddish-brown quartzoid crystals of orthorhombic form associated with the arsenical minerals of Europe, Siberia, Brazil, Utah and many other localities. It is also found as a pale green incrustation around hot springs, occurring thus in Nevada and the Yellowstone Park.

SCORPÆNIDÆ, skōr-pē'nī-dē, a family of marine fishes, represented prominently by the California rockfish (q.v.).

SCORPIO, in astrology the "accursed constellation," the "false sign," ominous of war, discord and woe. It is of "watery triplicity," and is attended at its setting by tempests and by autumnal diseases.

In astronomy the eighth sign of the Zodiac, its symbol is ♏ . The main star of this constellation is Antares, a red star of the first magnitude, which has a green companion of the seventh.

SCORPION, arthropod animals forming the order *Scorpionida* of the class *Arachnida* (q.v.), which also includes the spiders, mites, ticks, etc. Like all other *Arachnida* the scorpions possess eight legs; but they are distinguished from the spiders by the possession of a distinctly ringed elongated tail, terminating in a hooked claw or "telson," the outlet and sting of a poison-gland situated at its base. The tail consists of a broader anterior pre-abdomen of seven segments and a slender post-abdomen of five segments and the sting, and it merges gradually into the anterior cephalothorax. There are four pairs of walking limbs borne on the thorax, a pair of large chelate pedipalpi, with crushing jaws at their bases, and a pair of small chelate or nippered jaws or *chelicerae*, corresponding to the crustacean antennæ. The genital ducts open on the basal segment of the pre-abdomen, the second segment bears a pair of comb-like sensory organs and the four succeeding segments each a pair of lamellate respiratory sacs opening by stigmata. The eyes are simple and usually consist of one pair of large ones with from two to five pairs of smaller ones.

The scorpions inhabit warm countries and some of the species of tropical Africa and South America reach a length of 10 inches. The females are said to exhibit great care for their young, and carry them on their backs for several days after being hatched, whilst they tend them carefully for about a month, when they are able to shift for themselves. Scorpions are active at night and by day live in dark places and under stones. The food consists chiefly of insects, which they seize by means of their chelæ, and sting to death. The sting is rarely fatal to man, that of the smaller temperate species not exceeding the sting of a hornet in severity, but it may prove dangerous to persons of weakly constitution. The poison is said gradually to lose its effect on man, so that the more frequently a person is stung the less noxious do the effects of the sting become. Painful effects follow the sting, such as nausea, swelling of the bitten part, etc. The remedies most to be relied upon appear to be ammonia, tobacco, ipecacuanha, etc., together with warm applications to the limb, and attention to prevent the spread of the virus, as by tying a ligature above the wound.

Among the 20 or more North American species are *Broteas alleni*, with six ocelli, of Lower California; *Vejovis carolinensis*, of the entire southern United States, with eight ocelli, and *Centrurus infamatus* of similar range.

The book-scorpions or pseudo-scorpions (*Pseudo-scorpionida*) are common small forms with short broad abdomen and no sting.

Consult Kraepelin, 'Scorpions and Pedipalpi' (Berlin 1899), and Banks, 'American Naturalist' (1900); Warburton, 'Scorpions' in 'Cambridge Natural History' (Vol. IV, New York 1909).

SCORPION-FLY, a neuropterous insect of the family *Panorpidæ*, in which the head is prolonged to form a beak. The body is long and slender. The legs are long, the tarsi being five-jointed; and two spur-like processes exist in the tibiæ or shins. They have four, multi-veined wings. The name Scorpion-fly is derived from the appendages attached to the abdomens of some species. In certain species the sixth

and seventh joints of the abdomen are attenuated and capable of extensive motion; while the last joint forms a pair of forceps resembling those of the earwigs. When at rest this tail is curled over the back, but when irritated the forceps are used as weapons of offense or defense. These insects are found chiefly in damp situations, under bushes, etc.

SCORPION-SHELL, or **SPIDER-SHELL**, one of the strombs, so called from the projecting spines with which the shells are provided. The most familiar one (*Pteroceras lambis*) is a mottled chestnut, variegated with white and orange lines. Internally its hue is pale brown and yellow. Its length is three or four inches. The orange-mouthed scorpion-shell (*P. aurantias*) is creamy white outside and orange within, and its curved spines are white and glistening. These shells are chiefly found in the Indian and Chinese seas; and the genus *Pteroceras* is represented by many fossil species, beginning in the Liassic formations.

SCORPION-SPIDER, or **FALSE SPIDER**, a small spider-like arthropod allied to the scorpion, various species of which constitute the order *Pedipalpida*. The body consists of unsegmented cephalothorax and flattened abdomen of 11 to 12 segments. The *chelicerae* are simple, the pedipalps simple or chelate, the first pair of legs terminate in a many-jointed flagellum. See **ARACHNIDA**.

SCORZONERA, a genus of composite plants with numerous species, chiefly indigenous to the Mediterranean regions. The flowers are yellow or rarely rose-colored, having many series of involucre bracts, plumose and unequal pappus, and achenes without a beak and generally wingless. *S. hispanica*, sometimes known as viper's grass, has long been cultivated for its tapering, fleshy, edible roots, the dark-brown skins of which have caused it to be called black salsify. The leaves are long and lanceolate with waving edges. Other species are also cultivated for their roots.

SCOT, skôt, or **SCOTT**, Michael, a mediæval Scottish scholar and man of science: b. probably about 1175; d. probably about 1234. He is said to have studied at the universities of Oxford, Paris and Bologna. After a period in the service of Frederick II at Palermo, he continued his studies at Toledo, where he learned Arabic. On leaving Toledo he again repaired to Sicily, where he was closely associated with the Emperor Frederick, to whom he was appointed astrologer. He took orders, and was appointed by Honorius III to the archbishopric of Cashel in Ireland, but declined the post. He was at Oxford in 1230, probably sent by Frederick to bring before the university the translations of Aristotle made by himself and others. Scot was a scholar learned in the science of time, but has been transformed by legend into a magician. As such he is referred to by Dante ('Inferno,' canto xx) and Boccaccio ('Decameron'), and he plays a prominent part in the popular superstitions of the border districts of Scotland. Many works are attributed to him, of which the following have been printed: 'Liber Physiognomiae Magistri Michaelis Scoti' (1477); a Latin translation of Aristotle's 'De Animalibus' (1496); 'Quæstio Curiosa de Natura Solis et Lunæ' (1622), on alchemy; and 'Mensa Philosophica' (1602),

anglicized as 'The Philosopher's Banquet' (1614). Consult Brown, J. W., 'Life and Legend of Michael Scot' (1897); Sir Walter Scott's notes to 'Lay of the Last Minstrel.'

SCOT, Reginald or Reynold, English writer: b. Scotshall, Kent, probably about 1538; d. 1599. He was a student at Oxford, but returned home without taking a degree and devoted himself to the study of old and obscure mystical authors and the pleasures of gardening. The work on which his reputation is founded is entitled 'The Discovery of Witchcraft' (1584), and was directed against the belief in witchcraft, alchemy, astrology and other prevalent superstitions of his time. King James I ordered the first edition of the book to be burned by the common hangman, and attempted a reply to it in his 'Demonology.' Refutations were also published by Meric Casaubon, Joseph Glanvil and others.

SCOTCH FIR, or **SCOTCH PINE**, the only pine (*Pinus sylvestris*) indigenous to Great Britain, but common all over northern Europe, especially in Scandinavia. Trunks of it dating from prehistoric times have been found in peat-bogs. It has two leaves in each sheath, and ovate cones about as long as the leaves, with cone-scales terminating in a pyramidal recurved point. The cones reach maturity in the second year. Scotch firs sometimes attain the height of 120 feet, and although conical when young become picturesque in age, with gnarled, twisted boughs covered at the extremities with dense glaucous foliage and gathered into a mushroom-like head. The straight trunk, sometimes four feet in diameter at the base, has a bright reddish-brown bark, and a heart wood of the same color, which furnishes the lumber called deal, that is nearly as durable as oak. This is so valuable, especially for shipbuilding, that the Scotch pine is extensively planted; naval stores, also, are made from the abundant resin, and the sap-wood, while more perishable than the heart, is used for agricultural purposes, railway sleepers and paving blocks. The bark will serve for tanning.

SCOTCH LAW, the system of jurisprudence and judicial practice as developed in Scotland. Ancient Scotch law bore a marked resemblance to the law of England, but changes rapidly developed so that the two systems differed to a considerable extent as early as the end of the 16th century. Shortly before this the Court of Session, which had been established more than a century before, was abolished and another court, known as the College of Justice, was substituted. The system of legal procedure adopted by this court was modeled after the Roman law, and the judges showed a marked preference for Roman substantive law also. As a result the differences between Scotch and English law grew greater as time progressed, and although in recent years legislation has brought the legal systems of both countries more into harmony, there still exists considerable divergence in procedure, substantive law and terminology. For instance, the term "pursuer" as used in Scotch law is equivalent to "prosecutor" or "plaintiff" in English law. The pleading of the pursuer in criminal actions setting forth the material grounds of the action is called the "condescendence." Offenses are divided into two classes:

"delicts" and "quasi-delicts," nearly resembling torts in English law. Cases often occur in which it is almost impossible to differentiate between delicts and quasi-delicts. Scotch law divides property into heritable and movable, in marked contrast with English law, which divides it into real and personal. Contracts by the Scotch classification are divided into three classes: Real, consensual and quasi-contracts. A consideration is not essential to the validity of an unsealed contract. "Process" has a much wider application than in English law, being practically equivalent to "practice" or "procedure." In the law of sales, no distinction is made between conditions and warranties, and the statute of frauds has no application. The law of divorce differs considerably from that of England, the consent of parents not being essential to the validity of marriages of minors; an absolute divorce may be secured by either party for mere desertion (called non-adherence), as well as for adultery, in which latter case the parties may both remarry except with the paramour if mentioned in the decree. Formerly jurisdiction in divorce proceedings was vested in a body of commissaries, but by statute this was changed so that it now vests in the Court of Session.

In Scotland few crimes are constituted by statute, the common law being so construed that if a judge directs an act to be a crime and a jury convicts, such act is a crime. In the past this has served as an instrument of political oppression, but such is apparently not its effect to-day. The summons goes into considerable detail, and is regulated by the Act of 1850. The practice of including the grounds of the action in the summons has been discontinued, such grounds now being contained in the condescendence and pursuer's plea in law annexed to the summons. The usual form of accusation is by indictment drawn by the public prosecutor, and ordinarily a grand jury is impaneled in cases of treason only. Private prosecutions are rare. The old procedure by criminal letters has been abolished. A copy of the indictment, with a list of the witnesses, must be served on the defendant. An action in the Court of Session now commences with a summons by the pursuer. The statement of the defender is called his defenses. The procedure in this court was amended by the Court of Session Act of 1868. The pleadings in the Sheriff's Court are similar to those in the Court of Session, and the procedure is governed by the Sheriff Courts of Scotland Act of 1876. One of the distinctive characteristics of Scotch criminal law is the "not proven" verdict of the jury, which corresponds to the *non-liquet* of the Roman law, and which is permissible in certain cases. In legal effect it is equivalent to "not guilty," and bars any further action on the same charge, but it falls far short of an acquittal on the reputation of the defendant. Criminal procedure in Scotland was much simplified by an act passed in 1887.

The ordinary appellate tribunal in Scotland for decisions of superior courts and of the lords ordinary is the Court of Session, sitting in two divisions. In criminal cases appeals from inferior courts go to the Court of Session sitting in the High Court of Justiciary. Since the year 1707 the House of Lords has been the final appellate tribunal for Scottish

civil causes, but has never acted in criminal cases.

The Court of Admiralty of Scotland was continued at the Union in 1707 for the determination of all maritime cases within the jurisdiction of that court, but in 1830 its civil jurisdiction was transferred to the Court of Session and the Sheriff's Court. The last-named court has also limited criminal jurisdiction.

Jury trials were first used in Scotland for certain forms of civil cases in the 19th century, but are not frequent to-day.

EDWARD F. DONOVAN,

Formerly Editor 'Unabridged Standard Dictionary,' 'Standard Bible Dictionary,' etc.

SCOTCH MUSIC. Much conjectural matter has been written about the origin of Scotch music, discussing, among other questions, whether it was the creation of one of the artist favorites of James III, or was brought over and naturalized by David Rizzio. That much of it is as old at least as the 16th century was proved by a manuscript collection of the tunes in a handwriting and notation which brought them close back to that period. This collection, known as the 'Skene Manuscript,' was edited by a man of scholarly attainments who had devoted himself to musical study—William Dauney, F.S.A., Scotland. His conclusions on their value as preserving the music of the country in its original purity are "The favorable contrast which many of the Scotch airs therein contained present to the dull, tiresome, meretricious productions which from time to time have been palmed off upon the public under that name, and the vitiated copies of the same tunes which have been handed down by tradition alone, are the most gratifying results of its discovery. We are now no longer at a loss for a standard by which we can test the genuineness of our national music, distinguishing the true from the false, the pure ore from all admixture of baser metal." One of the most prominent features of the Scottish music is the prevalent omission of the fourth and seventh in the scale, and the consequent absence of all semitones; another is the substitution of the descending for the ascending sixth and seventh of the minor scale. Modulation often takes place between the major key and its relative minor, and the melody keeps ever true to the diatonic scale of the principal key, no accidentals being introduced. Many airs open in the major key and close on the minor. Closes are not confined to the tonic, and are found on the third, fifth and sixth, and in Highland music on the second of a major and the seventh of a minor key. Consult Thomson, G., ed., 'Melodies of Scotland, with symphonies and accompaniments, by Pleyel, Kozeluch, Haydn, Beethoven, Hummel and Weber' (6 vols. 1793-1841); Graham, G. F., 'The Songs of Scotland,' and Fulcher, 'Lays and Lyrics of Scotland' (Glasgow 1870).

SCOTCH TERRIER. See DOG; TERRIER.

SCOTER, or SURF DUCK, a duck of the genus *Edemia*, characterized by a broad short bill curiously swollen, bright-colored at the base of the upper mandible and with a hooked nail. These are the most marine of all ducks, though the American species may also occur about the Great Lakes, etc. They are comparatively weak

fliers but expert divers and feed chiefly upon mollusks and other animals, for which they dive and grope in the mud of shallow waters. The males of all the species are uniformly velvety black, with or without white markings on the head and wings, and with bright colors on the bill. The females are plain brownish above, grayish below, with dull-colored bills. There are three common American species; the black scoter (*Æ. americana*), the white-winged scoter (*Æ. delandii*), and the surf duck or sea coot (*Æ. perspicillata*), and the European species occasionally wander into our territory. All of this species breed in the far North and winter within the United States as far south as New Jersey and Chesapeake Bay on the Atlantic and California on the Pacific side. A few may linger through the summer in Maine, etc.; and the second species is the most abundant. The flesh is unpalatable on account of its strong fishy taste; but this quality permits its being eaten by Roman Catholics on fast-days.

SCOTIA, skō'sha, N. Y., village in Schenectady County, on the north bank of the Mohawk River, three miles northwest of Schenectady, on the New York Central and the Boston and Maine railroads. It is situated in a dairying region and is chiefly a residential town. It was settled in 1758. Pop. 2,957.

SCOTIA SEMINARY, an institution for the education of Negro girls located at Concord, N. C. It was founded in 1880 under the auspices of the Presbyterian Board of Missions for Freedmen. There are four departments of study, the Normal and Scientific Department, the Grammar School, the Preparatory Department (elementary grade) and the Industrial Department. Instruction in music is also given; physical training and instruction in hygiene, principles of ventilation, etc., form a part of the curriculum. The normal course extends over two years and the scientific course continues one year longer and includes instruction in Latin, geometry, astronomy, rhetoric, civil government, nursing, mental science and ethics. Manual training is a part of the whole course; in the lower classes (Grammar Department); this training is given chiefly by the students doing the work in the boarding department; for the higher classes there are courses in cooking, household economy and sewing. No tuition is charged except for instruction in music; the institution is largely supported by the Presbyterian Board of Missions. The library contains more than 2,500 volumes. The students in 1903-04 numbered 291; the faculty 18.

SCOTISM, the philosophical and theological system founded by Joannes Duns Scotus, toward the close of the 13th century and which in succeeding centuries was the greatest of the systems opposed to that of Thomas Aquinas. Scholastic philosophy was the philosophy of Aristotle interpreted, developed and reconciled with the Christian faith. In the latter part of the Middle Ages, scholastic theology, accepting the data of Catholic faith, occupied itself in arranging, defending and drawing deductions from them on the principles of scholastic philosophy. Of this scholastic philosophy and theology, there were two great schools, of which the Thomist found its home in the Dominican, the Scotist in the Franciscan, order. The Nominal-

ist school found adherents in both of these orders and in the Church generally, but never exercised an influence like that of the older systems, and really marks the decay of Scholasticism as a whole. The principles of Scotism are stated in the 'Opus Oxoniense' and the commentary 'The Four Books of the Sentences,' written by Scotus at Oxford. His whole philosophical and theological teaching is here in collected form. Scotists no less than Thomists were, in the strictest sense of the word, scholastics. The one as well as the other accepted the whole tradition of the Church as it was collected by Peter Lombard; to Scotus no less than to Saint Thomas the Pope is the supreme guardian and divinely instituted exponent of the deposit of faith left to the Church, the highest guide and ruler of the Christian commonwealth. Again Scotus, as well as Thomas, accepts Aristotle as the representative of human reason, the decisive authority in philosophical discussion. The Scotists were greater Realists than the Thomists. To the Thomists no universal exists as such. The essence is only actually found in the individual; it is by a process of the intellect—abstraction—that we separate humanity in general from humanity as it manifests itself in a particular man and reach the idea of man in general. To the Scotists the nature in all individuals of the same species was numerically one. The obvious difficulties of this theory led later Scotists to modify it till it was scarcely discernible from Thomism. The Scotists believed that in individuals there was an "Læc-eitas," something which made them individual apart from matter; also "the created will is the total and immediate cause of its volition, so that God in respect thereto has no immediate but only mediate efficacy." The will is like a "free horse," grace like the rider, and the horse can throw its rider; otherwise, the will could not be free, and there would be no possibility of sin. Scotism denies the possibility of proving by reason the immortality of the soul; claims that the Word would have become man, even had there been no fall; that the merits of Christ were not infinite in themselves and from the union of his human nature with the Word, but only from the acceptance of them as infinite on the part of God. Consequently, the system denies the infinite value of the sacrifice of the Mass. The Scotist teaching in regard to the sacraments differed greatly from the Thomist position, admitting only a moral efficacy instead of the physical efficacy taught by the latter. Thomism denied the indifference of any deliberate action while the Scotists reject this reasoning, and hold that the end, and, therefore, the action, might be indifferent. The Scotist philosophy and theology are now abandoned but many of its opinions have been adopted. The Scotist opinion on the Immaculate Conception finally triumphed, and its theory on the Incarnation has recommended itself, as a philosophical view of that mystery, even to writers of note outside the Church. Consult Werner, 'Scholastik des späteren mittelalters' (Vol. I, Vienna 1881), from which this article is principally taken, 'The Catholic Encyclopedia' (New York 1910).

SCOTISTS. See SCOTUS, JOHN DUNS; SCHOLASTICISM

SCOTLAND, skôt'land, **UNITED KINGDOM**, the northern division of the island of Great Britain, extending between lat. 54° 38' and 58° 40' 30" N., and long. 1° 46' and 6° 8' 30" W. It is separated from England substantially by the Solway, Cheviots and Tweed, the border isthmus being about 60 miles across; but the irregular boundary line, the historic Border-land, measuring fully 100 miles. On all other sides it is bounded by the sea. The greatest length, from north-northeast to south-southwest, between Dunnet Head and the Mull of Galloway, is 287 miles. The breadth varies from 140 miles to less than 30, the latter in the north, between Dornoch Firth and Loch Broom. Few points in the mainland are more than 40 miles from the sea, the country being deeply penetrated by inlets. The country was formerly divided into a number of districts, many of the names of which are still familiar, such as Lothian, Tweeddale, Galloway, Breadalbane, etc., but for political purposes it is divided into shires or counties, as may be seen in the following table. Edinburgh (the capital), Glasgow, Dundee and Aberdeen each contain upward of 100,000 inhabitants. After these come, in order of population, Paisley, Leith, Greenock, Coatbridge, Kilmarnock, Kirkcaldy, Perth, Hamilton, Motherwell and Falkirk.

Islands and Coasts.—The islands of Scotland are said to number altogether nearly 800. On the east coast they are few and small; but on the northeast are the two large groups, the Orkneys and Shetlands, the former numbering 52 islands, 28 permanently inhabited; the latter 100 islands, 29 inhabited; while on the west coast the islands are large and numerous. Here the Hebrides (q.v.) extend for

200 miles from north to south, and are divided into the Inner and Outer Hebrides, the former lying close to the western coast of the mainland and stretching from Skye to Islay; the latter, parted from the Inner Hebrides by the straits of the Minch and the Little Minch, comprise the long chain of islands from Lewis to Benbecula. Enclosed in the Firth of Clyde are the islands of Arran, Bute and the Cumbraes, forming a county by themselves. The west coast of the mainland is generally a wild, deeply indented mountain-wall, presenting a series of inlets or sea lochs, while toward the middle the coast is cleft by two great inlets with openings to the southwest, the Firth of Lorn and its continuation Loch Linnhe, and the Firth of Clyde and its ramifications running far inland. The east coast is sometimes low and sandy, but is often formed by steep rocky cliffs of considerable elevation, the chief inlets being the Firths of Forth and Tay, and the Moray Firth, Cromarty Firth, etc.

Orography.—From the configuration and geological structure the country divides into three divisions, the Highlands, Central Lowlands and Southern Uplands. The first of these divisions lies north of a line stretching in a southwesterly direction from the coast of Kincardineshire to the Firth of Clyde; the third is the country south of a line drawn from Dunbar southwesterly to Girvan; the country between these lines forms the Central Lowlands. The Highland division is remarkable for the number and elevation of its mountain-masses, many of the summits being over 4,000 feet high. The mountains best known by name are the Grampians, which form a system or series of masses covering a large area and culminating on the west coast in Ben Nevis, 4,406 feet high; while 55 miles to the northeast rises a remarkable cluster of summits reaching in Ben Macdhui the height of 4,296 feet. The Grampians and their connections are separated from the mountains farther to the north by Glenmore or the Great Glen of Scotland, a remarkable depression stretching quite across the country from sea to sea, and forming, by the series of lakes occupying it and the Caledonian Canal connecting them, a waterway from the west coast to the east. The Southern Uplands are also essentially a mountainous region, summits of over 2,000 feet being frequent, though none exceed 3,000 feet above the sea. The central region, though much less elevated than the other two divisions, has none of the monotony usual in flat countries. Though occupying not more than a sixth of the whole surface, the fertility of the soil and its mineral treasures make this part by far the wealthiest and most populous. The present form of the land surface of Scotland is the effect of erosion or denudation. The country was at one time an elevated table-land, the upper surface of which is indicated by the summits of the mountain-masses, but has been deeply trenched and furrowed in all directions by the erosive action of water, ice and frost. The slope of the ancient plateau is determined by the direction of the principal river; in the northern part it is chiefly toward the east, in the southern more equally east and west.

Hydrography.—The chief rivers flowing east to the German Ocean are the Tweed, Forth,

Tay, South Esk, North Esk, Dee, Don, Deveron, Spey, Findhorn, etc.; those entering the sea on the west are the Clyde, Ayr, Doon, Dee, Nith, Annan and Esk. The Clyde in its lower course carries a vast traffic, this being rendered possible chiefly by dredging. Many of the rivers are valuable from the numbers of salmon they produce. A striking feature of the country is the great multitude of lakes varying in size from Loch Lomond (28 square miles) to the pool-like mountain tarns. In the Northern Highlands almost every glen has its lake and every mountain hollow is filled by a stream or spring. Among the more noted are lochs Lomond, Katrine, Tay, Earn, Rannoch, Awe, Shiel, Laggan, Lochy, Ness, Maree, Shin, in the Western and Northern Highlands; Loch Leven, in the Central Lowlands; and Saint Mary's Loch, lochs Ken, Dee and Doon in the Southern Uplands.

Geology.—The older or Palæozoic rocks predominate almost everywhere in Scotland. The Highlands are composed almost entirely of crystalline schists, gneiss and quartzites; the Central Lowlands of Old Red Sandstone, Carboniferous and Permian strata; the Southern Uplands mostly of rocks of Silurian Age. In certain localities remains of secondary formations are represented over small spaces, while volcanic rocks cover considerable areas. Granite exists in great masses in many localities, and in some parts is extensively quarried. The most valuable mineral region is the Central Lowlands, where coal and iron exist in such quantity as to make this one of the most important mineral fields of Great Britain.

Agriculture.—Oats form the principal cereal crop, and is the only crop available on the moist oceanic border. Wheat is grown in the Lothians, Fife and the Merse of Berwick, where the average number of bushels to the acre is the largest in Great Britain. Barley, potatoes and roots are other crops of the east coast. The average crop of roots in Scotland amounts to half that of England. Important fruit-growing districts are the Carse of Gowrie and around Blairgowrie and Coupar-Angus. The mountain pastures of the Southern Uplands and the Lower Highland hillsides support sheep. Notable breeds of cattle are the Ayrshire, a dairy breed, black-polled Aberdeen, Angus, a beef stock, West Highlanders and black-polled Galloways. Clydesdale is the originator of a famous breed of horses. The average acreage under crops is about 5,100,000 acres. The yield of oats in 1917 was 41,321,568 bushels, barley, 9,103,204 bushels; turnips and swedes, 8,000,000 long tons; potatoes, 1,000,000 long tons. There are about 8,000,000 sheep in the country and about 1,000,000 cattle. In 1916 there were 76,754 holdings, of which 2,558 contained over 300 acres, 23,227 from 50 to 300 acres, 32,985 from 5 to 50 acres, and 17,984 from 1 to 5 acres.

Mining.—The mineral region of Scotland is the Central Lowland. The largest coal fields lie in Lanarkshire, which produces over 40 per cent of the total output, Ayrshire, Fife, the Lothians and Stirling. The iron fields lie near the coal, in the counties of Ayr, Lanark, Linlithgow, Renfrew, Fife, Midlothian and Stirling. Oil shale is mined round Edinburgh and Linlithgow. Other important mineral prod-

ucts are the red and gray granite of Aberdeenshire, limestone, found principally in Fife and Midlothian; slate of Argyll and Perth; and lead, fire-clay, etc. Coal production in 1917 reached 35,596,800 tons; oil shale, 3,000,000 tons; iron, 675,000 tons. The total value of all mineral products in the same year was \$106,320,000.

Manufactures.—The most important industries are those of textiles, metals and machinery, and shipbuilding. Glasgow is the chief seat of all industries. The cotton industry centres chiefly in Glasgow and Paisley, the latter being noted for its thread. The woollen manufacture is settled in Stirling, Kilmarnock, Bannockburn and Paisley, while the wool produced on the Southern Uplands, combined with the presence of water as a motive-power, has helped to locate the manufacture of woollen cloths in the Tweed-Valley towns of Hawick, Galashiels and Selkirk. The linen industry first began in Forfarshire, at Glamis, in 1790, and has since remained in several Forfar towns, such as Dundee, which also specializes in jute, Arbroath, Brechin and Forfar. In Fife, Dunfermline specializes in damask, and Kircaldy in linoleum, Airdrie, Coatbridge, Falkirk, Kilmarnock and Hamilton smelt and work iron. Glasgow turns out machinery of all descriptions, and Kilmarnock makes locomotives and rolling-stock. Shipbuilding centres in Glasgow, Port Glasgow, Greenock, Patrick, Govan and Dumbarton. This industry is also pursued to a smaller extent on the east coast. A special quality in the water has in each case assisted in developing paper manufacture in Midlothian, while Edinburgh, next to London, is the greatest printing centre in the United Kingdom, and in Aberdeenshire, whisky distilling and dyeing at Perth and Dumbarton are important industries. Sugar-refining and tobacco manufacture are carried on at Glasgow. The annual value of the output of the textile factories is about \$200,000,000. Shipbuilders before the war turned out an average of 500 vessels annually, aggregating about 900,000 tons. Since the war this production has been vastly increased but the censorship renders it impossible to give the production figures. The war has also greatly affected the production of distilled spirits, which formerly reached the staggering annual total of about 25,000,000 gallons. This has been greatly curtailed.

Commerce.—The indented coast of Scotland and its deep inrunning estuaries have greatly favored the development of commerce, as has the fact that the producing areas on the Central Lowland are either actually on or quite close to the maritime outlets. The western ports trade chiefly with America, the west of England and Ireland; the eastern ports chiefly with the Netherlands, Hamburg and the Baltic. The commercial connection with Ireland and the West is shown by a large import into the Clyde ports of bacon, ham, grain, flour, tobacco, livestock, leather, lard, timber, iron ore. Representing foreign imports in the eastern parts are butter, grain and flour, eggs, linen, yarn and timber, all principally from Russia and other Baltic countries. The exports in either case are identical in character with British exports generally. The value of all imports is about \$275,000,000 annually and the exports reach about the same amount, although

the latter have been greatly curtailed during the war. See GREAT BRITAIN—COMMERCE.

Communications.—Railway lines reach Edinburgh and Glasgow from the south by skirting round the Southern Uplands through the eastern edge of plain-land, and, by means of river valleys, penetrating the heart of the Southern Uplands themselves. While the flat country between Edinburgh and Glasgow has made railway construction easy. Northward, connection from Glasgow and Edinburgh is provided by the North British Railway, which crosses the Forth and Tay by two magnificent bridges, and runs along the flat coastal sill to Aberdeen, whence the Great Northern of Scotland carries it on to Elgin and to Inverness. Another north route is by the Caledonian Railway, which enters Strathmore through the gap between the Campsie Falls and Ochils, and continues through Perth and Forfar, to the coast at Montrose, whence it runs on to Aberdeen. The Highland Railroad from Perth penetrates up the valley of the Tay and of the Garry to Inverness, whence it continues north to Wick and Thurso. The total railway mileage is 3,871. Scotland possesses three canals. The Caledonian connects the nearly continuous line of lochs which fill Glenmore, and is used principally for tourist traffic, as is the Crinan Canal across the peninsula of Kintyre. A deep depression secured the construction of the Forth and Clyde Canal (1790) between Bowling and Grangemouth.

Finance.—The Scottish fiscal system is part of that of the United Kingdom. Scotland's annual contribution to the revenues is about \$100,000,000, made up of the excise tax, income tax, estate dues, customs, land taxes, etc. The non-tax revenue from postal, telegraph and telephone service amounts to about \$14,000,000 yearly. See GREAT BRITAIN—NATIONAL FINANCES.

Population.—In 1801 the official census showed the population numbered 1,608,420. In the following half-century it had increased to 2,888,742, and in 1901 it stood at 4,472,103. In 1911 it reached 4,760,904, and the estimate for 1915 was 4,785,598. Of these 75 per cent live in towns of 1,000 or more inhabitants; about 8 per cent are non-Scots, mostly Irish and English. Previous to the war about 50,000 emigrated annually to the colonies and the United States.

Fisheries.—Both the freshwater and sea fisheries of Scotland are important, especially on the eastern coast. Aberdeen is the chief fishing centre; others are Peterhead, Wick, and, on the west coast, Stornoway. The chief food fishes are herring, especially those of Loch Fyne; haddock, flat fish, notably Forth flounders, and cod. In recent years sail-boats have been superseded by motor-boats and steam-fishing vessels. About 100,000 are employed in the industry; the value of the catch in 1917 exceeded \$20,000,000.

Religion.—The strongest religious body in Scotland is the Presbyterian, the established branch of which has a membership of about 725,000 distributed among 1,450 churches. The second largest religious body is the Roman Catholic with 525,000 adherents, next comes the United Free Church of Scotland with 510,-

000 members. The Episcopal Church is represented by about 54,000 members.

Political Constitution.—The Parliament of Scotland anciently comprised, till the reign of James VI, all who held any portion of land, however small, from the Crown by tenure of military service when the small barons or freeholders were excused from attendance in person, "two or more wise men" being deputed from each county in proportion to its size. Its powers were nominally extensive, but the supreme power was virtually in the king, who by his influence often entirely controlled its proceedings. The Parliament on the whole consisted of three estates—the nobility, the dignified clergy (consisting of bishops, abbots and priors), and the lesser barons, or representatives of shires and burghs. When Presbyterianism was formally ratified by law after the Revolution of 1688, the ecclesiastical estate ceased to have a place in Parliament. Every measure brought before Parliament was previously prepared by a committee, styled the lords of the articles, chosen from each of the three orders, but in effect little better than royal nominees. Before the Union there were four great officers of state—the lord high-chancellor, the high-treasurer, the lord privy-seal and the secretary; and there were also four lesser officers—the lord clerk-register, the lord-advocate, the treasurer-depute and the justice-clerk. Previously to the era of the revolution the Privy-Council of Scotland assumed inquisitorial powers, and even torture was administered under the sanction of its authority; but it is now entirely merged in the privy-council of Great Britain. The number of peers in the Scottish parliament was latterly 160, and of commons 155, and all sat in one house, and voted promiscuously. At the union of the kingdoms the political system of Scotland was almost entirely incorporated with that of England. See GREAT BRITAIN—PARLIAMENT.

The Court of Session is the supreme civil court of Scotland. The Court of Justiciary, or criminal court, composed only of judges of the Court of Session, is supreme in the highest sense, since its decisions in criminal cases are not subject to any review. The principal subordinate judicatories are sheriff-courts, established in each county or stewartry. Sheriff-substitutes, or judges ordinary, one or more holding separate courts in different districts, decide in the first instance, subject to the review of the principal sheriff or sheriff-depute, whose decisions, though final within the limits of his jurisdiction, are reviewable by the Court of Session, with the exception of classes of cases provided for by special statutes. Besides the Sheriff-Court, each county or district of a county has its justice of peace courts, in which judges, not stipendiary, decide on principles of equity in minor crimes; and in every town of any importance are bailie, dean of guild and police courts, with limited jurisdictions.

Education.—Scotland has had a national system of elementary education for over two centuries, a school having been established in every parish by a law of 1696 (where such a school was not already established), according to a system proposed by John Knox long before. This scheme did effective service for the education of the people, till the great increase

SCOTLAND SCENERY

1 Fingal's Cave

2 Duncraig Castle, Loch Carron

of population, especially in towns, rendered it unequal to the task laid upon it, and this was notwithstanding the erection of many schools by various religious denominations. By the Elementary Education Act of 1872 the Scottish Education Department was instituted, and each burgh and parish or group of parishes was required to have a school board to administer both elementary and secondary schools. Elementary education is compulsory between the ages of 5 and 14, with exemption, on conditions, for children over 12. In 1889, by a capitation grant, education was made free for the compulsory standards. In 1897 provision was made for grants in aid of voluntary schools. In 1916, 3,369 schools were in receipt of grants; these had an enrolment of 1,106,240 and an average attendance of 752,566. There are also numerous grammar or high schools and academies in every town of any size, though no systematic scheme of secondary education. Other institutions are the normal or training schools and colleges of the different religious bodies, and four universities of Edinburgh, Glasgow, Aberdeen and Saint Andrews. The first university was that of Saint Andrew, dating from 1411; next came that of Glasgow (1450), then King's College and University Aberdeen (1494), then Edinburgh University (1582), lastly Marischal College and University Aberdeen (1593). The two Aberdeen universities were united in 1860. In board-schools now education is practically free.

Civil History.—The country now called Scotland emerges from pre-historic obscurity during the Roman occupation of Britain, though for many centuries little is known of its history. It is supposed that the earliest inhabitants of the country were a non-Aryan race resembling the Iberians, and typified now by the Basques. A Celtic (and Aryan) people seem subsequently to have entered the country, and to have gained predominance over the non-Aryans, the combined people occupying at the Roman invasion most of the country north of the Forth and Clyde estuaries, which was called Caledonia (q.v.) by the Romans, and its people Caledonians. The southern part of the country was inhabited by another Celtic race, the Brythons or Britons, of the same blood as the Welsh. The descendants of the Caledonians were afterward called Picts, and were the predominant people in North Britain at the beginning of the 6th century, when a colony of Scots or Dalriads from Ireland effected a settlement in Argyll, and gradually spread over the adjacent regions. It is from these Scots (a Celtic and Gaelic-speaking people) that the country afterward received the name of Scotland, the original Scotland (Scotia) being Ireland. The Pictish tribes were divided into two great sections, the Piccardach or Southern Picts, and the Cruithne or Northern Picts. In the 9th century the Dalriadic Scots with the help of the Cruithne conquered the Southern Picts, but the Northern Picts, the ancestors of the modern Highlanders, still retained their independence. The Teutonic element was introduced into Scotland as early as the 4th century, when bands from North Germany seem to have formed settlements on the east coast south of the Firth of Forth; and this part of the country was subsequently united to the Anglian kingdom of Northumbria, which

extended from the Forth to the Humber. To the west of this kingdom, from Dumbarton to the Solway and into England, extended the kingdom of Strathclyde or Cumbria, inhabited by Romanized Britons.

About the middle of the 9th century Kenneth MacAlpin, son of a ruler of a body of Scots established in Galloway, but of Pictish descent through his mother, united in his own person the sovereignty of both the Picts and the Scots. The Norsemen had already established a footing on the islands of the north and west coasts as far south as the Isle of Man, and a Norse earldom of Orkney was established. Kenneth's kingdom comprised Central Scotland (Argyle, Perth, Angus, Mearns and Fife), with Scone as capital, the north of Scotland being mostly under independent chiefs, or maormors. The reigns of Kenneth and his immediate successors, Donald I, Constantine I, Grig, Donald II, Constantine II, Malcolm I, Kenneth II, Malcolm II, Duncan and Macbeth, were one continued warfare with the Norsemen on one hand and with the Britons of Strathclyde and the English of Northumbria on the other. Malcolm I (943-954) obtained Cumbria (Strathclyde) as a territorial fief from Edmund I, and in 1018 his grandson, Edmund II, secured Lothian, hitherto part of Northumbria, two events which materially influenced the after history of Scotland.

On the advent of Malcolm Canmore (1058) to the throne after the death of Macbeth, the able usurper and murderer of Duncan (see **MACBETH**), the purely Celtic monarchy came to an end.

The conquest of England by William of Normandy, the usurpation of the English throne by Stephen, and various other incidents of English history embroiled Scotland. Sir William Wallace (q.v.) distinguished himself in disputing the claim of Edward I to the throne of Scotland and Robert Bruce securing the independence of the country and his title to the throne by the decisive battle of Bannockburn in 1314. He was succeeded by his nephew, Robert Stewart, and he by his eldest son, Robert. He being a weak prince, the reins of government were seized by the duke of Albany, who starved to death the eldest son of the king. James, the second son, to escape a similar fate, fled to France; in the year 1424 he returned to Scotland, and having excited the jealousy of the nobility, he was assassinated in a monastery near Perth. James II, his son, an infant prince, succeeded him in 1437. He was killed by the bursting of a cannon at the siege of the castle of Roxburgh. James III ascended the throne at the age of seven years. His reign was weak and inglorious, and he was murdered in the house of a miller, whither he had fled for protection. James IV, a generous and brave prince, began his reign in 1488. He was slain at the battle of Flodden. James V, an infant of less than two years of age, succeeded to the Crown. He died in 1542, and was succeeded by his daughter, the celebrated Queen Mary, whose history and tragical end are well known (see **MARY STUART**). She was succeeded by her son James, who, in 1603, ascended the throne of England, vacant by the death of Queen Elizabeth, when the two kingdoms were united into one great monarchy which was legislatively

united in 1707. A joint commission was appointed to draw up articles of union in 1706. The Scottish Parliament met to consider the articles, which encountered a strong opposition headed by the duke of Hamilton, and strongly backed up by the bulk of the people. A majority of the parliament, however, carried the measure, 16 Jan. 1707; it received the royal assent 4 March; and the Union took effect 1 May. The chief provisions of the Act of Union were (1) that the two kingdoms should be united under the name of "Great Britain"; (2) that the succession to the crown of the United Kingdom should be in the Electress Sophia of Hanover and her heirs, being Protestants; (3) that 16 Scottish peers and 45 Scottish members of the House of Commons should be elected to the one parliament sitting in London; (4) that the Established Presbyterian Church of Scotland should be maintained; (5) that Scotland should keep unchanged her own laws and customs relating to property and private rights, and also the Court of Session and other Scotch courts; (6) that all the rights of trade, free intercourse and citizenship should be the same for Scotch and English subjects. Henceforth the general history of Scotland may be said to be entirely identified with that of England.

SCOTLAND, Language and Literature of.

I. Language.—Previous to 1400, the term "Scottis," i.e., Scottish or Scots was used in Scotland exclusively to refer to Gaelic, the language of the Celtic inhabitants of the north and west; the speech of the Lowlands being then and for a century later known as English, of which it was in fact a dialect. But after 1500 it became common to speak of the Lowland tongue as "Scots," distinguishing it on the one hand from the English of the south of the Tweed, and on the other from Gaelic, which had come to be known as "Erse." In the first part of the 16th century, this Lowland Scots practically achieved the dignity of a separate national language; and though to-day its place has been taken by English in the schools, the courts, the pulpit, the press and in cultivated society, it is still, though corrupted and broken into a score of local dialects, the speech of the humbler classes in the Lowlands.

As to origin, "Scots" is in the main a development of Northumbrian, the Teutonic language spoken by the Anglian settlers in the region between the Humber and the Forth. Of the steps in this development previous to the 13th century we have, for that part of Northumbria lying north of the Tweed, little direct evidence; and when finally we find, about the beginning of the 14th century, undoubted Scottish documents, the language differs little if any from what is known as Northern Middle English. This identity is natural enough when we remember that the boundary between the kingdoms had been for centuries a shifting one, the border counties being now English, now Scottish. But after the present frontier was virtually settled, the wars over Scottish independence, the chronic estrangement which they produced between the two kingdoms and the political alliance with France, all combined to produce conditions which made probable a separate linguistic development for Scotland; so that by 1450, when the Midland dialect had practically driven all others out of the literary field in England, "Scots" (now called Middle "Scots," as distinct from the previous stage of Early "Scots" was in a fair way to independence. The flourishing of a national literature in the years between 1475 and 1550 aided this development; and in spite of the great influence of Chaucer, Gower and Lydgate, the northern tongue reached in the first half of the 16th century its point of greatest dissimilarity to English. The basis of the language remained, of course, the same as that of English, except that it was from the Northumbrian form of the parent speech that it was derived. The inflec-

tions had tended to disappear earlier in the Northern than in the Midland dialect, larger admixtures of Norse and Celtic had taken place, and, though English had absorbed more French, Scots had received independently many French words not found in the south. There was, besides, in the Scottish writers of the 16th century a strong tendency to import words direct from the Latin, and we find, especially in the courtly style of the period, a large number of barely naturalized Latinisms that found no permanent home in the vernacular.

Had nothing arisen to disturb the detachment of the two kingdoms, it seems likely that a sister language to English would have been established in the north, with distinct qualities of vigor, music and picturesqueness of its own. But the effect of the Reformation was to enable England to displace France in Scotland's foreign relations; and the influence of Protestant England on the speech of the Scottish pulpit was greatly strengthened by the acceptance in Scotland of English translations of the Bible. These forces, which have continued to work in Scotland to the present day, soon accustomed the common people to the use, if not of pure English, at least of a highly Anglicised form of Scots; and while supplying the peasantry with a polite dialect for purposes of religion and intercourse with the gentry, left the national language, now devoted to more homely uses, to become a mere patois. The moving of the Court from Edinburgh to London at the Union of the Crowns in 1603 still further accentuated the change, both by deciding that English was to be the language of high society throughout Britain, and by making clear to Scottish men of letters that, if they were to reach the larger audience, they must cultivate the language of "the predominant partner."

Thus passed the possibility of a real national language for Scotland. Various attempts to restore it were made from time to time, and with the intellectual revival in Scotland in the 18th century, Allan Ramsay, Fergusson, and finally Burns, turned once more to the vernacular as their medium of expression. But it was a greatly changed vernacular. The century and a half of the domination of English in matters of culture had reduced its scope, and broad "Scots" could be maintained only in the treatment of a limited range of subjects. Even into these, English and semi-English forms constantly intruded, and anything like a pure descendant of the pre-Reformation "Scots" of Lindsay and Douglas it is impossible to find. Though the old tradition, impoverished as it was, was valiantly upheld by Burns, and turned to artistic uses with amazing success, yet with Burns the account is practically closed. He has had many imitators; other authors of Scottish birth have written in the dialect; but we are not again to have a "Scots" writer using the old tongue as his normal literary medium. The race of the "makars" is ended, and the dialects into which the old speech has disintegrated have crept into corners to die.

II. Literature.—Few vestiges of the earliest writings in "Scots" have survived. Some fragments of patriotic verse have come down from the troublous times following the death of Alexander III, but the earliest name is that of Thomas the Rhymer of Erceldoune, a shadowy figure long regarded as a prophet. He seems

to have flourished in the end of the 13th century, and is himself the hero of the romance of 'Thomas of Erceldoune.' His name is connected with the Northern romance of 'Sir Tristram'; but no general agreement has yet been reached as to the probability of his authorship. The poem itself is a paraphrase from the French, written in an elaborate stanza but without great poetic distinction. Somewhat later than Thomas, but hardly less shadowy, is another supposed writer of romance, Huchown of the Awle Ryale, who, according to Wyntoun,

"Made the gret gest off Arthure
And the Awntyre off Gawaine,
The Pystyll als off Swete Swsane."

The last of these is easily identified with a version of the story of Susanna and the Elders, written in a difficult stanza with interlacing rhymes and alliteration. But the relation of the extant poems on Arthur and Gawain to those mentioned by Wyntoun is a puzzle yet unsolved, as is also the identity of Huchown himself, whom some have found in a certain Sir Hew of Eglintoun, who died in 1375. Practically all the anonymous Northern romances have been assigned to Huchown; but the absence of criteria of dialect sufficient to place these poems definitely on either side of the border makes it difficult to decide which, if any, of them should be regarded as Scottish literature.

With the author of 'The Bruce' we come out into clear daylight. John Barbour (?1320-95) was in 1357 already Archdeacon of Aberdeen, and we have record of his employment in clerical offices about the royal household. 'The Bruce,' on which he was at work in 1375, is a celebration of the life and exploits of Robert I, written in the octosyllabic couplet and in the general manner of the metrical romances. It contains much history and some—it is uncertain how much—fiction. The poet was contemporary with many who knew Bruce, and it is more than probable that much of his material was derived from eye-witnesses of the events related. His work is raised above the level of mere chronicle by the warmth of his patriotism and hero-worship and by the vividness of occasional sketches of character and incident. To the same author have been attributed fragments of a poem on Troy and a collection of saints' legends, but neither ascription is now believed to be valid.

Barbour's patriotic task was carried on in the beginning of the next century by Andrew of Wyntoun (fl. 1395-1424) in his long and uninspired 'Orygynalle Chronykil,' a history of Scotland in octosyllabic couplets, from the creation of the world to the reign of James I. A third poem with patriotic purpose is 'The Wallace,' usually attributed to Henry, a blind minstrel who flourished in the latter half of the 15th century. It is stated by the historian John Major (b. 1469) that this Henry, blind from birth, composed a book on Wallace when Major was a boy; but the manuscript of the extant 'Wallace' has no reference to Henry, and it is highly doubtful whether this is the poem alluded to by Major. Our 'Wallace' is a long poem in the heroic couplet, which claims to be based on an alleged Latin work by an unknown John Blair. It is fiercely patriotic in tone, highly unreliable as history, and full of incredible accounts of feats of the hero against the hated English. It is the chief source of the legends of

Wallace on which the patriotism of Scottish children is still fed, and in a modernized version, made by Hamilton of Gilbertfield in 1722, it continued popular into the 19th century. It is probably the earliest poem in Scots to employ the heroic couplet.

The influence of Chaucer occasionally discernible in 'The Wallace' had already made itself evident in Scotland in 'The Kingis Quair' of James I. This is a beautiful example of the conventional love-allegory of the Middle Ages, written in the seven-line stanza of Chaucer, and in a form of Scots greatly modified in imitation of Chaucer's English. The heroine is apparently Lady Jane Beaufort, whom James married at the close of his captivity in England; but precise autobiography should not be sought in an allegory. There is no more charming specimen of this type of love-poem in any English dialect; and the romantic character and tragic death of its royal author have combined with its poetic quality to give it a unique place.

Contemporary with Blind Harry was the most versatile and original poet Scotland had yet known, Robert Henryson (?1425-?1506), schoolmaster in Dunfermline. His greatest single achievement is 'The Testament of Cressid,' a continuation of Chaucer's 'Troilus.' Here in some two hundred stanzas of rhyme royal he tells of the poetic justice which overtook Cressida. The poem is smooth in versification, tender in feeling, splendidly dramatic in its treatment of the great monuments of the story, and, though less subtle in psychology than Chaucer's masterpiece, more rapid in narrative. Henryson's 13 'Fables' are the first considerable collection of the kind in any English dialect. Though the stories themselves belong to the general tradition of fable literature, they are told here in a greatly expanded form, with abundant local color, much invention of vivid detail, shrewd interpretation of character, and a lively sense of humor. In 'Robene and Makyne' Henryson appears as the first importer of the pastoral. Though the situation and names are familiar in French literature, the treatment is such as to make the little piece thoroughly Scottish. In addition to the works enumerated, Henryson wrote a number of religious and contemplative poems leaving altogether a body of work small in bulk, but surprising in its variety, originality and its higher imaginative level. There is no poet in our literature whose merits so far surpass his reputation. Probably also belonging to the 15th century are some poems whose date is difficult to fix on account of the fact that they are preserved only in a late form. Of these, 'Rauf Coilyear' is a lively offshoot of the Charlemagne cycle; and 'Peblis to the Play' and 'Christis Kirk on the Green,' rollicking pictures of rustic revelry, have been ascribed to both James I and James V.

Early Scottish poetry is generally regarded as having reached its height in William Dunbar (?1460-?1520). Most of Dunbar's life was spent about the court of James IV, where he remained in the hope, never fulfilled, of receiving a fat benefice. He wrote in two styles which may as a rule be fairly easily distinguished. In the one, his "aureate" style, are composed his courtly allegories, complimentary addresses, and devotional poems; in the other, his satirical and humorous poems. The aureate style is laden with Latin words of the type of

"celsitude" and "pulchritude," often coined for the occasion; and the versification, especially in its rhyme schemes, is often very elaborate. Among the most notable in this style is 'The Goldyn Targe,' a prettily worked-out allegory of the Court of Love type, differing from the mass of poems of its kind chiefly by the firm hold kept by the poet on the psychological signification of his symbols and personifications. 'The Thrissil and the Rois' belongs to the same class, and celebrates the marriage of James IV to Margaret Tudor. Of the poems written in the broader vernacular, the most extreme is the 'Flyting' with Andrew Kennedy, a contemporary poet who has left but a few poems besides his share in this duel. The poem belongs to the class of scurrilous invective common in Italy during the Renaissance, and is coarse and revolting beyond expression. Equally strong in vernacular flavor is 'The Dance of the Sevin Deidly Synnes' a vividly grotesque picture of the lower world. Dunbar's 'Dregy' is of the familiar mediæval type of the parody upon religious services, and is carried out with more humor than reverence. The many poems on abuses in the court, the sessions, and the Church, lose interest for the modern reader on account of the ephemeral nature of their themes; but both these and the devotional poems habitually exhibit technical mastery. Perhaps the greatest single achievement of Dunbar is 'The Lament for the Makars,' a stately and melancholy chant written in time of sickness, lamenting the mortality of the race of poets. It is in four-line stanzas, each concluding with the sombre Latin refrain, 'Timor mortis conturbat me.' Belonging to the older tradition of unrhymed alliterative verse, 'The Twa Merrit Wemen and the Wedo' is a cynical but extremely lively and indecorous sketch, probably inspired by the Prologue to Chaucer's 'Wife of Bath's Tale.' The most notable quality of Dunbar's work in point of content is its reality, the sense of immediate contact with life; in point of form, the quite extraordinary variety and skill shown in the versification, and the brilliance and point of the diction.

Gavin Douglas (1475-1522) was the third son of Archibald, Earl of Angus. Like Dunbar, he was a churchman, but of far different fortunes. Provost of Saint Giles in Edinburgh and later Bishop of Dunkeld, he was led by his family connections into various political and diplomatic activities, and the fall of his house from power led to the loss of his bishopric and his exile. He died in London of the plague. His 'Palice of Honour' is the most elaborate specimen of the allegory in Scots, and it exhibits most of the vices of its kind. It abounds in descriptions of pagan deities in procession and of wonderful gardens and castles, written in fluent verse decorated with copious "aureate" terms; and the classical element is varied by a suffusion of Catholic theology and morality. But the style lacks fire, and the allegory itself is rambling and incoherent. 'King Hart,' the ascription of which to Douglas is usually though not universally accepted, is a shorter production of the same general type, more directly didactic in aim, but also much clearer in conception. But Douglas's fame depends chiefly upon his translation into heroic couplets of the 12 books of the 'Æneid,' with the addition of the supplementary book by

Maphæus Vegius, and original prologues to each book. The work is notable as the first complete translation of a classical poem into verse in Britain, and is in itself no small achievement. Some of the prologues are remarkable for highly realistic descriptions of nature, in which the "catalogue" method is carried to an extreme.

The last notable figure of the group carries us down almost to the date of the Scottish Reformation. Sir David Lindsay of the Mount (1490-1555) became attached to the royal household while still a young man, apparently as some kind of entertainer; and in 1512 he was appointed attendant to the infant King James V. Later he was knighted and made Lyon King at Arms, an office which carried with it, besides heraldic and diplomatic functions, the supervision of court fêtes. His poetry begins with 'The Dreame' (1528), an allegorical vision in rhyme royal, combining science with the exposure of contemporary abuses. 'The Complaynt to the King' (1529) presents a request for reward in the manner of Dunbar, recalls the poet's early intimacy with the king, and criticises his advisers. 'The Testament and Complaynt of our Soverane Lordes Papyngo' (1530) contains much political matter and some very frank satire on the priesthood. 'An Answer to the Kingis Flyting' shows Lindsay engaged in a political altercation with his master, scarcely less scurrilous than that between Dunbar and Kennedy. Satire on the court appears also in the 'Complaynt of the Kingis auld Hound'; 'The Jousting between Watson and Barbour' ridicules a mock tournament between two court physicians; the 'Deploration of the Death of Queen Magdalene' is an official production on conventional lines; 'Kitteis Confession,' an amusing attack on the Confessional; 'Ane Supplication againis Syde Taillis,' a witty if coarse satire on feminine fashions. 'The Tragedy of the Cardinal' (1547) is a virulent attack on Cardinal Beaton, lately murdered. 'The Historie of Squire Meldrum,' the freest of his poems from satire or didacticism, is a narrative of the martial and amorous adventures of a contemporary laird, modeled on the mediæval metrical romance, and exhibiting a lighter touch and more charm than anything else of Lindsay's. His last work, the 'Dialogue concerning the Monarchie' is a long and tedious production dealing with the history of the world and the kingdoms thereof from the Creation to the Day of Judgment. But by far the most important of his works is his 'Satyre of the Thrie Estaitis,' a vigorous Morality with interspersed Interludes, satirizing the various abuses under which Scotland suffered, with special stress on the corruption of the clergy, and offering abundant advice to the king, before whom it was acted in 1540. From this enumeration of his works it will have appeared that Lindsay was much more a reformer than an artist. But his vigor and sincerity, his earnestness and outspokenness, not only made him a powerful force in the overthrow of the Catholic Church in Scotland, but enabled him alone of the pre-Reformation poets to remain popular in the following centuries. Over 50 editions of his works, in whole or in part, have been issued since his death.

In spite of the absorbing interest of religious controversy, there existed a group of poets in

Scotland in the second half of the 16th century who wrote on other themes. Alexander Scott (1547-84) is almost exclusively a love-poet; and his 36 surviving pieces exhibit such technical skill in versification and so much genuine lyrical power as to make him, in this respect, the most worthy predecessor of Burns. Alexander Montgomerie (?1540-?1610), his disciple, worked under the further influence of that movement in English poetry which is represented by Tottel's 'Miscellany,' as is seen by the frequency of the sonnet among his verse-forms. He seems to have invented the peculiar 14-line stanza, imitated by Ramsay and Burns, known by the name of the first poem written in it, 'The Banks of Helicon.' His more popular poem, 'The Cherry and the Slae,' is in the same form; and he experimented largely in other stanzas. His chief subjects were love, nature and religion; and he added one more to the list of Scottish flytings. More interesting than the work of the minor writers of the period such as Maitland, Sempill and James VI is the book of 'Gude and Godlie Ballates,' a remarkable collection of Protestant verses, many of them violently controversial, written to the tune and often parodying the words of popular secular songs, and intended for purposes of propaganda. Most of them are ascribed to James and John Wedderburn, whose brother Robert wrote anti-Papist plays.

Of literature in vernacular prose, Scotland has little to boast. Most of that written before 1600 is translation, the most important being the anonymous 'Complaynt of Scotlande.' This curious work was written by a strong partisan of the French as opposed to the English alliance, and the scheme of the allegory on which the political part of the work is based is adapted from 'Le Quadrilogue Invectif' of Alain Chartier. More original than this serious setting forth of the woes of Scotland and their remedies is an inserted 'Monolog Recreative' containing a mass of curious description, with lists of popular songs, tales and dances, used by a group of shepherds. The works of Knox and his followers and opponents belong to religious controversy rather than to literature; and most of the writings of George Buchanan (q.v.), the great Scottish humanist, were in Latin. Through the whole period so far discussed flourished the traditional Ballads (q.v.), which vie in interest and value with the works of the known authors.

In the period following the Union of the Crowns, the most important men of letters such as Sir Robert Aytoun, William Alexander, Earl of Stirling and Drummond of Hawthornden, wrote in English. One family, the Sempills of Beltrees, kept up the vernacular tradition, and Sir Robert (?1595-?1660) revived in 'The Life and Death of Habbie Simson' the six-line stanza which has come to be the recognized vehicle for Scottish elegy. Most of the songs of this period are anonymous, but the names of Lady Grizel Baillie, Lady Wardlaw and Hamilton of Gilbertfield show that the dialect could still be written by the upper classes. Hamilton is the chief link between the Sempills and Allan Ramsay (1686-1758), whose work both as a poet and as a collector marks the definite revival of the vernacular. Ramsay first a wig-maker and then a bookseller as well as a poet, and we owe much to his enterprise in issuing his two collections, 'The Tea-Table Miscellany' con-

taining songs old and new, Scots and English, and 'The Evergreen,' selections of Scots verse, chiefly from the Bannatyne manuscript. He wrote himself many songs, tales and fables, his most popular work being the pastoral drama, 'The Gentle Shepherd.' The corruption of the later Scots is abundantly exemplified in Ramsay's diction; and the substance and tone of his poems suffer from an analogous defect in the mixture of Scots and English influences. Yet his songs were undeniably popular; he had some gift of comedy and satire; and he gained through his pastoral a prominent position in that field. As an editor he helped to preserve older poetry which might otherwise have been lost, and to revive interest in the national literature; but his methods were those of his time, and he amended and "improved" ruthlessly.

Ramsay's activity was followed by the production of many good songs by a variety of writers, but none of the importance of Robert Fergusson (1750-74), a youth of genius, whose career in too many respects foreshadowed that of Burns. He sought relief in conviviality from the drudgery of a clerkship, fell a victim to religious melancholy, and died mad at 24. In his Scots verse Fergusson carried on the national tradition both as to language and versification, and displayed gifts not only of wit and humor but of genuine poetry, and a sense of style much surpassing Ramsay's. In his poems Burns found inspiration and models for some of his most popular productions; and he has left in poems like 'Auld Reekie' a vivid picture of the Edinburgh of his day.

In the achievement of Robert Burns (q.v.) Scottish poetry reached its climax and virtually its conclusion. A few poets whose lives overlapped his have been hailed by their respective admirers as his successors. Joanna Baillie (1762-1851) wrote some good humorous songs; Caroline Oliphant, Baroness Nairne (1766-1845), sang with poignancy the pathos of the lost Jacobite cause; and James Hogg, the Ettrick Shepherd (1770-1835), her rival in Jacobite lyric, attempted a much more ambitious task in 'The Queen's Wake.' Two at least of the poems in this composite and uneven work are worthy of remembrance, the delicate and charming 'Kilmeny,' and the weirdly humorous 'Witch o' Wife.' Many song-writers must be left unmentioned here. Scott, Stevenson and their successors wrote occasional vernacular lyrics and introduced vernacular dialogue into their novels, but the day for the spontaneous and complete use of Scots as a medium of expression by Scottish men of letters is past.

Bibliography.—The authoritative account of the origins and development of the Scots language is Dr. J. A. H. Murray's 'Dialect of the Southern Counties of Scotland' (London 1873). Consult also Smith, G. G., 'Specimens of Middle Scots with glossary' (Edinburgh 1902). For the literature, Dr. Irving's 'History of Scottish Poetry' has been largely superseded by T. F. Henderson's 'Scottish Vernacular Literature' (rev. ed., Edinburgh 1910), and the 'Literary History of Scotland,' by J. H. Millar (New York 1903). Dr. J. M. Ross's 'Scottish History and Literature to the Period of the Reformation' (Glasgow 1884) and Hugh

Walker's 'Three Centuries of Scottish Literature,' from the Reformation to Scott (2 vols, Glasgow 1893), taken together give a fairly complete view of the subject. Most of the works of the earlier writers are now accessible in the publications of the Scottish Text Society; and the 'Famous Scots' Series supplies biographies, of very varying value, of all the more notable writers.

WILLIAM A. NEILSON,
Professor of English, Harvard University.

SCOTT, sköt, Austin, American college president: b. Maumee, Ohio, 10 Aug. 1848. He was graduated from Yale in 1869, and later became private secretary to George Bancroft, the historian. After serving as instructor in German at the University of Michigan, and associate professor in history in Johns Hopkins, he assisted Bancroft in collecting and arranging material for his 'Constitutional History.' In 1883 he was called to Rutgers College, where he taught in the departments of history and political economy until he became its president in 1890-96, when he again assumed his professorial duties.

SCOTT, Charles, American soldier: b. Cumberland County, Va., 1733; d. 22 Oct. 1813. He served under Braddock in 1755 as a non-commissioned officer, and at the outbreak of the American War for Independence he raised and commanded the first company raised south of the James River. He was promoted colonel in 1776, was prominent at the battle of Trenton in 1777, and was promoted brigadier-general. He served in the two subsequent New Jersey campaigns, and under Gen. Anthony Wayne at Stony Point in 1779. He was taken prisoner in 1780 and was held until nearly the end of the war. He then settled in Woodford County, Va., and later saw service in Indian wars. He served under General St. Clair in 1791 and under General Wayne at the battle of Fallen Timbers later in the same year. In 1808-12 he was governor of Kentucky.

SCOTT, Charles Felton, American electrical engineer: b. Athens County, Ohio, 19 Sept. 1864. He was graduated at the Ohio State University in 1885, and later studied at Johns Hopkins University. He was engaged as an electrical engineer in 1888-1911, since when he has been professor of electrical engineering at the Sheffield Scientific School, Yale.

SCOTT, Clement, English author and journalist: b. London, 6 Oct. 1841; d. 25 June 1904. He was educated at Marlborough College and became widely known as a dramatic critic to the *Daily Telegraph* in 1873. Previous to his editorship of *The Free Lance* he was a well-known writer upon the staff of the *Sunday Times*, the *Weekly Dispatch*, the *London Figaro*, and other publications of note, and in 1880 became the editor of the *Theatre*, a London magazine. While not a great dramatic critic, he became a leader of popular opinion in things theatrical. He was the author of 'Lays and Lyrics'; 'Thirty Years at the Play'; 'From the Bells to King Arthur'; 'The Wheel of Life'; 'Madonna Mia,' and 'The Drama of Yesterday and To-Day'; 'Sisters by the Sea'; 'Ellen Terry.'

SCOTT, David, Scottish painter: b. Edinburgh, 10 Oct. 1806; d. there, 5 March 1859. He

early determined to become a painter, and began by drawing vignettes and frontispieces for books. In 1827 he formed an association with some artists, who founded the Life Academy for the study of the living model. The following year he exhibited his first picture, 'The Hopes of Early Genius Dispelled by Death,' 'The Combat of Fingal with the Spirit of Lodi,' 'Sarpedon Carried by Sleep and Death,' 'Monograms of Man,' and other works painted between 1828 and 1832 indicated the wild and incoherent character of his genius, and the numerous large canvases which he filled with tireless industry and enthusiasm quite failed in producing the effect he anticipated, his pictures being grandly conceived, but wanting in color and finish. In 1841 he exhibited what has generally been considered his greatest picture, 'Vasco de Gama Encountering the Spirit of the Storm at the Cape,' which was subsequently purchased for the Trinity House at Leith. His whole career was an arduous struggle, not with absolute failure, but with a success far from adequate to his aspirations, and he must be looked upon as the Scottish counterpart of Haydon.

SCOTT, Dred, American negro slave: b. Missouri, about 1810; d. after 1857. See **DRED SCOTT CASE**.

SCOTT, Duncan Campbell, Canadian poet: b. Ottawa, Ontario, 2 Aug. 1862. He was educated at Stanstead Wesleyan College, and entered the Canadian civil service in 1879, becoming chief accountant in 1893. Besides his contributions of verse to the current periodicals, he has published in verse 'The Magic House' (1893); 'Labour and the Angel' (1898); 'New World Lyrics and Ballads' (1905); 'Via Borealis' (1906), and in prose, 'The Village of Viger,' a collection of stories (1896); 'John Graves Simcoe' (1905), in the 'Makers of Canada' series.

SCOTT, Eben Greenough, American author: b. Wilkesbarre, Pa., 15 June 1836. He was graduated from Yale in 1858, and is the author of 'Interstate Law of Pennsylvania'; 'Development of Constitutional Liberty,' and 'Reconstruction During the Civil War.'

SCOTT, Fred Newton, American educator and authority on English: b. Terre Haute, Ind., 20 Aug. 1860. He was graduated at the University of Michigan in 1884, and has since been associated with the faculty of that university, becoming professor of rhetoric there in 1901. He was university editor in 1897-1900. He edited many classic and standard works, is joint author of 'Guide to the Literature of Æsthetics' (1890); and of numerous textbooks on the English language. Author of 'Æsthetics, Its Problems and Principles' (1890); 'Principles of Style' (1890), etc.

SCOTT, Sir George Gilbert, English architect: b. Gawcott, near Buckingham, 13 July 1811; d. London, 27 March 1878. While still a youth he was placed by his father in the office of an architect, where his tastes drew him mainly to the study of Gothic architecture. The Martyrs' Memorial, erected at Oxford in 1841, was the first work which brought him into notice. It was followed by the new church at Camberwell, and in the same year he was the successful competitor for the rebuilding of the church of

Saint Nicholas at Hamburg, which had been destroyed by fire. Among his other designs are included the cathedral church of Saint John's, Newfoundland; Glasgow University; Leeds Infirmary; chapels at Exeter College, Oxford, and Saint John's College, Cambridge; the Memorial to the Prince Consort, London; Saint Mary's Cathedral at Edinburgh, etc. Toward the close of his life he was engaged in carrying out the restoration of the cathedral at Saint Albans. Among the restorations accomplished by him are those of many English cathedrals. He was the author of 'Plea for the Faithful Restoration of Our Ancient Churches' (1850); 'Conservation of Ancient Architectural Monuments' (1864); 'Lectures on the Rise and Development of Mediæval Architecture' (1878); 'Personal and Professional Recollections' (1879).

SCOTT, Harvey W., American editor: b. Tazewell County, Ill., 1 Feb. 1838; d. 7 Aug. 1910. He removed to Oregon in 1852, and in 1865 became editor and chief owner of the *Portland Oregonian*. He made that newspaper the leader among the Pacific Coast papers, while his sturdy independence of policy and clear, forceful writing made him as an editor a political power. The *Oregonian* stood for the gold standard in the election of 1896 and Scott had the satisfaction of seeing Oregon carried by the Republicans, the only Pacific Coast not registering its vote against the gold standard.

SCOTT, Hugh Lenox, American military officer: b. Danville, Ky., 22 Sept. 1853. He was graduated from the United States Military Academy 14 June 1876 and was commissioned second lieutenant 15 June 1876; first lieutenant 28 June 1878; captain of cavalry 24 Jan. 1895; major and assistant adjutant-general, United States Volunteers, 12 May 1898; lieutenant-colonel and assistant adjutant-general, United States Volunteers, 17 Aug. 1899; major 25 Feb. 1903. Served in Sioux expedition, 1876; Nez Percé expedition, 1877; Camp Robinson, Nebraska and Cheyenne expedition, 1878; subsequently performed routine duty, principally with the Indians of the Plains, 1878-91; honorable mention from War Department, 1891; in charge investigation of Ghost Dance disturbances, 1890-91; enlisted and commanded Kiowa, Comanche and Apache Indians, troop L, seventh cavalry, 1892, until mustered out after five years' enlistment (last Indian troop mustered out); in charge of Geronimo's band of Chiricahua Apaches, 1894-97. On duty at Bureau of Ethnology, Smithsonian Institution, writing work on sign language, Plains Indians, North America, November 1897, until outbreak of Spanish War. He served as adjutant-general of Second and Third Divisions of First army corps, May 1898 to February 1899; adjutant-general, Department of Havana, under General Ludlow, March 1899, to May 1900; adjutant-general of the Division of Cuba until November 15, when the Division of Cuba was changed to Department of Cuba; adjutant-general of Department of Cuba 1900-02, and acting governor-general of Cuba; took part in turning over the government of Cuba to the Cubans, 20 May 1902; was on duty with General Wood winding up the affairs of the Military Government of Intervention in Cuba, 1902. He served in the Philippines, 1903-06, in the establishment of civil gov-

ernment, as governor and commander of troops in Sulu Archipelago; the conquest and pacification of the Sulu Archipelago and brought about the abolishment of slavery and the slave trade therein.

On 31 Aug. 1906, he was appointed superintendent of the United States Military Academy, with rank of colonel, and served as such until 31 Aug. 1910. On 3 March 1911, he was commissioned lieutenant-colonel of cavalry, and on 18 Aug. 1911, he reached, in due course of promotion, the rank of colonel, and was assigned to command of the Third cavalry. In November 1911, he was sent by the Secretary of War on a special mission to New Mexico and Arizona to adjust Indian troubles; on 23 March 1913 was promoted to rank of brigadier-general. During year April 1913 to April 1914, he commanded the United States troops on southern border from Texas to California, at time of our difficulties with Mexico. On the breaking out of severe troubles with the Navajo Indians on Beautiful Mountain, Arizona, November 1913, he was sent there with four troops of cavalry and was so successful in settling a difficult situation that he received the commendation of both the President and the Secretary of War. On 22 April 1914, he was appointed assistant chief-of-staff, and on 17 November of same year became chief-of-staff. In January 1915 he settled by diplomacy the impending conflict on the Mexican border at Naco, Arizona. In March 1915, he settled the Piute Indian trouble at Bluff, Utah. On 30 April 1915 he was promoted to rank of major-general. In August 1915, he was sent down to the Mexican border on a special mission, and was successful in recovering property of foreigners in Mexico confiscated by General Villa. In 1917 he was a member of the United States Commission to Russia and on 26 Dec. 1917 was made commander of the 78th Division of the National Army at Camp Dix, Wrightstown, N. J. In March 1918 he was made commander of Camp Dix. In 1910 he received the L.H.D. degree from Princeton University, and in 1915 the LL.D. degree from Columbia College. General Scott is a member of the Geological Society of America, American Anthropological Association, Historical Society of Texas, Historical Society of North and South Dakota, Society of Moro Campaigns, Society of American Wars, Military Order of Foreign Wars, and Society of the Spanish-American War. He is author of various monographs and reports relating to the Plains Indians.

SCOTT, Hugh Stowell, English novelist, known by the *nom-de-plume* "HENRY SETON MERRIMAN": b. Newcastle-on-Tyne, 1862; d. Ipswich, 10 Nov. 1903. He was a short while in business, made numerous sea voyages, finally devoted himself wholly to literature, and from the appearance of his novel 'The Phantom Future' in 1889 wrote a long series of somewhat melodramatic works of fiction, particularly successful when dealing with Russia and Nihilistic plots. His best book was perhaps 'The Sowers' (1896). Others are 'Suspense' (1890); 'With Edged Tools' (1894); 'Flotsam' (1896); 'Roden's Corner' (1898); 'The Isle of Unrest' (1900); 'The Vultures' (1902).

SCOTT, John Morin, American soldier and legislator: b. New York, 1730; d. there, 14

Sept. 1784. He was graduated at Yale University in 1746, and engaged in practice in New York. He was an early supporter of American rights against the British Crown, was one of the Sons of Liberty and an advocate of extreme measures. He was a leading member of the New York General Committee in 1775, and a delegate to the Provincial Congress in that year. In 1776 he was appointed brigadier-general in the Continental Army, and he participated in the battle of Long Island. He was secretary of State for New York in 1777-79, and served in Congress in 1780-83.

SCOTT, Julian, American artist: b. Johnson, Vt., 14 Feb. 1846; d. Plainfield, N. J., 4 July 1901. He entered the Northern army in 1861 and while in service made his mark by his sketches of hospital life. He entered the National Academy, New York, in 1863, and subsequently studied under Emmanuel Leutze. He became an associate of the Academy in 1871. His pictures are largely scenes of army life, such as 'Rear-Guard at White Oak Swamp' (1869-70), owned by Union League Club; 'Battle of Cedar Creek' (1871-72, at the State-house, Montpelier, Vt.); 'Battle of Golding's Farm' (1871); 'The Recall' (1872); 'On Board the Hartford' (1874); 'Duel of Burr and Hamilton' (1876); 'Reserves Awaiting Orders' (1877); 'In the Cornfield at Antietam' (1879); 'Charge at Petersburg' (1882); 'The War is Over' (1885); 'The Blue and the Gray' (1886); 'Death of General Sedgwick,' in the Plainfield (N. J.) Public Library.

SCOTT, Levi, American Methodist Episcopal bishop: b. Odessa, Del., 11 Oct. 1802; d. there, 13 July 1882. He was chiefly self-educated, was licensed as a local preacher in 1826 and in 1834-36 he was presiding elder of the Philadelphia Conference. He was principal of the Dickinson Grammar School in 1840-42, and was connected with the Methodist Book Concern, New York, in 1848-52. In 1852 he was elected and ordained bishop.

SCOTT, Orange, American clergyman: b. Brookfield, Vt., 13 Feb. 1800; d. Newark, N. J., 31 July 1847. He entered the New England Conference of the Methodist Episcopal ministry in 1822; was presiding elder of the Springfield, Mass., district in 1830-34, and of the Providence, R. I., district in 1834-35. From 1833 he was a zealous anti-slavery worker, and failing to receive the support of his bishop he withdrew from the Church in 1842. In 1843 he organized the Wesleyan Methodist Church at Utica, N. Y., becoming its president. He was editor of the *True Wesleyan*, an anti-slavery and anti-episcopal publication, in 1842-44. Failing health compelled his retirement from the ministry in 1846. Author of 'An Appeal to the Methodist Episcopal Church' (1838).

SCOTT, Sir Richard William, Canadian statesman: b. Prescott, Ontario, 24 Feb. 1825; d. Ottawa, 23 April 1913. He was admitted to the bar in 1848; was mayor of Ottawa in 1852; was elected a member of the Canadian assembly in 1857-63, and of the Ottawa assembly in 1867-73, where he was speaker in 1871-73. He was also member of council and commissioner of the Crown lands of Ottawa in 1871-73. He was a member of the Dominion Senate from 1874, and was Secretary of State

in 1874-78 and again in 1896-1908. He secured the enactment of the separate school act for the province of Ontario, and the Canadian temperance law known as the "Scott Act." He was knighted in 1909.

SCOTT, Robert Falcon, English naval officer and Antarctic explorer: b. Outlands, Devenport, 6 June 1868; d. Antarctic regions, 29 March 1912. He was educated at Stubbington, Fareham, and entered the navy in 1882. He became interested in Antarctic exploration and in 1900 after his promotion to commander he began preparations for his first exploring tour. In 1901-04 he commanded the Royal Geographic Antarctic Expedition, discovered Edward VII Land and reached the farthest point south then penetrated, lat. 82° 17', long. 163°. Returning in 1904 his achievements were highly acclaimed. He was appointed naval assistant to the First Lord of the Admiralty in March 1909 but resigned later in that year to make preparations for his second journey of exploration in the Antarctic regions. He set out in 1910 on the *Terra Nova*, and established headquarters at MacMurdo Sound late in that year. (See ANTARCTIC REGIONS—*Exploration*). With four others in the party making the last part of the journey he reached the South Pole 18 Jan. 1912, after the longest sledge journey ever made, 1,842 miles. Here awaited him the bitter disappointment of the discovery that Amundsen had gained the Pole five weeks earlier. Scott photographed the tent surmounted by the Swedish flag left by Amundsen and carried with him the letter to King Haakon according to the request left by his victorious rival. Scott's observation placed the pole only one-half mile from the point selected by Amundsen, and he planted the British flag there, made the necessary observations and set out upon the return journey. From the first ill-fortune dogged them; two of the party succumbed while Scott and the other two reached a point but 11 miles from One Ton Base and 155 miles from MacMurdo Sound on 20 March, with provisions for two days. They were held there by a blizzard and all died of hunger and exposure 29 March. Scott wrote in his diary until the last day, completing his records and leaving letters to the families of his companions, his own family, friends and officers, all stamped with matchless spirit. His observations of the expedition were in excellent order and of high scientific value. These and his diary were later published in the same style as his account of the first journey. The bodies of Scott, Wilson and Bowers were recovered in the spring of 1913. The officers of the navy contributed the funds for a bronze monument of Scott executed by his wife—who after his death was by Royal order known as Lady Scott—at Waterloo Place, London, in 1915. Author of 'Voyage of the Discovery' (2 vols., 1905); 'Scott's Last Expedition' (posthumous, 2 vols., 1913).

SCOTT, Robert Kingston, American soldier and governor: b. Armstrong County, Pa., 8 July 1826; d. Napoleon, Ohio, 13 Aug. 1900. He studied medicine and engaged in practice in Henry County, Ohio, in 1851-57, later entering the mercantile business. In 1861 he was commissioned lieutenant-colonel in the 68th Ohio regiment, and in 1862 he was promoted

colonel. He took part in the campaigns in Tennessee and Mississippi, and was commissioned brigadier-general of volunteers 12 Jan. 1865. He was assistant commissioner of the Freedman's Bureau in South Carolina in 1865-68 and was elected governor of South Carolina in 1868 and in 1870. He was charged in 1871 with being party to a fraudulent overissue of State bonds, but cleared himself and defeated the movement to impeach him. His administration was further complicated by the activities of the Ku-Klux-Klan, which compelled him to appeal to President Grant for United States troops to put down the disorder. He removed to Napoleon, Ohio, upon retiring from office, and in 1880 he shot and killed Warren G. Drury, but was acquitted on the grounds that it was accidental.

SCOTT, Thomas, English Anglican clergyman and Bible commentator: b. Braytoft, Lincolnshire, 4 Feb. 1747; d. Aston Sandford, Buckinghamshire, 16 April 1821. Possessing a strong love for learning he obtained a wide knowledge of both Latin and Greek, and in 1773 took orders in the Church of England. Through his friendship with John Newton he became an ardent Calvinist, defending Calvinism both in the pulpit and in the public press. He was chaplain of the Lock Chapel, London, in 1785-1801, and was then appointed rector of Aston Sandford, where he remained until his death. His reputation rests chiefly on his 'Commentary on the Bible' (1788-92), of which it is estimated that 100,000 copies have been sold. His other publications include 'The Force of Truth' (1779); 'Remarks on the Bishop of Lincoln's Refutation of Calvinism' (1812), etc. His collected 'Theological Works' were published (5 vols., 1805-08; 10 vols., 1823-25).

SCOTT, Thomas Alexander, American railway manager: b. London, Pa., 28 Dec. 1824; d. Darby, Pa., 21 May 1881. He entered the service of the Pennsylvania Railroad in 1850; became its general superintendent in 1858, and its vice-president in 1859. His services as superintendent of all government railroads and telegraph lines at the beginning of the Civil War placed him in the ranks of men of extraordinary ability, from which he was appointed Assistant Secretary of War in August 1861. This post he resigned in the following June, but re-entered the government service later and achieved distinction in the rapid construction of railroad lines necessary to the relief of General Rosecrans at Chattanooga. Again entering the service of the Pennsylvania Railroad, he inaugurated the policy of securing control of Western railway lines for the purpose of operating them in conjunction with the Pennsylvania lines. From 1874-80 he was president of the Pennsylvania and at various times of other lines.

SCOTT, Sir Walter, Scotch poet and novelist: b. Edinburgh, 15 Aug. 1771; d. Abbotsford, 21 Sept. 1832. He was the ninth child of Walter Scott, a writer to the Signet (lawyer), who belonged to the strenuous Border clan of Buccleugh, and of Anne Rutherford, a representative of another famous family. There were 11 other children, six of whom died in infancy. Walter at the age of 18 months suffered from spinal meningitis which caused a permanent

lameness of his right leg. On account of this he was early sent to the country, where he learned to love nature. Later his imagination was impressed by a journey to Bath and London. At the age of seven he was entered at the school in Edinburgh, where he displayed a love of sport and of good reading, though no great aptitude for hard, systematic study. For a short time he was at school at Kelso, where he formed his friendship with James Ballantyne. All accounts show that he was a manly, attractive boy who loved stories, poems like 'The Faerie Queene,' ballads and family legends.

In November 1783 he entered the University of Edinburgh, where his course was impeded by illness and his desultory habits were not overcome. His knowledge of the classics was slight, but he learned something of the chief Romance literatures and, while riding or walking for his health, he laid the foundations of his immense stock of antiquarian learning. In 1786 he was apprenticed to his father and, strength having come to him, he developed systematic habits of labor. He attended law lectures and debating clubs and in 1792 was called to the bar; but his interest in literature and history was no less than it had been, and he enjoyed the convivial society of his fellow law students. Despite his lameness, he was tall, strong, athletic and manly in appearance, full of life and merri-ment, and attractive to both sexes. An early attachment to a pretty young woman was to be expected, but impediments presented themselves and Scott was left with memories which bore witness to what is thought to have been "the strongest passion of his life."

His early work at the bar did not interfere with his making excursions into the Highlands and along the Border, which added to his stock of ballads and legends and gave him an extraordinary insight into the character of his countrymen. The life with which he came in contact had its seamy side, especially with respect to intemperance, but his was a romantic temperament that was not to be contaminated. A new interest also came to him in 1792, when, with his friend William Erskine, he began to study German. A few years later he attempted a paraphrase translation of Bürger's 'Lenore,' which he was persuaded to print along with another imitation of a ballad by the same author. This led to an introduction to "Monk" Lewis (q.v.), who brought about the publication in 1799 of Scott's translation of Goethe's 'Götz,' and persuaded his young friend to write some more ballads. Having thus had a taste of the pleasure of writing and publishing, though his success was far from dazzling, the young lawyer made plans to have his collection of ballads printed by his friend Ballantyne.

Meanwhile, his income from his profession had increased, and he had fallen in love with the attractive daughter of a French refugee, Charlotte Mary Carpenter (Charpentier). She had a small income settled on her, so that marriage did not seem a rash step. They took it in December 1797 and lived together congenially, although it does not appear that she was a specially qualified helpmate. In 1799 Scott was appointed sheriff-depute of Selkirkshire with a salary of £300 and few duties. Soon after, he prosecuted with energy the task of editing and publishing his important 'Minstrelsy of the Scottish Border,' the first two volumes of which

appeared in 1802, the third in 1803. This contained some imitations of the old ballads, but fortunately did not include a narrative poem on the legend of Gilpin Horner, that was at first intended for it. The excluded poem, written in the free measure of 'Christabel' which a friend had recited to Scott, was slowly elaborated into 'The Lay of the Last Minstrel,' which was published early in 1805 and achieved great success. Here the creative genius of Scott first manifested itself in marked powers of narration, characterization and description, though scarcely in what may be called the strictly poetic gifts of high imagination, inevitable phrasing and noble harmony.

He now determined to follow literature seriously, but also to secure a more definite income than could be had from that or from his not specially brilliant work at the bar. With this end in view he undertook to perform the reportorial duties of an infirm clerk of session, who was to keep the emoluments of the office till his death or, as it turned out, until he was pensioned. Six years later (1812) Scott came into the comfortable salary of £1,300, but he had given much time to the clerkship and had done in addition work that would have worn out any less herculean constitution. He took some interest in politics, became a partner in James Ballantyne's printing business, proposed publishing schemes, wrote articles and edited books, working early in the morning, took rides (especially when he was at his beautiful home of Ashiestiel near Selkirk), answered correspondents faithfully and yet found time for reading and study. There is scarcely another such energetic and copious genius of a high order in several spheres to be found in the annals of English literature.

His most important creative works during this period were 'Marmion' (1808) and 'The Lady of the Lake' (1810), which increased his fame as a poet; but they represent only a small part of his labors. He edited 'Dryden' in 18 volumes (1808), prefixing an elaborate biography; he superintended a new edition of the 'Somers Tracts' in 13 volumes, to say nothing of about eight smaller undertakings of a similar kind; he helped to establish *The Quarterly Review*, and he formed an unlucky partnership with John Ballantyne, brother of James, to conduct a publishing business. If they could have confined themselves to publishing Scott's poetry, even after the unenthusiastic reception of 'Rokeby' (1813) showed Scott that he could not successfully rival Byron and that his own talents must be exercised in another sphere, the partners, despite John Ballantyne's unbusinesslike habits, might have made a passable success; but Scott thought himself a born promoter and literary adviser, and he was generous to a fault with authors who were his friends. Miss Seward's works, Beaumont and Fletcher's plays edited by Weber, *The Edinburgh Annual Register* and other undertakings fell so flat it seemed best in 1813 to wind up the publishing business.

These difficulties were tided over by loans and by the transfer of more or less worthless books to the publisher Archibald Constable, and the success of the "Waverley" novels for some years made Scott feel more confident of his financial position than a prudent man should have felt. His was, indeed, a glorious genius

SIR WALTER SCOTT

with a splendid energy to match, but he had also costly tastes which he aspired to gratify on a magnificent scale. His social position meant much more to him than his fame as a writer, and to maintain and increase that position he thought that he must acquire large estates and dispense a profuse hospitality. He began to realize his dream in 1812 when he bought the small farm of Abbotsford. Then he added one piece of land after another until he had spent about £30,000; he built himself a castle, and he lived on a scale which, in view of his tangled affairs, even his large income did not justify. It was only the discovery of his incomparable gifts for prose romance that his financial ruin was postponed for so long.

Early in July 1814, just after the edition of Swift in 19 volumes marked the culmination of Scott's career as an editor though not as a critic, the romance 'Waverley, or 'tis Sixty Years Since,' an anonymous story dealing with the period of the Young Pretender, made its appearance and took the novel-reading world by something like a storm, six editions being needed before the close of the year. Scott had begun the tale as far back as 1805, the year of the 'Lay,' but Erskine and James Ballantyne, who wanted another well-paying poem, discouraged his attempt, and the easy-tempered author put it aside. In 1808 his attention was again directed to historical fiction through the fact that he undertook to prepare for the press an unfinished romance by the antiquary Joseph Strutt, entitled 'Queenhoo Hall.' He had always had a faculty for narrative and had enjoyed the tales and novels of others, especially, in recent years, the Irish stories of Miss Edgeworth (q.v.). We have already seen that the comparative waning of his poetic fame before that of Byron—illustrated by the failure of 'The Bridal of Triermain' (1813) which was anonymous, and to be confirmed later by the reception of 'The Lord of the Isles' (1815) and of 'Harold the Dauntless' (1817)—led him to think that he must transfer his energy to other fields, and he would probably have tried prose fiction again, sooner or later, even if a famous accident had not recalled his early attempt to his mind. One day at the end of 1813, while searching for some fishing tackle, he found the manuscript of his forgotten tale in a drawer. He read it over and determined to complete it. This time Erskine had the good sense to approve his friend's experiment, and Scott, writing with his phenomenal steadiness and rapidity, finished the last two-thirds of the book in three weeks. He did not put his name to it, partly for fear of losing some of his reputation if it failed, partly because novels were still looked upon in the main as an inferior form of literature in which a dignified officer like a clerk of session would not be expected to dabble.

Of course his fears proved to be ill-founded and there was no necessity for his preserving his anonymity, but he seems to have liked the mystery involved, and perhaps he thought that by remaining "The Great Unknown" he appeared to be less of a professional man of letters and in consequence more of a country gentleman of high standing. There have been squeamish people who could not easily forgive Scott for his innocent deceptions and his failure to come out into the open as a proud representa-

tive of his art; but it is not difficult to understand him and it seems idle to be irritated with him. After all, he did not succeed thoroughly in his attempt to remain anonymous, for competent critics like John Wilson (q.v.) saw in the author of the novels the man who had written the poems and edited the ballads. The matter was enough discussed, however, to lead to the writing of J. L. Adolphus's 'Letters' to Heber on the Waverley Novels and the question of their authorship (1821), but even after this unmasking Scott continued to wear his tenuous disguise for about six years.

'Waverley' was followed shortly by 'Guy Mannering,' which illustrated his genius as a painter of Scotch life and a revealer of Scotch character—especially in the lower ranks of life. Like its predecessor it was dashed off, but was none the less immensely successful. Scott was delighted, particularly as money began to flow in and he was thus enabled to pay obligations and buy more land. He visited London and was over-enchanted at the flattering reception given him by the Prince Regent; but then Scott was a born Tory and consequently not likely to see the spots in a royal sun. His cordial relations with Byron were much more to his credit, especially as he championed that unfortunate poet when all England was crying out upon him. Later he visited Waterloo and met Wellington, who greatly impressed him. The literary results of this tour, 'Paul's Letters to His Kinsfolk' and 'The Field of Waterloo,' a poem, were failures; yet Scott was a great martial poet, would probably have been a soldier if he had not been lame and could scarcely have had a more congenial subject. Fortunately no decline was visible in 'The Antiquary'; and in 'Old Mortality,' which came later in 1816, forming with 'The Black Dwarf' the first series of 'Tales of My Landlord,' Scott produced a story which in construction, characterization, historical imagination and sympathy, power of description and broad human interest, ranks deservedly, not only very high in the list of his own creations, but as one of the masterpieces of English fiction. The style is not flawless, the psychology is not penetrating, the art in general is less subtle and refined than that to which the novelists who have followed in Scott's wake have accustomed us; but in the essential points of wholesomeness and truth to nature and of large, copious, equable creative powers, Scott, as his influence upon other lands and generations plainly shows, has little reason to fear comparison with any of his successors.

At the close of 1817 'Rob Roy' followed and six months later came 'The Heart of Midlothian,' which to many readers marks the culmination of Scott's genius as a novelist. The public responded heartily to every fresh appeal, but, unfortunately, Scott's popularity was used as a club to force publishers to take over the worthless stock of his publishing firm, and Scott and the Ballantynes were inextricably involved with Constable, who finally became Scott's sole publisher and dragged him down in his own failure. Meanwhile, the tragic 'Bride of Lammermoor,' which appealed so deeply to the sombre genius of Poe, and 'The Legend of Montrose' appeared in 1819, despite the fact that Scott had suffered tortures from a stomachic trouble. The heroic way in which he dictated the 'Bride' to Laidlaw and John

Ballantyne is well known, as is also the fact that, when he got up from an illness which it was feared would prove fatal, he could not recall "a single incident, character or conversation" in the story. Yet such was his pluck that he not only began a new book, but actually branched out into a new type of novel by crossing the border and throwing his scene back into a remote past. 'Ivanhoe,' for so this important venture was named, appeared at the close of 1819 and may be regarded, not as the best, but as the most popular of all Scott's works and as the one which made him a favorite and a great influence throughout Europe. The brilliance of its descriptions and the thrilling interest of its plot continue to atone for the carelessness of its construction and the untrustworthiness of its representation of the epoch in which its scene is laid.

Scott was now at the height of his literary and his social renown. In 1820 he accepted a baronetcy from George IV—he had previously declined the laureateship—and published 'The Monastery' and 'The Abbot.' The next year came the popular 'Kenilworth' and 'The Pirate,' followed in 1822 by 'The Fortunes of Nigel,' and in 1823 by 'Peveril of the Peak.' A stroke that seemed apoplectic did not affect the power of that masterly portrayal of the age of Louis XI, 'Quentin Durward' (1823), but 'Saint Ronan's Well,' a novel of contemporary manners, has never been popular, a fate shared by 'Redgauntlet' (1824) and by the first of 'The Tales of the Crusaders' (1825)—'The Betrothed.' The companion of the last named, 'The Talisman,' revealed, however, the old Scott; but despite the merits of this and of 'Ivanhoe' and 'Kenilworth' and the greatness of 'Quentin Durward,' the novels of this second period do not deserve to rank with those of the first. The stories of his period of financial ruin, 'Woodstock' (1826), 'The Fair Maid of Perth' (1828), 'Anne of Geierstein' (1829), were the work of a still vigorous and an even more heroic man; those of his complete physical breakdown, 'Count Robert of Paris' and 'Castle Dangerous' (1831), call for no criticism.

Meanwhile, the crash had come. Scott, confident in his powers, had not narrowly scrutinized his relations with the Ballantynes and Constable and, in his mania for lands and buildings and lavish hospitality, he had raised money on Constable's notes given for novels yet unwritten. A general period of depression came on and Constable failed in January 1826, bringing down with him the firm of James Ballantyne and Company, of which Scott was a partner. The result was that as Ballantyne was practically without resources, Scott felt bound in honor to pay off alone a debt of nearly £120,000. How he set to work on 'Woodstock,' how he refused all offers of help, how he made in two years, especially through his 'Life of Napoleon Buonaparte' (1827), the enormous sum of £40,000, how he bore the loss of his wife (1826) and his own infirmities, how he turned his pen to every possible task of profit—'Tales of a Grandfather' (1829) combined pleasure with profit,—how he wrote admirable prefaces for a new edition of his novels—all this is familiar to the reader of Lockhart.

Early in 1830 he had a paralytic stroke and after that his efforts to save Abbotsford, where his creditors let him continue to reside, as the seat of the family he had so longed to estab-

lish, became truly pathetic. In April 1831 he had a still more serious stroke and a little later he suffered perhaps even more acutely from the rude treatment he received from the mob at Jedburgh, where he had gone to protest against the proposed reform of Parliament. A born conservative and ever a true child of the past, it was time for him to say good-bye to a world that was entering upon a series of rapid and far-reaching changes. After his last novel had been published, it seemed that he ought to try a milder climate in order to prolong his life. The government offered him the use of a frigate; and, after a notable parting with Wordsworth, he set out for Plymouth to take it. He visited Malta, Naples and Rome, then the Tyrol and the Rhine region. At Nimeguen, on 9 June 1832, he was severely stricken and was shortly after brought home to Abbotsford, where, on the afternoon of 21 Sept. 1832, he died, surrounded by his children.

He had been what, in his last words, he told Lockhart to be—a good man. His foibles and faults—we cannot lay the whole blame for his misfortunes on the Ballantynes and Constable—when they were not those of his class and his age, were such as detracted little from the greatness of his character, and much the same thing may be said of his defects as a writer. There have been few nobler spirits in the world's history; nor is it clear that since Milton's day a more illustrious or, take him all in all, a greater writer has been born within the lands that use the English tongue. Abbotsford yields only to Stratford as a literary shrine, but it is an ironical comment on Scott's labors to aggrandize his family that no direct male heir should welcome pilgrims to it. See GUY MANNERING; HEART OF MIDLOTHIAN; IVANHOE; KENILWORTH; LADY OF THE LAKE; MARMION; OLD MORTALITY; QUENTIN DURWARD; ROB ROY; also SCOTT, LOCKHART'S LIFE OF.

Bibliography.—The standard editions of Scott's poems and novels are those in 11 and 48 volumes with his prefaces (1829-33). The miscellaneous works fill 28 volumes in the edition of 1834-36. Of the numerous later editions mention may be made of the "Cambridge Edition" of the poems edited by H. E. Scudder (1 vol.) and of the "Border Edition" of the novels (48 vols., 1892-94) with excellent introductions, by Andrew Lang. The chief authority for Scott's life is his son-in-law, J. G. Lockhart's (q.v.) admirable biography (7 vols., 1837, but best read in the Cambridge Edition, Boston, 1902). There are short lives by R. H. Hutton ('English Men of Letters'), C. D. Yonge ('Great Writers'—with a bibliography), W. H. Hudson (1901), Lang, 'Literary Lives' (1906), Saintsbury ('Famous Scots,' 1897), Norgate, G. Le G., 'Life of Sir Walter Scott' (London 1906), and others. Attention should also be given to Scott's last 'Journals' (1890) and his 'Familiar Letters' (1894) edited by David Douglas. For criticism consult Lang's biography and introductions; F. T. Palgrave's introduction to the "Globe" edition of the poems; Leslie Stephen, 'Studies of a Biographer' (Vol. II, 1898) and 'Hours in a Library' (Vol. I); Ruskin, 'Fors Clavigera' and the histories of English literature.

WILLIAM P. TRENT,
Professor of English Literature, Columbia University.

SCOTT, Walter, Canadian statesman: b. London, Ontario, 27 Oct. 1867. He was educated in the public schools, and early settled in the North West Territory, where he engaged in printing and journalism. He owned and edited various newspapers in 1892-1906, and in 1900 was elected to the Canadian House of Commons. He was instrumental in creating the provinces of Saskatchewan and Alberta in 1905, became the leader of the Liberal party in Saskatchewan and served as its first Prime Minister in 1905-17. He was also Minister of Public Works in 1905-12, and later was president of the council and Minister of Education.

SCOTT, William Amasa, American political economist: b. Clarkson, Monroe County, N. Y., 17 April 1862. He was graduated from the University of Rochester in 1886, was professor of history and political science in the University of South Dakota, 1887-90 instructor and graduate student at Johns Hopkins University, 1890-92, receiving the degree of Ph.D. from that institution in June of the latter year; assistant professor of political economy in the University of Wisconsin, 1892-93; associate professor there 1892-97 and professor 1897-1900. Since the date last named he has been director of the school of commerce and professor of political economy in that institution. In 1911 he received the honorary degree of LL.D., from the University of Rochester. He has published 'Repudiation of State Debts' (1893); 'Money and Banking' (1903; 5th ed., revised and enlarged, 1916); 'Money' (1914); 'Banking' (1914); chapter on 'The Austrian School and Recent Developments' in Ingram's 'History of Political Economy' (new and enlarged edition, 1915); Introduction to 'Recent Literature on Interest' (1884-99) by Eugen von Böhm-Bawerk, translated from the German by him in co-operation with S. Feilbogen; several articles and monographs on economic and educational topics in encyclopedias and periodicals.

SCOTT, William Bell, Scottish poet and painter, brother of David Scott (q.v.): b. Edinburgh, 12 Sept. 1811; d. Perthshire, 22 Nov. 1890. He received his first education in art from his father, who was an engraver, and in 1834 began to write poetry for the current magazines. His first picture of note, 'The Old English Ballad Singer,' was exhibited in 1838. From this time forward his reputation as a painter was established. He is best remembered, however, as a poet. While for many years he was an exhibitor in the Royal Academy, his greatest activity was along literary lines. His most noted poetical works are 'The Year of the World' (1846); 'Poems by a Painter' (1854) and 'Ballads,' etc. (1875). His other writings include 'Lectures on Art' (1861); 'Albert Dürer: His Life and Works' (1869); 'The Little Masters' (1879); 'Life and Works of David Scott.'

SCOTT, William Berryman, American geologist, brother of Gen. H. L. Scott (q.v.): b. Cincinnati, Ohio, 12 Feb. 1858. He was graduated at Princeton University in 1877, and took his Ph.D. at Heidelberg in 1880. He was associated with the Princeton faculty from 1883 and from 1884 was professor of geology and palæontology there. He conducted the Princeton expeditions in Patagonia and was joint editor of the reports of the expeditions

(8 vols.). He has written numerous monographs on geology and palæontology and is author of 'Introduction to Geology' (1897; 2d ed., 1907); 'History of Land Mammals of the Western Hemisphere' (1913); 'The Theory of Evolution' (1917).

SCOTT, Winfield, American soldier: b. near Petersburg, Dinwiddie County, Va., 13 June 1786; d. West Point, N. Y., 29 May 1866. After study at William and Mary College in 1805, he read law at Petersburg, and having obtained his license, rode the circuit and was retained in several causes. In 1808 he obtained a captain's commission in the United States army, and in 1809 embarked with his company from Norfolk to New Orleans. On 18 June 1812 war was declared by Congress against Great Britain (see WAR of 1812). On 6 July following Scott was commissioned the lieutenant-colonel of the Second Artillery. He at once was ordered to mobilize his regiment at Philadelphia and soon after, at his request, to proceed to the Canadian frontier. He arrived at the headquarters of Brig.-Gen. Alexander Smyth 4 October. The affair at Queenstown took place on 13 October. Scott did not take part in the successful attack on the heights, but commanded the American forces in the ensuing battle, and after brisk fighting was obliged to surrender to much superior numbers. He was soon after exchanged, in March 1813, was appointed adjutant-general with rank of colonel, and at about the same time was promoted colonel of his regiment. With the regiment he joined General Dearborn on the Niagara frontier, became Dearborn's chief of staff, led the successful attack on Fort George 27 May, commanded the rear guard in the retreat from Stony Creek to Fort George and co-operated with the naval forces in the descent on Burlington Heights and York. Promoted 9 March 1814 to be brigadier-general, he established a camp of instruction at Buffalo. Scott's brigade and Ripley's crossed the Niagara 3 July 1814; Fort Erie was invested and captured; and on the 4th Scott moved toward Chippewa. On 5 July occurred the battle of Chippewa (q.v.). Scott greatly distinguished himself, and General Brown, commanding, declared that to Scott more than any other the American victory was due. The battle of Lundy's Lane (q.v.) followed on the 25th, where Scott again displayed great ability. These battles, both won chiefly by Scott, fully established American military prestige. For his services, Scott received a gold medal from Congress, and was made brevet major-general (from 25 July). He declined to act as Secretary of War, and was in Europe in 1815-16. In 1826 he was made president of a board of army and militia officers convened at Washington for the consideration of various military questions, and in 1829 was assigned to the command of the Department of the East. In July 1832 he was ordered to Illinois to take command of the forces in the Black Hawk War (see BLACK HAWK), and left Buffalo for Chicago with 1,000 troops. He was not in the active campaign, but co-operated with Governor Reynolds of Illinois in concluding treaties with the Sacs, Foxes, Winnebagoes, Sioux and Menominees. At the time of the nullification troubles he was sent to South Carolina (1831-32), where he was successful

in averting civil war. He prosecuted the Seminole and Creek campaigns in Florida (1836), and superintended the removal of the Cherokees from Georgia to their reservation west of the Mississippi. On 25 June 1841 he became major-general and general-in-chief of the army. In 1839 at the Whig Convention at Harrisburg, Pa., Scott was presented as a candidate for the Presidency, though he urged Clay as first, Harrison as second, choice and the 62 votes cast for him went ultimately to Harrison. He was ordered on 23 Nov. 1846 to Mexico to take charge of the forces there. He assembled his troops at Lobos Island, moved transports in February, landed at Vera Cruz 9 March and effected its surrender 29 March. From this time he proceeded on the uniformly victorious campaign which practically closed the war by his entry into the City of Mexico on 14 September. (For complete account see *MEXICAN WAR* and articles on various battles). At the close of the war Scott relinquished the command to Gen. W. O. Butler, and returned to the United States, where he received a gold medal from Congress, and was a candidate in 1848 in the Whig Convention which nominated Taylor for the Presidency. In 1852 he was defeated by Franklin Pierce, and in 1855 made brevet lieutenant-general. In 1859, when the American and British governments were adjusting the northwestern boundary question, he was sent to Puget Sound to adjust the difficulties caused by the precipitate occupation of San Juan Island. At the outbreak of the Civil War, he took command at Washington 12 Dec. 1860, provided for the safety of the national capital, and the organization of the army, but resigned the command to McClellan 1 Nov. 1861. Scott was a strict disciplinarian and this, with his formality, led to his army nickname of "Old Fuss and Feathers." As to his skill as a military leader there can be no question. He gained notable distinction in two wars. Webster, in a Senate speech (20 Feb. 1848), called the Mexican War "the most brilliant campaign on recent military record," and Grant writes of the faultless strategy at Churubusco. His political defeats in no way detracted from his reputation. He published 'General Regulations for the Army' (1825) and 'Infantry Tactics' (1835). Consult biographies by Mansfield (1846); Headley (1852); Victor (1861) and Wright (1894); Scott's 'Memoirs' (1864); Townsend, 'Anecdotes of the Civil War' (1884); Wilcox, 'History of the Mexican War' (1892) and Barnes, J., 'Giant of Three Wars' (New York 1903).

SCOTT: Lockhart's *Life of*. The 'Life of Scott' by John Gibson Lockhart is the biography usually mentioned as a serious rival of Boswell's 'Life of Johnson.' The works have many points in common. Each has for subject one of the greatest men in English literature; each was written by a man intimately acquainted and thoroughly in sympathy with the subject; each is constructed upon a large plan, with canvas filled even to the smallest details. Furthermore, Lockhart followed the autobiographical plan of Boswell. Beyond these resemblances, however, there are striking dissimilarities. So far as command over language is concerned, Lockhart was probably superior to Boswell; but as a biographical artist he was

clearly inferior. He did not possess Boswell's dramatic skill, nor his ability to report a conversation, nor his discrimination in selecting the most important material.

The 'Life of Scott' is probably the longest biography of established rank in the English language. Carlyle, who reviewed it before the publication of the seventh and last volume, deplored what seemed to him the excessive length of the narrative. "Study to think it nothing miraculous," he wrote, "that seven biographical volumes are given where one had been better . . . Scott's biography, if uncomposed, lies printed and indestructible here, in the elementary state and can at any time be composed, if necessary, by whosoever has a call to that." Carlyle's opinion has in the main been justified. In 1911 Sir Sidney Lee expressed his conviction that "Lockhart's merit is mainly due to the excellence and the abundance of the raw material provided for him in Scott's ample journals and correspondence." In short, the 'Life of Scott' is a Gothic cathedral, overawing us by its size and magnificence, rather than a Greek temple, gaining our admiration by its artistry and simplicity.

With all of its limitations, however, the biography is great. The combination of subject and biographer is sufficient to guarantee its greatness, and, to a certain extent, its finality. Lockhart, personally acquainted with Scott since May 1818, became his son-in-law on 29 April 1820, when he married Sophia Scott. The biography was completed in 1838, six years after Scott's death. Lockhart had access to all documents; his work, therefore, together with the journals of Scott later published in full, must always remain the great mine of information from which later biographers must dig. In writing the life of his father-in-law Lockhart had set "the truth and the fear of God" before his eyes; his work, consequently, is not a panegyric; but, like Boswell's 'Life of Johnson,' a straightforward account of faults as well as of virtues. Professor Hugh Walker, in 'The Literature of the Victorian Era' (pp. 920-923), highly commends Lockhart upon the skill and insight with which he interprets certain manifestations of Scott's character, particularly his love of display and his consequent lavish expenditure. The style of the biography is admirable; several passages, notably the description of Scott's death, are among the best in English literature. All in all, the work, by its very length and exhaustiveness, forms a noble monument to the memory of a man who did all things on a large and magnificent scale.

WALDO H. DUNN.

SCOTTDALÉ, skōt'dāl, Pa., borough in Westmoreland County, on the Baltimore and Ohio and the Pennsylvania railroads, about 30 miles in direct line southeast of Pittsburgh and 16 miles south of Greensburg, the county-seat. It is in an agricultural and coal mining region, and it has considerable manufacturing interests. The chief manufacturing establishments are large pipe-works, rolling mill, foundry, machine shops and steel works. The coal mines of the vicinity contribute to the prosperity of the borough. The two banks have a combined capital of \$100,000. The principal buildings are the churches and schools. The educational in-

Winfield Scott

stitutions are a high school, public and parish elementary schools, a private school and a public library. Pop. 5,456.

SCOTTISH CHIEFS, *The*, a romance by Jane Porter, published in 1810. It was still popular, and historically correct in all important points. The narrative opens with the year 1296.

SCOTTISH CLANS, *Order of* (American), an organization with 4,000 members, having its headquarters in Boston, Mass. It is a fraternal and benevolent order, having in 1903 a total income of \$85,214. In the same year it paid out claims to the amount of \$67,000.

SCOTTISH GAELIC LITERATURE. The Gaelic spoken in the Highlands and islands of Scotland forms one of the subdivisions of the Gaelic language, the other two being Irish and Manx. (See **CELTIC LANGUAGES**; **GAELIC LITERATURE**). It was introduced into the southern part of Argyll by the Dalriads, who emigrated from Ireland in the 6th century, and there established the subkingdom of Dalriada. The language spread until it became paramount, and it was used at court as late as the reign of Malcolm Canmore. Gaelic, which was the language of the district of Buchan in Aberdeenshire, in the 12th century, and was spoken in Galloway in Queen Mary's reign, gradually retired north and west beyond the Highland line, until now its strongholds are Arran and the Hebrides, the counties of Argyll and Inverness, Ross and Sutherland, and parts of Perth and Caithness. A strong Gaelic-speaking colony was founded in Carolina in the 18th century. In 1772 the first Gaelic-speaking immigrants landed in Cape Breton Island, Nova Scotia, and in the first quarter of the 19th century some 25,000 landed in that part of Canada. Prince Edward Island, Glengarry in Ontario and other parts also received settlers who spoke the Gaelic tongue and have maintained it to the present time. One of the objects of Lord Selkirk in founding the Red River Settlement was the formation of a Gaelic-speaking colony, which, through difference in language, would be proof against any tendency to amalgamate with the Americans. Within the past half century there has been a marked revival of interest in the Gaelic literature of the Highlands, one of the proofs of which was the founding of a Gaelic chair in Edinburgh University in 1882.

For nearly 300 years Scotland and Ireland had a common literary tradition, and the tales of the great Irish legendary heroes were current in the Scottish Highlands. Adamnan's life of Saint Columba, written in the island of Iona before 713 A.D., is the first literary product of Gaelic Scotland that survives. The 'Book of Deer' is of the 9th century; the 'Book of the Dean of Lismore,' by Sir James MacGregor and his brother Duncan, is a manuscript collection of date 1512-26. John Knox's *Liturgy* was the first book to be printed in the Gaelic dialect (1567). Long after the invention of printing the output was small in this language; only some 20 books had been printed in Gaelic up to the time of the Rebellion of 1745. A valuable collection of manuscripts is deposited in the Advocates' Library, Edinburgh. The language has been peculiarly rich in poets, a succession of notable bards appearing for about 300 years. Among them may be cited Mary

Macleod (b. 1659); John Macdonald, a member of the Keppoch family; Alexander Macdonald, an officer in Prince Charles's army; Robert Mackay (Rob Donn, 1714-78); Ban McIntyre (1724-1812); Ewen McLachlan of Aberdeen (1755-1822), and William Livingston of Islay (1808-70). Consult Stuart's edition of the 'Book of Deer' (1862); 'Book of Lismore' (edited by MacLauchlan, 1862, and by Cameron, 1892); Blackie, 'Language and Literature of the Scottish Highlands'; Henderson, 'Norse Influence on Celtic Scotland' (1910); Sinclair, 'Gaelic Bards from 1411 to 1517' (1890); Carmichael, 'Carmina Gadelica: Hymns and Incantations, with Illustrative Notes orally collected in the Highlands and Islands of Scotland, and translated into English' (2 vols., 1900); McAlpine, 'Pronouncing Gaelic Dictionary, with a Grammar' (12th ed., 1903); McLeod, 'Dictionary of the Gaelic Language' (1909); Mac Bain, 'Etymological Dictionary of the Gaelic Language' (1911); Maclean, 'Typographia Scoto-Gadelica; or, Books printed in the Gaelic of Scotland from 1567-1914, with Bibliographical and Biographical Notes' (1915).

SCOTTISH PHILOSOPHY, *School of*, the school of philosophy founded by Thomas Reid, whose aim was to disprove the skeptical conclusions of Hume, which had obtained a wide vogue in Great Britain and on the Continent. Reid, who was born in Kincardineshire, Scotland, 26 April 1710, and died in 1796, insisted upon certain principles as everywhere present in experience, and he appealed to human consciousness and intelligence against what he called "the ideal theory." The resemblance of Reid's philosophy to Kant's vindication of the categories as elements necessary to the constitution of the simplest experience is obvious. Reid and his successors cannot be said to have produced a system, but they started many others in a train of thought that led to valuable philosophical observations, and the Scottish School of Philosophy proved no insignificant breakwater to the tide of skepticism which rose so high in the 18th century. Besides Reid, the most noted representatives of the Scottish philosophy were Dugald Stewart (1753-1828); Sir William Hamilton (1788-1856); W. Whewell, master of Trinity College, Cambridge (1794-1866); Henry Calderwood (1830-97). James McCosh (president of Princeton University from 1868 to 1888) and Noah Porter (president of Yale University from 1871 to 1886) belonged to the same school, and as teachers of philosophy contributed largely to its influence in this country. Consult McCosh, 'The Scottish Philosophy.'

SCOTUS, skō'tūs, **John Duns**, Franciscan friar, one of the great lights of the mediæval scholastic philosophy and theology. The years 1265 and 1275 are variously assigned for his birth; he died at Cologne, 8 Nov. 1308. His cognomen Scotus plainly betokens his Gaelic origin. The chief advocate on behalf of Ireland is Luke Wadding, who contends that Scotus cannot have been an Englishman, since his epitaph runs, "Scotia me genuit, Anglia suscepit"; not a Scotchman, since Bonaventure, in a list of the Franciscan provinces, mentions that of "Scotia, or Ireland"; on behalf of North Britain, Thomas Dempster (1579-1625), "one of the most learned men whom Scotland has pro-

duced," wrote a quarto volume designed to prove Duns Scotus a Scotchman; and on behalf of England the celebrated antiquary John Leland (1506-52), adduced considerable proofs of Scotus' English origin. Duns Scotus entered the order of Franciscan friars early in life, studied at Merton College, Oxford, and became a Fellow of the same. He went to Paris in 1304, to Cologne in 1308, where he died suddenly the same year and was buried in the Franciscan Church. His works consist of commentaries on the logical works of Aristotle and the 'Isagoge' of Porphy, a commentary on Aristotle's 'De Anima,' two commentaries on Aristotle's 'Metaphysics,' besides a shorter work 'Conclusiones ex XII Libris Metaphys. Aristotelis'; 'Grammatica Speculativa'; 'Tractatus de Rerum Principio'; 'De Primo Principio'; 'Theoremata'; 'Quæstiones Miscellaneæ'; 'Quæstiones Quodlibetales,' and the unfinished 'Tractatus de Cognitione Dei.' All these except the 'Quodlibetica' were written at Oxford. There, too, he wrote his 'Opus Oxoniense,' which contains his whole philosophical and theological teaching in collected form. Soon after his death decrees were passed requiring the Scotist doctrine to be taught in all the Franciscan schools. His works were collected by the Irish Franciscan Wadding in 12 folio volumes (Lyons 1639). The doctrine and teaching of Scotus, one of the two great schools of scholastic philosophy and theology, found its home in the Franciscan order to which its founder had belonged, just as the Thomist school found its home among the Dominicans of which Thomas of Aquin, its founder, was a member. Scotus was an earnest and most ingenious champion of the doctrine of the Immaculate Conception against the opposite teaching of the rival order of Dominicans. His place as theologian and philosopher was and is of the highest. See SCHOLASTICISM.

SCOTUS ERIGENA, ě-rīj'ě-na, **Johannes**, Christian philosopher of the Carolingian period. Everything concerning the place or date of his birth is conjectural. It has been divined from his name that he was of Scottish race and Irish birthplace. He was probably born between 810 and 815. He is said by some apocryphal authorities to have traveled in Greece, Asia, Egypt, Italy and France. But his first actual appearance in history is in the court of Charles the Bald, who was himself devoted to letters. He was induced by this monarch to translate the treatise 'On the Heavenly Hierarchy,' the work of the pseudo-Dionysius, the Areopagite. The attention of Hincmar, archbishop of Rheims, was attracted by the fame of Erigena who wrote at that prelate's request his work on 'Predestination.' 'The Heavenly Hierarchy' was a work which had a great deal of influence in development of mysticism (q.v.) in France. Pope Nicholas I in 867 complained to Charles the Bald that such works as this version of the Neo-Platonist's work were of doubtful tendency; it is not known what reply he received, but after that date Erigena drops out of the light of history. Johannes Scotus Erigena translated all the works of the supposed Areopagite; he also composed a treatise on the Eucharist in which he denied the real presence. His philosophical views were set forth in his 'Divisions of Na-

ture' which caused him to be charged with pantheism; and modern historians of philosophy have looked upon him as the precursor of Spinoza. It is certain that 400 years later (1225) Pope Honorius III, during the Albigensian crusades, condemned the book and ordered it to be burned publicly. Consult Hjört, 'Johann Scotus Erigena' (1823); Guizot, 'Histoire de la civilisation en France'; Milman, 'History of the Latin Church.'

SCOURGE OF GOD, The. See **ATTILA**.

SCOURING-RUSH. See **DUTCH RUSH**; **RUSH**.

SCOVEL, **Sylvester**, American journalist and engineer: b. Denny Station, Pa., 29 July 1869; d. Havana, Cuba, 11 Feb. 1905. He was educated at the University of Michigan, and in 1895 went to Cuba as war correspondent. He broke through the Spanish police and military lines 30 times, was twice captured, once making his escape, and on the second occasion, in 1897, was released at the request of the United States government. He was subsequently correspondent in the Turco-Greek War, in Spain, and in the Klondike, and returned to Havana just before the destruction of the *Maine* in 1898. He was with the army and navy until the surrender of Santiago, and after that was engaged in the promotion of various Cuban enterprises. In 1899-1902 he was consulting engineer for the United States military government Cuban customs service.

SCRANTON, **George Whitefield**, American manufacturer: b. Madison, Conn., 11 May 1811; d. Scranton, Pa., 24 March 1861. With his brother, Joseph H. Scranton, he engaged in the manufacture of iron at Oxford, N. J., in 1839, and in 1840 they established smelters at Slocum, now named in their honor, Scranton, Pa., using anthracite coal in their furnaces. Later Scranton became interested in railroad transportation, and he was president of the Lackawanna and Western and of the Cayuga and Susquehanna railroads. He served in Congress in 1859-61.

SCRANTON, Miss., town and county-seat of Jackson County, on the Pascagoula River, near the Gulf of Mexico, and on the Louisville and Nashville Railroad, about 48 miles southwest of Mobile, Ala. It is in a lumbering region, and the town is known also for its extensive fisheries, especially the oyster industry. The chief industries are connected with the manufacturing and shipping of pine lumber, and, in the season with the canning and shipping of oysters. Pop. about 2,500.

SCRANTON, Pa., city and county-seat of Lackawanna County, is the third in population in the State. It is 167 miles from Philadelphia, northerly, and 134 from New York, westerly; and a central point on the Delaware, Lackawanna and Western Railroad. It is also entered by the Central Railroad of New Jersey, branches of the Delaware and Hudson, the Erie and the New York, Ontario and Western railroads. The Lackawanna and Wyoming Valley Railroad (Laurel Line), of new and costly construction and operated by electricity, is another connecting link south and eastward. Built on both sides of the Lackawanna River, which merges into the Susquehanna River some eight miles to the southward, the city is pleasantly

2 Delaware, Lackawanna and Western Railroad Viaduct, Nicholson, near Scranton, Largest concrete bridge in the world

situated on an undulating plateau in the Lackawanna Valley, at a mean altitude of between 700 and 800 feet above sea-level. Mountain ranges on either side attain an elevation of from 1,000 to 1,200 feet more. Laid out with wide streets and avenues, it has also many driveways, a courthouse square and three parks. Among the prominent public buildings in Scranton are the post office, courthouse, municipal building, public library (Albright Memorial), 13th Regiment Armory and the Moses Taylor Hospital. There are three other general and two private hospitals, a Y. M. C. A. building, the buildings of the International Correspondence School, theatres, numerous public and private schools and churches of all denominations, many of the church and school buildings being large and costly.

Industries.—Scranton is the centre of the chief anthracite coal district of the United States and has many large collieries within its limits. Prior to its development in coal mining, a blast furnace was first erected here in 1840 and was soon followed by a rolling and rail mills. Subsequently other important establishments working in iron, but less extensively, became well-known producers of mining machinery and other tools, and of steam boilers, locomotives, car wheels, wagon axles, stoves, grates, nuts and bolts, railway spikes and the like. For reasons of an economic nature the rolling and rail mills have in later years been taken elsewhere, but the other industries continue; and still more diversified ones have been introduced, manufacturing articles of various materials, including silk and silk goods, under and outer wear, buttons, lace curtains, pianos, pumps, iron founding, locomotive and stationary engine works, etc. Steam heating by the district plan is supplied on a large scale to the business and many residential sections by a private company. In addition to much Scranton capital invested in all parts of the country, other local interests are cared for by 20 banking institutions with a capital and surplus of \$11,891,107, total deposits of \$41,643,983, and annual clearings of about \$175,000,000, and sundry building and loan associations. Local newspapers, daily and weekly, and numerous monthly and other publications are regularly issued. The International Correspondence Schools are located here. This is the largest educational establishment in the world. It gives employment to more than 4,200 people, and has enrolled 1,400,000 students, representing every nationality in the world.

History.—This locality was originally settled 1788–1800. Early in the century it was called Slocum Hollow, after the Slocum family, then prominent in its affairs. More active development took place after 1840, largely through the initiative of Col. George W. and Seldon T. Scranton, and associates. It was named in honor of the former and has since been known as Scranton. It was incorporated as a borough in 1854 and as a city in 1866.

Government and Social Life.—The city is governed by a mayor elected for four years, city controller and council of five members. The administrative departments are those of public safety, public works, city treasurer, city attorney, assessor, city clerk and the sinking fund commission. Social life of Scranton is evidenced in numerous associations, clubs and

lodges of all kinds; while many and effective public and semi-public charities are also well supported by the citizens.

Statistics.—The municipal area is practically 20 square miles, divided into 24 wards. There are 185 miles of streets, avenues and courts, of which 68 miles are paved; and the sewer system measures 110 miles. Public lighting is by electricity; the police department costs annually not less than \$120,000, and the fire department \$125,000. The school enrolment exceeds 20,000 pupils, and annual expenditures for public education are more than \$900,000. Assessed property valuation in 1918 was about \$100,000,000. Average annual death rate is less than 16 per thousand, but only 13 for the year 1916. Scranton is one of the few large cities in the United States having an almost unlimited water supply, though not controlled by the city. The water is soft and pure, impounded from mountain streams and a large, well-protected watershed. It is delivered by gravity from several reservoirs and a large artificial lake. The daily water consumption is about 25,000,000 gallons, while an average of about 5,000,000,000 gallons is kept in store the major part of the year. Pop. 144,081.

SCRATCHING. See **BALLOT**.

SCREAMERS, the name given to two or three genera of birds, forming the family *Palmædæ*. In the genus *Palamedea* the nostrils are oval, the head possesses a slender frontal horn more than three inches long; the wings each bear two sharp shoulder spines with bony cores, and the long toes are covered with square scales above. To this genus belongs the horned screamer (*P. cornuta*), of the Amazon Valley and Guiana, which inhabits hot morasses and swamps. This bird equals a turkey in size. The voice is shrill and loud and the birds scream in concert. The plumage is a blackish-brown above, the head and neck having the feathers marked with white. The genus *Chauna*, of which the chaja or crested screamer (*C. cristata*) is the representative, has the tip of the bill hooked. No horn exists on the head. The name "chaja" is given to this species from the sound of its cry. It occurs in Brazil and Paraguay. It is of solitary habits. The wings possess, as in the former case, two spurs each. The color is a bluish-gray marked with black, the neck being encircled by a black collar, while a tuft of feathers on the head constitutes a crest. Round the eyes the skin is naked and of a red color. The food consists chiefly of plants and the flight is strong. The eggs are two in number. A third form (*Ischyromis derbiana*), closely related to the last, inhabits Central America. A remarkable feature of all of these birds is the great development of subcutaneous air-sacs, like a thick layer of bubbles beneath the skin, which make a crackling sound when pressed. Although galline in appearance and general habits, these birds are more closely related to the ducks and geese. Consult Evans, A. H., 'Birds' (in 'Cambridge Natural History,' Vol. IX, New York 1900), and Sclater and Hudson, 'Argentine Ornithology' (London 1888).

SCREEN, in ecclesiastical architecture, a partition of stone, wood or metal to separate different parts of the building; as, the nave or an aisle from the choir, or a private chapel from

the transept. The term is also applied to a partition extending across the lower end of a mediæval hall, forming a lobby within the main entrance doors, and having often a gallery above; also to a decorated wall enclosing a courtyard in front of a building.

SCREW, a wooden or metal cylinder having a spiral ridge (the thread) winding round it in a uniform manner, so that the successive turns are all exactly the same distance from each other, and a corresponding spiral groove is produced; also a reversed mechanism, in which the interior of a cylinder in a cylindrical hole or nut is provided with a corresponding uniform spiraled groove or thread, into which a screw (as first defined) may fit. For differentiation the primary screw is termed a male screw, and the secondary form a female screw. The male and female screw in combination form one of the six mechanical powers, being simply a modification of the inclined plane. The energy is transmitted by means of a hollow cylinder (the female screw) of approximately equal diameter with the solid one (the male screw). Hence the one will work within the other, and by turning the convex cylinder, while the other remains fixed, the former will pass through the latter, and will advance every revolution through a space equal to the distance between two contiguous turns of the thread. As the screw is a modification of the inclined plane it is not difficult to estimate the mechanical advantage obtained by it. If we suppose the power to be applied to the circumference of the screw, and to act in a direction at right angles to the radius of the cylinder, and parallel to the base of the inclined plane by which the screw is supposed to be formed, then the power will be to the resistance as the distance between

Hunter's Screw-press.

two contiguous threads to the circumference of the cylinder. But as in practice the screw is combined with the lever, and the power applied to the extremity of the lever, the law becomes: The power is to the resistance as the distance between two contiguous threads to the circumference described by the power. Hence the mechanical effect of the screw is increased by lessening the distance between the threads or making them finer, or by lengthening the lever to which the power is applied. The law, however, is greatly modified by the tremendous friction induced. The uses of the screw are various. It is an invaluable contrivance for fine adjustments such as are required in fine telescopes, microscopes, micrometers, etc. It is used for the application of great pressure as in the screw-jack and screw-press; as a borer in the gimlet; and in the ordinary screw-nail we have it employed for fastening separate pieces of material together. The *differential screw*, or *Hunter's screw*, is formed of two screws, a larger and a smaller, the former being screwed internally to allow the latter to screw into it; the pitch of the two screws differs slightly, and for each turn of the chief or

larger screw the progress of the point of the compound screw is the difference of pitch. Great power is in this way attained without the weakness due to a screw with fine threads. Screws for working in wood are commonly tapered, coming to a point; while machine-screws for use in metal are cylindrical and commonly flat or dull-pointed on the forward end. Exceptions are the set-screw, which has a sharp circular ridge on the forward end, to give it a bite or set when screwed down hard; and screws that are pointed or squared for some special purpose. Machine-screws were originally made by hand, a blank being forged on the anvil, and the thread being cut on a lathe or even with a file. Under this primitive system no two screws were alike, and when a screw had to be replaced it was difficult to make another that would fit. Henry Maudsley, of England, about the opening of the 19th century, gave great study to the production of uniform and accurate screws, laying the foundation for modern interchangeable machine-screws. He was followed by Sir Joseph Whitworth, who established the primary system of uniform threads subsequently accepted by leading machine-builders all over the world. Later, the Sellers standard was adopted in America and largely followed. The chief difficulty was the attaining of accurate and uniform pitch or spacing of the screw-threads, because any error was multiplied. For instance, an error of one ten-thousandth of an inch in a space between screw-threads, which would ordinarily pass unnoticed if there were only half a dozen turns, would increase with the length of the screw and number of threads, so that with 24 threads to the inch, a screw a foot long would multiply that error by 288, so that the screw would bind and jam before it would go far into its counterpart. It was found, in cutting a thread, that the very heating of the bar of metal and of the cutting tools, by their own friction, caused a variation in the threads, because of the expansion of metal under heat. But by ingenious means such errors have been compensated, and screws are now turned out very cheaply with great accuracy.

To cut a screw-thread by hand, the blank or bit of stamped metal, or a metal rod of the desired diameter, is mounted between the centres of a lathe, while a cutting tool is fixed on the slide-rest, and forced against the rotating blank, the slide-rest having a positive lateral rate of movement, so that a spiral is cut in the blank, the form of such spiral being determined by the ratio of the speed of rotation of the blank to the lateral movement of the cutting tool. This process is repeated until the thread is sufficiently deep, and it matches a master screw, which is placed beside it to test its accuracy. Another method is to use a screw-die and die-stock, which carries a pair of hardened steel cutting dies of the desired standard. These dies are placed straddle of the rod or blank, and being fixed in the die-stock, either the work or the stock is rotated until the thread is cut, the dies being pressed together gradually by a screw in the stock. Similarly a female thread may be formed with a screw-tap worked into a hole with a wrench. But in modern screw-making only the above principles are followed, screws being made on lathes specially

designed to work automatically and cut a large number of accurate screws at one operation. These machines are so thoroughly automatic, that an attendant can watch several of them, so that vast numbers of small screws can be turned out at surprisingly small cost, when their almost perfect accuracy is considered. By employing what are termed "change-wheels" on the heads of the lathes, the number of screw-threads may be altered from one standard size to another. A common principle used in screw-cutting is to employ a master-screw, or hardened screw known to be of accurate standard, as a guide for the cutting of duplicates. This master-screw carries a nut, which travels and directs the movement of the blank or bar that is being threaded. The heads of screws may be formed—(a) by upsetting or thickening the blank before cutting; or (b) by using a bar of the diameter of the head, and milling away the superfluous metal. In modern practice a milling cutter is often employed in making screws on a special machine which is half lathe and half miller. The milling cutter is mounted on a swiveling device for forming various angles in the thread. This method is well suited to forming screws that are of alloyed metal, where the cutting speed must be made suitable to the alloy. It is not adapted to very small screws, but is admirable for cutting worms or other very broad threads.

The familiar types of screw are named from the thing to which they are attached, as bench-screw, a coarse screw on a carpenter's bench for clamping the work; from the form or shape of the head, as square, hexagonal, round, conical, countersunk screw, etc.; from the character of the thread, as standard V, double (having two parallel threads running together), triple, etc. A winged or thumbscrew has a flat head that may be turned with the thumb and fingers; the Archimedian screw is a spiraled trough or tube which when laid at an angle of about 35 degrees, with the lower end in water, can be made to raise the water by turning; the differential screw has two different threads on one solid body, so that its ultimate motion is the difference between the pitch of the two threads; flat-screw, a spiral on the face of a disc, as a Victor record; interrupted screw, one having grooves cut longitudinally with threads like a tap; screw-coupling, a pipe coupling or metal collar with interior or female threads for joining pipes or round rods; screw-dog, a lathe-dog having a screw for gripping the work; screw-eye, a screw having a loop or eye for a head—when made with a hook it is a screw-hook; screw-plate, the holder of a die-stock; screw-press, a press in which the power is applied by a screw, as the primitive form of printing press; screw-rod, a rod having a screw-thread cut on one or both ends; screw-wrench, any wrench whose jaw is moved by a screw; tractor-screw, the screw-propeller of an aeroplane when placed in front as a tractor.

In 1914 there were 66 establishments in the United States devoted to manufacturing machine-screws and 12 to wood-screws. The number of employees was larger with the wood-screw makers, being 4,464 and 3,643, respectively; but the gross money value was \$7,248,000 for the machine-screws and \$6,217,000 for the wood-screws. Probably this is less

than half the production of the entire country, as very many machine manufacturers make their own screws.

CHARLES H. COCHRANE,

Author of 'Modern Industrial Progress.'

SCREW-PINE, a popular name for species of *Pandanus*, order *Pandanaceæ*. The species, of which more than 50 have been described, are natives of the tropics, and are especially numerous in the Australasian Archipelago. They are mostly trees or shrubs with slender or stout trunks, frequently with aerial roots. Each naked branch is terminated by a tuft of long sword-shaped spiny-edged leaves. In tropical countries *P. utilis* is highly valued for its edible fruits, and the fibres of its roots and leaves. The leaves of *P. odoratissimus* also yield a valuable fibre (q.v.). The former species, which has green leaves, and *P. veitchii*, which has variegated foliage, are widely popular in greenhouses, being easy to rear, fairly rapid in growth, and striking in appearance. The name screw-pine is suggested by the perfect spiral arrangement of the leaves easily observed in mature specimens, and also from their resemblance to the pineapple.

SCREW PROPELLER, a mechanical device embodying the principle of the screw, employed in the propulsion of various kinds of marine craft—ocean steamships, warships, tug-boats, yachts, motor-boats, etc.—and all forms of aircraft. Only the marine form will be treated here: for the air propeller see **AEROPLANE—CONSTRUCTIONAL FEATURES**.

The marine propeller consists of a cylindrical or spherical hub or boss to which two or more blades are attached with bolts, and forms the screw which acts in the water somewhat like a screw bolt in a nut and the rapid rotation of which around its axis pushes the vessel forward.

It is the accepted modern method of ship propulsion and although known to waste at least 40 per cent of the power delivered to it by the driving engines, it has almost completely superseded the paddlewheel and confined the application of the latter to river steamers and other light draft craft.

Although known in principle to the ancients, and suggested in France by Bernouille in 1752, by Edward Shorter in 1800, and by Dallery in 1803, the credit for its modern reinvention and practical application appears to belong to Ressel, the Austrian inventor, who took out a patent for it in 1812 and used it practically on the steamer *Civetta*, in 1829. The idea was further developed by Sauvage in 1832, and a few years later, in England, by Smith and Ericsson. Smith's modification—the reduction in the number of blades, was suggested by an accident which broke off one of the six blades in his propeller, resulting in a decidedly accelerated motion of the vessel.

In America, Evans and Fitch experimented with screw propellers in 1780 and 1790, and Stevens successfully operated a steamboat equipped with a screw propeller, in 1802, but it was most practically developed and applied by Ericsson in 1839, in connection with the United States steamer *Princeton* which was the first screw-propelled war vessel ever built in any country. She was built through the recommendation of Commodore Stockton, under

Ericsson's personal superintendence. She had a tonnage of about a thousand tons, and was the first war vessel in which the machinery was entirely below the water-line, and her unequalled success not only demonstrated the particular value of the screw for vessels of war, but quickly led to its general application to those of the merchant service as well, before the close of the year 1870.

Each blade of a screw propeller may be considered as the small portion of a complete screw-thread of great pitch, and considerable depth relative to the pitch. The pitch of a propeller is the distance through which a point on the tip of one of the blades would move—in one revolution, assuming the water in which it turns to be a solid medium. As the water is not solid, but gives way as soon as its low degree of inertia is overcome, the shape given to the blade is not that of the true helical screw, but is so modified as to give it the firmest possible grip on the yielding water. There are two general types—(1) those in which the blades are plain warped surfaces, and the pitch is constant at all points, that is, the generating line of every blade keeps the same angle with the boss, and (2) those in which the blades are curved and bent in various ways, and the pitch is variable at different parts of the blades. Many different screws of this type, with variable or increasing pitch, have been designed in the attempt to produce a form that would reduce to a minimum the loss of applied power due to the rotary motion of the screw which forces the water away radially and the loss due to the friction of the blades. In the earlier forms, in which the boss was of small diameter—about twice that of the shaft—the increasing angle of the blade surfaces, as they approached the axis, placed them at the boss in a position parallel to the keel, so that the central portion of the screw gave very little propulsive efficiency—a great deal of the power being used up merely in churning and agitating the water. Another cause that wasted a great deal of energy was the number and length of the blades, and their great width at the ends, all of which absorbed power by surface friction.

To obviate these faults, Griffiths substituted for the central portion a large spherical boss, one-third the diameter of the whole propeller, which revolved smoothly in the water. He also diminished the width of the blades, and attached them to the boss in such a manner that they could be turned upon their axes and thus given various inclinations according to the speed intended for the ship. In the latest types of propellers, the diameter of the boss varies from one-fifth to one-third of that of the whole screw; while the diameter of the whole screw depends upon the speed required, the character of the driving machinery, the form of the ship, and many other conditions for which only approximate rules can be given. It is interesting and valuable to note in this connection, that upon the basis of the data derived from the actual tests of a great variety of screw propellers it is safe to state that the exact effect due to the form of their blades has not as yet been definitely determined, and that the shape of the hull of the vessel is by far the chief controlling factor in determining the question of speed.

Another factor which adds greatly to the loss of applied power is the "slip" resulting from the working of the screw in a yielding or fluid medium and, therefore, requiring a greater number of revolutions to travel a given distance than would be required if it worked in a solid medium. Slip is a factor which adds greatly to the waste of applied power in all forms of propellers—sails, oars, paddlewheels, etc. In the case of the screw propeller, the difference between the distance traveled by the screw in a fluid, and the interval of its advance in a solid medium is known as the "apparent slip"; while the backward velocity given to the water immediately acted upon by the screw, is called the "real slip." Both of these results are consequences necessitated by the working of a screw in a fluid medium, and may under certain circumstances vary considerably from each other. "Negative slip" is a term used to denote the actual speed of a ship above its calculated speed, very often attained by a change of the size or form of the propeller. Real slip may be expressed by the formula $\frac{v + f - s}{v}$, in

which (v) represents the speed of the screw, (s) the speed of the vessel, and (f) the velocity of the forward motion of the water following in the wake of the vessel. The factor (f), being due to the frictional resistance of the vessel, depends so much upon the shape of its hull, that it is not susceptible of accurate determination, so that in considering the loss of applied power in this connection, the result ordinarily referred to is the apparent slip.

The speed of propeller is expressed by multiplying the number of its revolutions per minute by its pitch. This expression gives the theoretical speed per minute. The slip being subtracted from this gives the actual or effective speed. If the vessel were moored to a dock while the screw was running, the entire speed would be nullified by the slip.

The efficiency of different forms of propellers differs but slightly so long as their pitch, and their blade areas are designed correctly to suit the conditions for which they are employed. In general three-bladed propellers are the most efficient and are free from vibrations than the other forms. As previously stated, however, the most important element affecting the propulsive efficiency of a screw propeller is the form of the vessel. For low speeds, bluff bows and full sterns gives results equally as good as sharp bows and lean sterns with a long hollow run; while on the other hand the last-named qualifications give a form that allows the waves of replacement to flow in solidly to the propeller, and is the most appropriate for high speeds. In general it may be said that the problem of the most efficient propeller for any given ship depends upon the speed at which the ship is intended to be driven. This being decided, the hull must be modeled in such lines that the water pushed to either side by the passage of the vessel shall have ample time and room to come solidly together again before the propeller begins to work in it. Hence, the slower the speed the fuller the stern may be modeled; and the higher the speed, the finer the lines of the stern approaching the propeller. Upon the

modeling of the hull, therefore, depends the speed of the engines. If the propeller is turned too fast for the possible speed of the model through the water it will simply churn the water (in part) to foam, at a great loss of efficiency. So that the number of revolutions of the screw per minute is actually determined by the shape of the hull, and its consequent resistance to motion through water. A slow moving screw may have narrower and longer blades, thus reducing the friction of the blade surfaces on the water, and in this way making for efficiency of the power delivered by the engine. And a slow moving screw may also have a greater pitch than a fast running screw, and this also tends to increase efficiency. The most satisfactory slow propellers (those on merchant ships) have a pitch of 12 to 1.5 times the diameter of the screw. On the contrary, the fast screws on passenger ships and war vessels, particularly those run by turbine engines, have a pitch of less than their diameter, and broad squat blades. Broadening the tip of the propeller blade increases the thrust, but slows down its speed. Conversely, the slow engine admits of a propeller of larger diameter, and with wider tips; and the efficiency of engines is greater at moderate speeds. So that the problem of the propeller depends upon the skilful balancing of many requirements and each must be given its weight in the compromise to achieve the best possible result.

Figs. 1 to 8 show a few of the 150 forms of screw propellers, designed at different periods, and illustrate in a general way its development from the primitive form designed by Ressel in 1812. All of those used at the present time,

FIG. 1.—Ressel-1812.

FIG. 2.—Ressel-improved.

however, are modifications of the Griffiths, Thornycroft, and Jarrow types. The Hirsch propeller has not come into general use for shipping, although in all trials it has shown an

FIG. 3.—Ericsson-1835.

FIG. 4.—Maudslay-1848.

efficiency from 3 to 8 per cent higher than the other types. It has, however, been largely adopted for motor-boats and small yachts and speed boats, and there are numerous modifica-

tions of it under various trade names. The so-called "weedless" propellers are on Hirsch lines.

Propellers are built of iron, steel or bronze. The last named is the preferred material and while there are as many formulas as there are

FIG. 5.—Hirsch-1860.

FIG. 6.—Griffiths-1865.

manufacturers, they may be classified generally under four groups: (1) Admiralty bronze, with a composition of about 87 per cent copper; 8 per cent tin; 5 per cent zinc; and with a strength of 15 tons to the square inch; (2)

FIG. 7.—Jarrow-1880.

FIG. 8.—Thornycroft-1885.

phosphor bronze, 82.2 per cent copper; 12.95 per cent tin; 4.28 per cent lead; 0.52 per cent phosphorus; and with a strength of 17 tons per square inch; (3) aluminum bronze, 95 per cent copper and 5 per cent aluminum; with a strength of 25 tons per square inch; and (4) manganese bronze, of secret composition, except that it contains both copper and zinc, and has a strength of 30 tons per square inch. The cast iron or cast steel propellers of the slow-going merchant ships have a strength of from 10 to 20 tons per square inch. This would not be safe for a fast running propeller. The blades are cast solid with the boss, or made separate and bolted or attached to it in various ways. For small boats a reversible propeller is made in such fashion that the pitch of the blades may be altered from right-hand to left-hand by moving a lever working through a hollow propeller shaft, thus reversing the direction of the thrust without reversing the engine. A screw propeller when in position is secured to the end of the shaft of bronze or steel called the propeller or tail shaft, which is connected to the line shafting attached to the crank shaft of the driving engine. The push

or thrust of the screw, which is equivalent to the resistance of the hull, and amounts to about 20,000 pounds per 1,000 horse power, is received on a thrust bearing provided with a series of collars and grooves which fit similar ones on the shaft. Small vessels, and those designed for slow speed, are usually equipped with single screws; but for large high speed vessels, twin screws placed horizontally at right angles to the keel, one on each side of the stern post, are the most efficient. Some vessels have been fitted with three screws, but the amount of additional efficiency derived from the arrangement is a very doubtful quantity. On the other hand, high-powered vessels equipped with turbine engines employ multiple screws, the engines operating two, three or more shafts, with the advantage of dividing the work of generating the enormous power required by large modern ships among several small engines instead of one large ponderous machine, thus reducing to a minimum the difficulties and dangers incident to breakdowns. Sailing vessels using steam only as an auxiliary power are equipped with "feathering" screws, the blades of which can be closed together in a line parallel with the keel, and thus prevent them from acting as a drag when the vessel is propelled by the sails alone.

Fig. 9 shows the stern of the United States cruiser *New York* with twin screws in position.

FIG. 9.—Twin Propellers, U. S. S. *New York*.

Screw Propeller and Other Competing Instruments of Marine Propulsion' (London 1909).

SCREW-WORM FLY, one of the flesh-flies (q.v.) most troublesome to domestic animals in the southwestern United States. It lays its eggs in wounds, and the twisted larvæ feed and move in the flesh, making a bad sore.

SCRIABIN, skrī'ā-bēn, **Alexander**, Russian composer: b. Moscow, 10 Jan. 1872; d. there, 1915. In early life he was trained for a military career, but entered the Moscow Conservatory where he studied piano under Safonov and composition with Taneiev. In 1892 he won the gold medal for piano playing and during European tours achieved fame as a virtuoso. During 1898-1903 he was professor in the Moscow Conservatory, then resigned and devoted his energies to composition. Chopinesque yet original, his early piano pieces are marked by fervid spirituality, which led him after 1900 to formulate a synchronous theory of music, color and perfume which he sought to prove by means of his "color keyboard" and his symphonic work 'Prometheus or Poem of Fire.' His other works include a piano concerto and four symphonies.

SCRIBE, skrēb, **Augustin Eugène**, French dramatist: b. Paris, 24 Dec. 1791; d. there, 20 Feb. 1861. He was originally intended for the legal profession, but early abandoned it for the more congenial occupation of a writer for the stage, in which after a careful study of the public taste his success was very decided. His first piece was 'Les dervis,' written in conjunction with his friend Germain Delavigne, and produced in 1811. Scribe's dramatic pieces comprise all the departments of the lighter kind of drama, and from their gaiety and interest of plot, as well as the felicitous manner in which modern French life is depicted, have acquired a universal popularity in Europe, and have also been introduced on the English stage in translations. Among his vaudevilles may be mentioned 'Le comte Ory,' 'Le nouveau pourcentage' and 'Une visite à Bedlam.' He wrote for the Odéon, the Porte Saint Martin, and the Variétés theatres, but more especially for the Gymnase Dramatique, to which he furnished 'La maitresse du logis'; 'Malvina ou un mariage d'inclination'; 'Le mariage de raison'; 'Genéviève, ou la jalousie paternelle'; 'Maitre Jean, ou la comédie à la cour'; 'L'Amitié, ou les trois époques'; 'Héloïse et Abélard'; and numerous other pieces. To the Théâtre Français he contributed 'Bertrand et Raton' (1833); 'Le verre d'eau' (1840); 'Adrienne Lecouvreur' (1849) and 'Les contes de la reine de Navarre' (1850). In collaboration with Legouvê he wrote 'Bataille des dames' (1851) and 'Les doigts de fée' (1858). As a writer of opera librettos Scribe is also deservedly famous, having supplied composers with the text of the most celebrated of those produced at the Grand Opera and Opera Comique. Of these mention may be made of 'La dame blanche' (1825); 'Fra Diavolo' (1830); 'Robert le Diable' (1831); 'La juive' (1835); 'Les huguenots' (1836); 'Les diamants de la couronne'; 'Les martyrs' and 'Le prophète' (1849). From the multiplicity of works with which he was engaged, Scribe, like other French authors, availed himself largely of the assistance of collaborateurs, and much,

therefore, which bears his name was in reality only subjected to his revision and superintendence. In 1836 he was admitted a member of the French Academy.

SCRIBE, The, an early Egyptian statue now in the Louvre Museum, Paris. Colored red, and with inlaid eyes of crystal, it is regarded as one of the most characteristic illustrations of the art of the fifth dynasty.

SCRIBES, Jewish. Originally nothing more than copyists of the law, a business which they followed as a means of livelihood, the Jewish scribes gradually increased the importance of their position until, after the dissolution of the commonwealth, they became the vital force which determined the later form of Judaism. The importance of their office as doctors of the law and interpreters of the Scriptures is shown in many passages in the Old and New Testament. During this rise in the influence of the Jewish doctors they were known by five distinct appellations: (1) the Sopherim, or "Scribes," who guarded the Bible against corruption and who read the law; (2) the Tanaim, or teachers of the law; (3) the Amoraim, or doctors of the law; (4) the Saboraim, or teachers of the law after the conclusion of the Talmud; (5) the Gaonim, or last doctors of the law in the chain of rabbinic succession, the latter title being applied to the presidents of the colleges, which when assembled together explained difficult points in the Talmud, discussed and answered all ritual questions and enacted new laws for the regulation of the dispersed congregations.

SCRIBLERUS CLUB, The, a club organized by Swift in 1714. An association of writers, its object was the suppression of exhibitions of literary incompetence by means of satire. Pope, Gay, Bolingbroke and other authors of that day were prominent as members.

SCRIBNER, skrīb'nēr, Charles, American publisher: b. New York, 21 Feb. 1821; d. Lucerne, Switzerland, 26 Aug. 1871. He was graduated from Princeton in 1840, and in 1846 established with Isaac D. Baker the publishing house of Baker and Scribner, which after the death of his partner in 1850 became known as that of Charles Scribner and Company. *Scribner's Magazine*, founded by this firm in 1870, was purchased by other publishers and became the *Century Magazine* in 1881. A new *Scribner's Magazine* was established by the firm, known since the death of its founder as Charles Scribner's Sons, in 1887.

SCRIBNER, Frank Kimball, American author: b. New York, 22 Feb. 1866. He was graduated from Williams College in 1890, studied at Harvard Law School, engaged in literary work since 1903 and was for four years on staff of the *New York Sun*. He has contributed articles to current publications and has had published series of hunting and fishing stories, 'The Honor of a Princess' (1897); 'The Love of the Princess Alice' (1898); 'The Fifth of November' (1898); 'A Continental Cavalier' (1900); 'The Red Lion'; 'The Ravens of the Rhine'; 'The Secret of Frontel-lac.' He is a member of the Author's League of America, the Williams Club, the National Geographic Society, American Forestry Association and the Social Science Club.

SCRIBNER, Frank Lamson. See LAMSON-SCRIBNER.

SCRIP, in commerce, a term commonly used for a certificate of loans or shares in a joint-stock company, whether as a temporary acknowledgment or the permanent voucher of the holder's interest. Script may accordingly be either transferable or not transferable. The valid transfer of interest may be effected only by registration in the books of the company, or the transfer of the scrip itself may be held to represent a valid transfer of interest. In heraldry, a bearing representing a pouch or almoner. The word also means a scrap of paper or parchment usually with some writing on it, and during and after the Civil War in America was applied to the fractional paper money issued by the government of the United States.

SCRIPTURE, skrip'tūr, Edward Wheeler, American psychologist: b. Mason, N. H., 21 May 1864. He was graduated from the College of the City of New York in 1884. After pursuing his psychological investigations at the universities of Berlin, Leipzig and Zürich, he was called to Yale, where he became director of the psychological laboratory in 1898. In 1902 he became assistant professor of psychology there and four years later was made lecturer at Johns Hopkins. In 1909 he became lecturer on psychiatry at Columbia. He has attained distinction as the discoverer of a method of measuring hallucinations and processes of imagination, and as the originator of a method of producing insensibility by means of electricity. He is also known as the discoverer of the law of the "mediate association of ideas." His contributions to the literature of experimental psychology include 'Thinking, Feeling and Doing' (1897; 2d ed., 1907); 'The New Psychology' (1898; 2d ed., 1905); 'The Elements of Experimental Phonetics' (1902); 'Report on the Construction of a Vowel Organ' (1905); 'Researches in Experimental Phonetics' (1906); 'Stuttering and Lipping' (1912). In 1892-1902 Dr. Scripture edited the *Studies from the Yale Psychological Laboratory*.

SCRIVENER, skriv'nēr, Frederick Henry Ambrose, English Biblical scholar: b. Bermondsey, London, 29 Sept. 1813; d. Hendon, 26 Oct. 1891. He was educated at Trinity College, Cambridge, and from 1846 to 1856 was headmaster of Falmouth School and incumbent of Penwerris, retaining this living till in 1862 he was presented to the rectory of Gerrans, Cornwall. In 1870 he was appointed a member of the New Testament Revision Company, and in 1872 was granted a pension from the civil list in recognition of his services in connection with Biblical criticism. In 1875 he became vicar of Hendon, Middlesex, and prebendary of Exeter. He took high rank in the philological criticism of the New Testament, on which he published some valuable works, beginning with an edition of the Greek text in 1858, executed after collating about a score of unexamined manuscripts. His chief work was his 'Plain Introduction to the Criticism of the New Testament' (1861). He also published 'Cambridge Paragraph Bible' (1873) and 'Bezae Codex Cantabrigiensis,' etc.

SCROFULA, a diseased state of the body characterized by usually indolent cheesy glan-

dular tumors which suppurate and imperfectly heal, leaving fistulous passages or ugly scars. It is also known as struma, scrofulosis, tuberculous adenitis and tuberculosis of the lymphatic system. It is a mild grade of tuberculous infection and should be treated as such. Sometimes internal organs, especially bones and joints, are attacked by a low grade of inflammation followed by a caseous degeneration. Scrofula was common in ancient and mediæval times. It was formerly called king's evil, and for centuries was treated by the touch of the kings of England and France. It is now less common than formerly, owing to better hygienic conditions. It is essentially a disease of early life, but may occur at any age. Formerly it was considered a hereditary form of tuberculosis; but before Koch discovered the bacillus of tuberculosis in 1882 scrofula was looked upon by many as a true tuberculosis, since miliary tubercles were found in the glands, as afterward were the typical bacilli. Modern medicine does not recognize any disease as scrofula. It is usually tuberculosis (q.v.).

SCROGGS, skrögz, **SIR William**, English jurist: b. Deddington, Oxfordshire, about 1623; d. London, England, 25 Oct. 1683. His name is a synonym for judicial injustice and cruelty. He was appointed chief justice in 1678 in which office his brutal methods and infamous partiality in conducting the trial of the victims of the "popish plot" soon made him notorious. He was impeached by the House of Commons in 1680 but was never tried but in 1681 was removed from his office by the king, who granted him a pension.

SCROPHULARIACEÆ, skröf-ü-lä-rî-ä'-se-ë, an order of herbs, sub-shrubs or shrubs widely distributed throughout the world. Some botanists estimate the number of species at 2,000, among which are many well-known garden flowers, such as foxglove, musk-plant, veronica or speedwell, snapdragon, calceolaria, eyebright, mullein and salpiglossis. Other species have been used in medicine and still others are considered poisonous. They are characterized by irregular personate or bilabiate flowers, arranged in racemes or spikes or in the axils of leaves; fruits either capsular or fleshy; and alternate, whorled or opposite leaves of various forms, generally scentless but sometimes fetid.

SCRUB-BIRDS, a family (*Atrichornithidæ*) of large, brown, harsh-voiced birds of the Australian forests, nearly related to the lyre-birds; also called brush-birds.

SCRUB RACE, in American political history. In 1824 in the Presidential campaign and election the candidates were not nominated by Congressional caucus, as had been the custom. Crawford, of Georgia, was put forward by a quasi-caucus; New England's candidate was John Q. Adams, Clay was nominated by Kentucky, Louisiana, Missouri, Illinois and Ohio; and Andrew Jackson by Tennessee and other States. Jackson received the largest popular vote, but Adams was chosen by the House.

SCRUB-TURKEY. See **MEGAPODES**.

SCRUPLE. See **WEIGHTS AND MEASURES**.

SCUDDER, sküd'er, **Henry Martyn**, American clergyman and foreign missionary: b. Panditeripo, Ceylon, 5 Feb. 1822; d. Winches-

ter, Mass., 4 June 1895. He was graduated from the College of the City of New York in 1840, and from Union Theological Seminary in 1843. From 1844 to 1857 he was a missionary to India from the Reformed Dutch Church of America, and again devoted his efforts to this cause in 1860-63. His later years were spent in various cities of the United States, where he held Dutch Reformed, Congregational and Presbyterian pastorates. In 1887 he established an independent Protestant mission in Japan, together with his son and daughter, who were also missionaries. He was the author of a 'Liturgy of the Dutch Reformed Church' (1862); 'The Bazaar, or the Vernacular Teacher's Companion,' etc.

SCUDDER, Horace Elisha, American author: b. Boston, Mass., 16 Oct. 1838; d. Cambridge, Mass., 11 Jan. 1902. He was graduated from Williams College in 1858, engaged as a teacher in New York for three years, and in 1867-70 he edited the *Riverside Magazine for Young People*. He then entered business life, but soon withdrew to devote himself entirely to literature. His juvenile publications, which were widely popular, include 'Seven Little People and their Friends' (1862); 'The Bodley Books' (1875-87); 'The Book of Legends Told over Again' (1899), etc. His work was not, however, confined to juvenile literature. He edited the *Atlantic Monthly* in 1890-98, and contributed much to it, though usually anonymously; edited 'American Commonwealths'; 'American Poems' (1879); 'American Prose' (1880), and wrote 'Life and Letters of David Coit Scudder, a Missionary in India' (1864); 'Noah Webster, a Biography' (1882); 'Men and Letters' (1887); 'James Russell Lowell, a Biography' (1901), etc.

SCUDDER, Janet, American sculptor: b. Terre Haute, Ind., 27 Oct. 1873. She was educated at the Cincinnati Art School, the Art Institute, Chicago, and at the academies of Vittis and Colorossi in Paris and at MacMonie's studio there. She has lived abroad most of her life. She was awarded the bronze medal at the Chicago Exposition in 1893; and the prize medal at the Saint Louis Exposition in 1904. Her works include 'The Frog Fountain' (Metropolitan Museum, New York); 'Young Diana' (Paris Salon 1911); 'Little Lady of the Sea' (Paris Salon 1913); 'Fighting Boys Fountain' (Chicago Art Institute); and others at the Luxembourg, Paris; the Congressional Library, Washington; the Peabody Institute, and in other noted collections.

SCUDDER, John Milton, American eclectic physician: b. Harrison, Ohio, 8 Sept. 1829; d. Daytona, Fla., 17 Feb. 1894. He was educated at Miami University, Oxford, Ohio, and was graduated in medicine at the Eclectic Medical Institute of Cincinnati, Ohio, in 1856. In 1857 he was appointed demonstrator of anatomy and served as professor of obstetrics and diseases of women in his alma mater, 1858-60. From 1860 to 1887 he filled the chair of pathology and practice of medicine and from 1887 to his death the chair of hygiene, principles of medicine, physical and specific diagnosis. In 1869 he published the doctrine of specific medication, originated by him, and since that time the basis of practice of the eclectic school of

medicine. For 32 years he was editor of the *Eclectic Medical Journal*, the oldest periodical devoted to American eclectic medicine. He wrote 'Practical Treatise on Diseases of Women' (1858); 'Eclectic Materia Medica and Therapeutics' (1860); 'The Eclectic Practice of Medicine' (1864); 'The Use of Inhalations' (1865); 'Domestic Medicine' (1866); 'The Principles of Medicine' (1867); 'Diseases of Children' (1867); 'Specific Medication' (1871); 'Reproductive Organs and Venereal Diseases' (1874); 'Specific Diagnosis' (1874). He was the most conspicuous eclectic physician of his time.

SCUDDER, Samuel Hubbard, American entomologist: b. Boston, Mass., 13 April 1837; d. 17 May 1911. He was graduated at Williams College in 1857 and at Harvard University in 1862. He was custodian of the Boston Society of Natural History in 1864-70, and was its president in 1880-87. He served as palæontologist on the United States Geological Survey in 1886-92. Author of 'A Century of Orthoptera' (1879); 'Butterflies' (1881); 'Fossil Insects of North America' (1890); 'American Fossil Cockroaches' (1895); 'Catalogue of the Described Orthoptera of the United States and Canada' (1900); 'Index to North American Orthoptera Described in the Eighteenth and Nineteenth Centuries' (1901), etc.

SCUDDER, Vida Dutton, American educator and author: b. Madura, India, 15 Dec. 1861. She was graduated from Smith College, Northampton, Mass., and studied at Oxford, England, and in Paris, France. She became connected with the formation of college settlements, was instructor in English literature at Wellesley College in 1887-92 and from 1892-1910 was associate professor when she became professor of that department. She is the author of 'How the Rain Sprites Were Freed' (1883); 'The Life of the Spirit in Modern English Poets' (1895); 'Social Ideas in English Letters' (1898); 'Introduction to the Study of English Literature' (1901); 'A Listener in Babel' (1903); 'An Introduction to the Writings of John Ruskin' (1904); 'The Disciple of a Saint' (1907); 'Socialism and Character' (1912); 'English Poems' (1915).

SCUDÉRY, skü-dä-rê, or SCUDÉRI, Madeleine de, French writer: b. Havre, 15 Nov. 1607; d. Paris, 2 June 1701. She gives an account of her early life under the name of "Sapho," the title assigned to her by her contemporaries, in her romance, 'Le grand Cyrus.' At 12, she says, she was spoken of as a person of mature judgment, and much admired. On coming to Paris she was admitted to the society of the Hôtel de Rambouillet, and began to assist her brother Georges, a writer of plays, romances and sonnets, in his literary labors. Her first romances were published in her brother's name, and he doubtless assisted in the formation of the plot, or at least suggested the plan of her works. The character of the works themselves is sufficiently explained by the circumstances of their production, but their protracted popularity is not so easy to understand. Her admirers range from Christina of Sweden to Mascarón, Fléchier and Massillon. Boileau himself did not dare to publish his satire during her lifetime. Her works may be regarded

as a reflection of the society in which she moved. They consist chiefly of long romances replete with sentiments of love and gallantry; their predominant characteristic is affection.

The heroes of Mlle. Scudéry are the heroes of antiquity, Cyrus, Horatius Cocles, Mutius Scævola and Brutus. These and similar personages meet and discuss with appropriate heroines the anatomy of passion in endless conversations of the most refined subtlety.

The names of her characters were only a transparent mask behind which her readers saw and read themselves. The society of the Hôtel de Rambouillet furnished the originals for all the heroes of antiquity. Cyrus, it is well known, was the great Condé. The society of the day furnished her with endless materials and the gallantries of the preceding night formed the subject of the day's description. Thus with conversation, epistle, sonnet and madrigal she worked out a chronicle of petty intrigue under the greatest names of the world's history. After the reunions at the Hôtel de Rambouillet had been broken up by the troubles of the Fronde, Mlle. de Scudéry opened her own house to a select society on Saturday evenings. In this society, where everybody assumed a sentimental name, love was discussed, according to Mme. de Sévigné, in language so involved, that the speakers were ever in danger of being lost in their own mazes. The interminable conversations and meaningless gallantries which make her works dull at present were precisely what gave them interest when all her characters were known; and as she was admired and respected by those she portrayed, it is evident they were flattered by her portraits. Her principal works are 'Ibrahim, ou L'illustré Bassa' (1641); 'Artamène, ou le grand Cyrus' (1650); 'Clélie, histoire romaine' (1656). Besides these are numerous other romances, poems and 10 volumes of conversations and moral discussions. She obtained the prize in the first competition of the French Academy in eloquence for a 'Le discours de la gloire' (1671). See CLÉLIE.

SCUDO, skoo'dō, an ancient Italian coin named from its bearing the impress of the heraldic shield of the sovereign by whom it was issued. The scudo was of different value in different states and at different times. The recent value of the Italian scudo was about \$1. The Roman scudo was of gold and worth about \$16.

SCULLING. See ROWING.

SCULPINS, the name given to various species of spiny-rayed teleostomous fishes of the family *Cottidae*, or to the members generally of that family. The sculpins are fishes of striking appearance owing to the peculiar manner in which the body tapers regularly backward from the large, depressed head, and the large size of the fins. The mouth is large, the eyes placed so that they look more or less upward, a bony rod runs across the cheek between the suborbital and the preopercular bones, and the bones of the head are ornamented in varied fashions with numerous ridges and spines. The skin is largely naked but is often provided along the lateral line and elsewhere with bony plates or spines. All of the fins, and especially the pectorals, are of large size and the latter has a remarkably extended base of attachment. The family is a large one, embracing more than 60 genera and 250 species. Most of the species

live in the northern seas among rocks in shallow water, but some remarkable forms live in deep water. Some small species inhabit fresh waters. All are of small or moderate size and are little used for food. Among the numerous North American species the best known is the common or big sculpin (*Myoxocephalus grœnlandicus*). This species reaches a length of two feet, but is usually smaller and is abundant in the North Atlantic, on the American side as far south as New York. In the far North it approaches the coast from the deeper water in summer, but on our shores is most plentiful during the winter spawning season. The eggs are laid in large masses attached to seaweeds or rocks. Sculpins are exceedingly active and voracious and devour all kinds of animals dwelling on the bottom. The sea-raven (*Hemitripterus americanus*) (q.v.) is another noteworthy member of this family. Of the fresh-water sculpins the miller's thumbs (*Cottus*) are represented by numerous species of little fishes which dwell among stones in cold springs, brooks and lakes, laying their eggs in masses on the under side of stones and guarding them until hatched. Consult Jordan and Evermann, 'Fishes of North and Middle America' (Part II, Washington 1898); Goode and Bean, 'Oceanic Ichthyology' (Washington 1895); Gill, T. (in *Smithsonian Miscellaneous Collections*, Vol. II, Washington 1904).

SCULPTURE is the art of shaping figures either in the round out of or in relief upon various durable substances. This shaping is accomplished by modeling for wax or clay; by carving for wood, stone, marble and ivory; and by casting for plaster and bronze. The modeling of a small figure in wax—to make trial of the general effect—and of a full-sized one in clay form the first steps in life-sized or other large-scale sculpture of human subject; and these are comparable to the sketch in painting. In very large work, the wet clay is worked onto a rough framework of iron bars and coarse wires by means of the fingers aided with wooden and iron tools; and consequently allows

modeled nude, in the first place, in order to secure harmony of action between the various members whether hidden or exposed. Thus, the legs must lead to the body, as the body to the head if the figure be seated; and legs must anatomically support the body if the figure stand. The modeling must combine with this living reality such abstract beauty as is possible in the case. The plaster cast which is taken

Venus de Medici.

Achilles.

from the wet clay model is often retouched by its sculptor. Transference into marble is made by a marble-cutter aided by a pointing machine, and usually supplemented by the artist's own hands. Reproduction in bronze is done by casting in a mold, which has been made upon either model or cast, for all but colossal works like the Liberty in New York harbor, which are made from hammered plates. The bronze may be left its natural color, or be stained or gilded. The tough and durable bronze, which moreover can be cast hollow, is preferred to the brittle and—in cold climates—disintegrating marble for out-door use. But for interiors the merits are divided; the pale marble makes even delicate transitions of light-and-shade effective, while its translucence imparts softness to the exquisitely rounded surface; but the dark and opaque bronze obscures these qualities, and therefore calls for emphasis of projections and sharpening of corners to impart clearness to their shadows. Ivory in plates was sometimes used for the fleshy parts of draped statues, and ivory is now used for statuettes. Wood is used extensively in China and Japan, where its liability to warp and split is obviated by the use of smaller pieces glued together and by lacquering.

Sculpture in relief is used mostly in architectural decoration where its aid is invaluable to relieve the flatness on frieze, panel, or pilaster. In low or bas-relief, the figures project less than half the rounded form, usually much less; whereas in high-relief they exceed that limit, and then often show heads, arms, etc., wholly detached, and other parts so undercut as to appear detached. Of course, there is a

Egyptian.

great freedom of change in every detail. The small wax figure is fashioned with little or no use of a human model, but the full-sized figure is usually executed either in constant presence of one or with very frequent reference to it; not indeed to copy the living form, but to insure a general truth or keep a hold upon the possibilities of life. Furthermore, in full-sized work, even the draped figure is very generally

middle-relief between high and low, and sometimes figures are merely outlined by a groove. Relief and background are usually of the same material, but may properly be diverse.

The beauty of sculpture may be analyzed as follows: Though the mass of sculpture matters less than its form, the heroic size befits the grand subject, and pieces destined to elevated or remote location must be enlarged to corre-

Niobe.

spond, and at the same time changed in the proportions of their parts and trimmed of details. Since sculpture has the third dimension of thickness, it may be enjoyed by touch as well as by sight, precisely as acquaintances are recognizable by a blind person, and finely modeled statuary has been so appreciated in privileged cases. This solidity also renders possible an endless variety of aspects, according as the observer changes standpoint. The surfaces of the animal or human body—which commonly form the objects of sculpture—are exquisitely rounded in every direction, and the outlines which become visible when we look at these surfaces against a background are mostly curves of consummate beauty, combining lines nearly straight with others of greatest flexion; and the Philistine needs to learn that those on foot or nates are in no wise inferior to those on shoulder or head. These curved surfaces, moreover, can be expressive of underlying substances as varied as bone, sinew, muscle, flesh and veins; and when they are so, the surface is said to be sensitive, but when they are not, then puffy or monotonous. Contrast is secured by means of massively rounded forms, as of the nude, against the sharp folds of drapery and crisp locks or wavy tresses. Unity among this variety is secured by dominant lines, as in the Discobolos of Myron, where an approximate semi-circle may be traced from the discus, along the right arm, across the shoulders, down the left arm and left leg, to the left foot; while the bowed trunk and bended right leg show a zigzag quite as plainly.

The effect of the single color in bronze and of the absence of color from marble and plaster

is to concentrate attention on the form and line of sculpture, which on that account is enjoyed by certain temperaments more than is painting, and can be utilized by all as special opportunity for a revel in line. But the injury both given and received by a large patch of white among the colored objects of a picture gallery or parlor is undeniable, and should be remedied by investment of the marble statue or relief with some warm tint, as was apparently the practice of the Greeks at all periods. Failing such remedy, the distraction of the gleaming and ghostly marble should be precluded by assigning to it a separate recess or room. But in general the tinting is preferable, since sculpture can then be admitted to the company of flat walls and pictures which its projection will greatly relieve, while they also aid it. Statues and reliefs never appear to such disadvantage as when jostling each other in a store or museum, where numbers satiate, rivalry discounts and nothing serves as a foil.

The element of light-and-shade becomes important in that mainly through it form is revealed to the eye. This in turn requires that the sculpture should be modified to suit the lighting available, namely, as it comes from either side, from the front, or from above; while of course it should never come from the back, though statuettes placed in windows cause that very effect. A brilliant play of such light-and-shade is the only peer to beauty of line in sculpture; and is often referred to by sculptors under the misnomer "color," as if to make amends thereby for the absence of color from modern sculpture.

As in all other arts, worthy meaning or significance should be wedded to the beauty of

Papirius and Mother.

sculpture; but here the case has peculiar strength. Since sculpture is solid, it must fully express or exhibit the form of whatever it shows, whereas painting can merely suggest an object, which is indifferent or repulsive in itself, and throw around it the glamour of light or color. Sculpture is, therefore, limited to such subjects as are capable of exciting interest

by their forms taken separately, although it must not be forgotten that form is explained to the eye by delicate gradations of shade, the surfaces seeming tinted in this way as they receive light more or less directly. The nobler animals, and especially man in the typical activities that become him, form the subjects of the separate or independent sculpture most in fashion in the 19th and 20th centuries. Sculpture of such character as this is necessarily the highest in rank. This characteristic of sculp-

The Dying Gaul.

ture reaches its maximum in the undraped human figure, which must, therefore, belong to the noblest type both physical and mental, that is, in both beauty and significance; but when it so does, proves a very gospel of art in the uplift to finer sense and sentiment which it elicits from the normally minded observer. Sculpture is also the noblest of the decorative arts as well as that the most constant in use in all ages. Architectural sculpture occupies itself largely with vegetal forms, mingling with them animal and human forms freely treated;

erected within and without with scenes from the victories and consequent offerings to the god made by a king. The workmanship on some of the hardest stones known was superb and achieved only with immense toil, to lessen which the statue was generalized as much as possible, though at the same time made to express the salient traits of the subject. The *ushabti*, on the other hand, called for a realistic portrait, and this was achieved in the softer material with great skill. All of the reliefs and most of the statues received a decorative coloring. Curious conventions gave part of a figure in profile, but part full face; and principal objects, like gods and kings, were represented larger than their fellows.

Chaldean sculpture showed great technical skill as early as the fourth millennium B.C. The tomb had little importance, since the corpse was burned, but temples sheltered idols in stone, and palaces contained demoniac images, royal statues and historical stelae. Stone was used for the larger pieces, terra-cotta for the smaller. The Assyrians adapted Chaldean art traditions, but gave chief attention to the palace where reliefs depict a king in war or the chase. The style excels in vigor and movement especially in the representation of animals, but lacks variety and ignores the life of woman. The art of Egypt and Assyria was carried by the Phoenicians both eastward and westward, and proved of special moment in the development of the Greeks.

The wide distribution of the Greeks in Europe, Asia and Africa combined with their tribal distinctions to favor a healthy rivalry in the arts. The largest and chief classes of sculpture consisted of, first, free statues, some of

Elgin Marbles from the Parthenon, Athens.

and finds its highest reach in the nobly designed human form with its drapery, as in the Caryatid porch of the Erechtheum and the portals of Rheims cathedral.

Egyptian sculpture, whose first monuments date from the fifth millennium B.C., forms, with that of Chaldea-Assyria, the two tap-roots for subsequent tradition in Europe. Tomb and temple are responsible for the great mass of Egyptian sculptures. Religious belief held that survival of the *ka* or spirit after death depended upon preservation of the body (as a mummy), or failing that, upon provision of a *ushabti* or sculptured portrait. Scenes from the past and future life of the deceased were also sculptured upon the wall of his tomb. Temples were cov-

ered with representations of divinities, others votive offerings, portraits set up at tombs and the like; and secondly, temple reliefs, but there also appear civic monuments and others celebrating the life of a sovereign or statesman. Terra-cotta figurines with mythological and sometimes grotesque subjects, were fashioned for the home, and stelae (sculptured slabs) to mark the resting place of the departed. Statuary of rough material or crude execution was colored generally, as where the terra-cotta statuettes have their garments colored throughout, but finer works received intense color to express or emphasize details, as the border or pattern of a cloak, while a tint was spread over the whole. Gold, silver and bronze were both

hammered and cast into statues, which were then variously inlaid and provided with realistic eyes. Wood was carved and then painted or else covered with metal plates; and wooden figures made to be covered with drapery were fitted with heads and hands of finer material. Terra-cotta, which ranked with wood as the earliest material used for sculpture and largely in architectural accessories, was also painted in

part or whole. In all Greek sculpture, therefore, the finished work was polychromatic.

Crude statuettes remain from a Greek prehistoric stone age, 2500–1500 B.C., and stone reliefs from the Mycenaean bronze age, 1500–1000 B.C. Incursions of Hellenic tribes from Thessaly led to transition and progress, until by the 6th century sculpture in marble and bronze had become a national art, of which there were two types. The Ionic preferred rounded forms, slender proportions, light draperies revealing the figure; and organic groups. It quickly developed the draped female figure. The Doric type shows sturdy, muscular forms, heavy draperies and figures merely juxtaposed. It developed the nude male figure. But Athens drew sculptors from both sources, and thus combined grace and force to form a third school, the Attic. The 5th century witnessed achievement of a mastery that allows interest in prior work elsewhere only in so far as it contributed to this, and that has remained until this present time a source of perennial delight and instruction. We are told that Polykleitos brought his athlete carrying a spear, the Doryphoros, to such perfection as to furnish a canon or standard for all such subjects. Myron showed fine naturalism in his Discobolos, and the artists who worked under the direction of Phidias combined figures of unsurpassed dignity and beauty into coherent compositions, such as those on the pediments, metopes and friezes of the Parthenon. The 4th century saw a movement toward slender proportions and graceful line, especially with Praxiteles, as in his Hermes and the Aphrodite of Knidos. The Apoxyomenos of Lysippos, probably well represented by the

marble statue in the Vatican, which is assumed to be a copy of the lost original, shows the same qualities, in contrast to the Polykleitan canon. Scopas is said to have excelled in expression of spirited action whether as boar hunt or bacchante. The Aphrodite of Melos, in the Louvre, free equally from shame and coquetry, and uniting superb form with facial expression, belongs to this or a century later. The 3d and 2d centuries saw the diffusion of Greek art over the known world, and the various modifications consequent upon it. The friezes on the altar of Zeus at Pergamon exhibited originality of design and vigorous action; and akin to them are such statues as the Apollo Belvedere, the Diana of Versailles and the torso of the Belvedere. The group known as the Laokoön belongs to the same general type and period, the ripe autumn of Greek art, but not in any sense a degeneration.

The Romans as a race were deficient in plastic sense. Sculpture appealed chiefly to their personal ambition as portraiture, which under the early empire reached a realistic perfection never before attained. Relief was the next most

Michael and Satan—Flaxman.

practised branch of sculpture, and reached great excellence as decorative art and as commemorative representation, in such monuments as arches and columns, especially those of Trajan. Roman taste for imaginative sculpture depended almost entirely upon Greek sculptors resident in Rome and upon Greek masterpieces, which were transported thither in great numbers from the entire Greek world. Finally, sculpture de-

clined along with the Roman Empire, until in the 4th century A.D. not even fair copies could be made.

Early Christian art, which extends from the 3d to the 6th centuries, found use for sculpture only on sarcophagia, where scenes from the Old Testament were depicted in high relief by artisans rather than artists. What the barbarian incursions did to break the continuity of artistic tradition in the West was accomplished in the East by the Iconoclast persecutions, so that Byzantine sculpture from the 7th to the 9th century calls for no further notice.

Mediæval sculpture, from the 8th to the 14th centuries, had various fortunes in Italy and the North. In Italy it was applied as relief to the decoration of church furniture such as pulpits, altars and fonts; whereas in France and Germany both reliefs and statuary formed an integral part of the Gothic architecture on portal and façade. Sculpture, founded upon classical models, was revived in Italy near the middle of the 13th century, under the leadership of Niccola Pisano. His son, Giovanni, felt the influence of northern schools and introduced thence the allegorical and symbolic qualities of Gothic. His successor, Andrea Pisano, led the Gothic school in Italy to the highest excellence it attained. His breadth, vision and technique transformed sculpture precisely as these qualities in Giotto did the contemporary painting. The worthy successor of Andrea Pisano was Andrea Orcagna, a genius who gave less attention to sculpture than he did to its related arts.

Victory — Rauch.

Caractacus — Foley.

The splendid development of stone sculpture in France, from the 11th to the 14th centuries, occurred in its application to the exteriors of Romanesque and notably of Gothic cathedrals. Front and side portals and façade niches were crowded with life-sized or colossal statues, while archivolts and tympana were filled with high reliefs. This subordination of sculpture to architecture involved loss of freedom

and sacrifice of details, but the earlier severe stiffness had been overcome by the 13th century, when new buildings were in progress all over northern France. The thousands of figures on such cathedrals as Chartres, Rheims, Amiens and Notre Dame were planned to visualize the encyclopedia system of mediæval theology. Almost no artists' names are known, and the scanty data indicate that while the ablest masters went to nature and to human models, both nude and draped, the mass of sculptors followed canons of form and pose prescribed for them by these masters, who must also have superintended the whole composition. These French sculptors of the Gothic period acquired the same technical mastery over stone as did the Greeks of the best period; and, like them again, were fond of polychromy, though this has only lately been recognized by historians of art. French sculpture of the late 13th and the 14th century loses in dignity, but gains in charm, humor and dramatic effect.

Mediæval sculpture of stone achieved no such results in Germany as it did in France, but excelled all other European countries in metal sculpture for church furniture, as it did also in goldsmith's work, where it followed early Christian and Byzantine models. In the 12th century German sculptors applied stone statuary to the enrichment of cathedral interiors, especially about the choirs; and in the 13th century, under French influence, extended this enrichment to the exterior, but the figures were both fewer and soberer, copying French lightness and grace only in the Rhenish school. About the middle of the 15th century, naturalism in wood carving for altar-pieces, etc., displaced the formalism of this architectural sculpture.

The Renaissance in sculpture, as in the other arts, took place in Italy, whence it was carried to other countries. Powerful families now displaced the community in patronage of art, just as the single artist did the school in its production. Associated with this individualism was the naturalism that showed itself both in the choice of contemporary subjects and in change from a conventional to a naturalistic treatment of forms. Both were powerfully promoted by the revival of classic subjects and forms, which is signified by the term Renaissance. In point of form, however, the modern sculpture was more nearly pictorial than the classical as a whole. The 15th century was one of transition, the 16th felt the full sway of the new spirit. In both these centuries the subjects most in demand remained religious for the lavish decoration of churches both exterior and interior, in both relief and the round. But squares and gardens, palaces and houses, also shared in the exuberance of restored art. The religious subjects were of necessity drawn from the Scriptures and the legends of the saints, with the Madonna and Child by far the most popular. But civic and domestic sculpture frequently employed classic themes, and wealthy persons resumed the Roman practice of collecting antiques. Bronze came again into general use, and the demand for refined form favored marble among the stones. The intensity of white marble was toned down by use of wax, and details such as hair and ornaments were usually gilded. Terra-cotta and the still cheaper stucco displaced marble in works destined for

country towns; and reproductions of masterpieces often reached the common people by this means.

Only the chief sculptors can here be selected for brief notice. The leadership among eight distinct schools of sculpture during the 15th century was held by Florence. Its masters during the first half of that century were Ghiberti, Donatello and Luca Della Robbia. Ghiberti's

English Gothic Sculpture.
From Peterborough Cathedral. From York Cathedral.

masterpiece was the bronze doors for the baptistry at Florence in which sculptural perspective and harmonious composition called forth Michelangelo's encomium. Robbia showed masterly composition in his choir-gallery reliefs, and founded a school of glazed terra-cotta sculpture. Florentine masters during the late 15th century were Desiderio da Settignano, Benedetto da Majano, and Mino da Fiesole in marble, and Verrocchio and Pollajnolo in bronze. Desiderio was distinguished for a harmony and refinement much emulated by his contemporaries. Verrocchio's masterpiece was the equestrian statue of Colleoni in Venice, reputed to be the finest extant. The Milanese school indulged a taste for luxuriant decoration in terra-cotta, and the Venetian for rich, graceful forms that appealed to emotion.

The high Renaissance, nearly contemporaneous with the 16th century, brought to sculpture an influence over its sister arts of architecture and painting that it had never before enjoyed. This sculptural treatment went to excess when statuary overbalanced the architectural construction of a wall tomb or even of an entire façade. In sculpture itself dignity of design yielded its late prominence to modeling of surface, posing of arms and legs, and the movement of drapery, all aimed at greater effectiveness. Other artists of the period were overshadowed by Michelangelo Buonarroti, a master equally of architecture, sculpture and painting, but sculptural in all; for his dominant interest was with the nude human form. His chief sculptures in his best manner are the Moses, the Two Slaves and the Medicean

tombs at Florence. Each is but member of an incomplete whole. The freedom of modeling developed in marble by Michelangelo was paralleled in bronze and goldsmithy by Benvenuto Cellini and Giovanni da Bologna. Cellini's masterpieces consist mostly of smaller decorated objects, but larger works are the Nymphs at Fontainebleau and the Perseus at Florence. Bologna treated classic themes with great freedom and grace. During the decadence of the 18th and 19th centuries, sculpture ran riot in Italy, both as to quantity and quality. Dignity and repose were displaced by dramatic emotion and movement. Lorenzo Bernini swayed 17th century sculpture by pandering to this theatrical taste.

The Renaissance in other countries than Italy was no rebirth, but simply an importation of the new Italian style and modification thereof by the national spirit. In France, where the splendid Gothic impulse had not yet expended itself, magnificent work was done by such sculptors as Michel Colombe, Ligier Richier and the unknown artists of the churches at Abbeville and Saint Riquier; but the Italian style found a welcome in the actual person of numerous Italian sculptors. The 16th century witnessed the transformation or erection of great châteaux, public buildings and churches, all of which called for sculptured decoration after the early Renaissance style. The great sculptors in this work were P. Bontemps, J. Goujon and G. Pilon, among whom Goujon especially displayed the new harmony and elegance. In the 17th century the tendency was to superficial pomp of the Versailles type, which characterizes the work of F. Girardon and P. Puget and of their successor, N. Coysevox, at the beginning of the next century. This

Night—Schilling.

grand art of Louis XIV was succeeded by one of grace and delicacy in the course of the 18th century, when J. B. Lemoyne, E. Bouchardon, J. B. Pigalle and J. A. Houdon did their work, the last named especially in portraiture.

The Renaissance movement in other countries offers little interest. In Germany it reinforced the naturalistic movement already begun there, but was accepted slowly especially

in the northern part where Gothic influence from the Netherlands continued. In the 16th century forms peculiar to Flemish Renaissance mixed with those of the Italian throughout Germany, and in the 17th and 18th centuries the Rococo style of the Romanists shared the field with the bareness of the Protestants.

The Netherlands combined Italian with its native style in the 16th century; Austria followed in the wake of Germany; while Spain and England depended upon imported Italian artists, until the 17th century, when native sculptors appeared. In England, N. Stone supplied sculpture for many buildings designed by Inigo Jones, as did G. Gibbons for others by Sir C. Wren. All important English works of the 18th century were executed by Flemish or French sculptors, but toward its close John Flaxman started a home revival by his exquisite reliefs for Wedgwood pottery.

EDMUND BUCKLEY,

Editor of 'University Lessons on Art.'

SCULPTURE, Education in. We know little of the education of the sculptor in ancient Greece, and can only guess at the training which produced the greatest sculptors the world has seen. In the Middle Ages and the Renaissance education in sculpture proceeded on much the same lines as education in painting, the young sculptor entering the workshop of a master and learning thoroughly all the mechanical parts of the trade before he attempted anything in the way of independent study of nature. To-day the education of the sculptor is organized in the same way as that of the painter and the student has much the same training in the observation of nature and much the same lack of training in the essentials of art. There are, however, certain differences between the conditions under which sculpture and painting are carried on in modern times which seem to favor the education of competent craftsmen in sculpture. The mere bulk and weight of material involved in the creation of heroic statues or groups makes it inevitable that the sculptor should have some assistance, and most prominent sculptors are more like the heads of mediæval shops than are almost any modern painters. Apart from the more or less illegitimate employment of what are known as "ghosts" (that is, artists, often, of more ability than the employer, who actually produce the work for which the employer secures the commission and appropriates the rewards), a sculptor may have a corps of perfectly legitimate

helpers who vary from the mere studio boy of the caster to the accomplished modeler. Many young sculptors thus pass through the studios of their seniors and gain invaluable experience in the actual production of works of art which is supplemented, either before or afterward, by education in a regular school of art. Such a double training is the best our time has to offer, and is certainly far better than either an apprenticeship or a term of study in an art school taken singly, but it is not yet an ideal training.

The technique of sculpture, as far at least as regards the handling of the clay or wax model, is an infinitely simpler thing than that of painting. There are no complicated processes to master, no questions of the chemistry of pigments, of the optical effects of colors on each other or of the different qualities of reflected and transmitted light, such as are involved in the manipulation of paint. Modeling is a matter of knowledge of form and facility of hand, and both the knowledge and the facility might be attained as readily in the school as in the studio, for there is so much rough manual labor to be done in a sculptor's studio that a helper might work there for years without doing much real modeling. And the technique of modeling is, after all, of relatively little importance; for the sculptor, unlike the painter, puts his personal handiwork upon a thing destined to be destroyed and never to be seen by the public. He works in clay or wax while it is the interpretation of his work in marble or bronze that is set before the world, so that he is almost in the position of the draughtsman upon the wood block, whose work ceases to exist and is replaced by that of another. The sculptor of the Renaissance was either a stone carver or a bronze founder or both, and the craft he practised was the craft of carving or of metal working, the modeling being only a preliminary and being sometimes dispensed with altogether. The modern sculptor tends to become a modeler and to put all his strength into the clay, the final carrying out of his ideas being largely entrusted to others, and his knowledge and invention count for much more than his skill of hand, while the worker in stone or bronze rarely becomes an original artist. Of course the best of our sculptors do not only control and oversee the final carrying out of their work, but actually put hand to it themselves, at times, and even when they do not they must vary the manner of modeling they employ according to the material of the definitive work, and these variations of manner they will teach their assistants. Also there is a great deal to be learned in a sculptor's workshop hardly likely to be picked up elsewhere, were it only the mechanics of setting up great armatures, the processes of pointing and enlarging small models and the rest. Still there is some tendency to a divorce between the original artist and the workman, and it is difficult for the modern sculptor to become a thorough master of his craft, thinking naturally in stone or bronze rather than in clay.

There is another respect in which the education afforded by the apprenticeship of the Renaissance was greatly superior to that obtainable in a modern studio. The Renaissance master was often a painter as well as a sculp-

tor and, not infrequently, an architect as well, and the essential unity of the three great arts of design was inevitably impressed upon his pupils. The modern sculptor rarely knows anything of painting or architecture, and his studio assistant has little opportunity even to learn drawing, the foundation of all the arts. If he would learn to draw he must study in an art school, and he is generally encouraged to do so in such time as his necessary work leaves at his own disposal. In the modern art school the students are allowed, or even required, to change from class to class, and their chance of acquiring some notion of the interdependence of the arts, and some breadth of artistic culture, is greater than that of the mere studio assistant. Such interchange of work between drawing or painting and modeling would be of great benefit to the painter also, if he more often took advantage of it, but is hardly as essential to him as to the sculptor.

In some measure, then, the schools offer a valuable supplement to the training of the studio, but they do not give nearly all that they might or should give. Of the true meaning of composition, and of the difference between artistic expression and imitation, the school, at its best, can give no such idea as can the studio, where the actual production of a work of art, through all its stages, may be watched. Yet the students might be encouraged and aided in the actual carrying out of original work, taught something of the difference between the use of the model for the attainment of a predetermined result and the mere copying of a set pose, and, possibly, instructed in casting, pointing, marble cutting and even bronze founding and chasing and the production of various patinæ. He should, assuredly, be given a thorough training in ornament and be taught more than he is of the history of art and the development of styles. A thorough mastery of drawing cannot be too much insisted upon. Of course the constant study of modeling from the living figure would continue to be the principal element of training, but it would be well if some study of drapery and costume could be added to it. The graduate of our art schools, either painter or sculptor, generally knows little or nothing of the arrangement of draperies and this is one of his most serious deficiencies.

Such a course of instruction as is here sketched has been attempted, but has never been thoroughly worked out in our schools. It could hardly fail to prepare the student for more efficient service in the studio of a master than he is now generally able to give, and to enable him to acquire more surely and rapidly that practical knowledge of real work which no school, however managed, can supply. See ARCHITECTURE, EDUCATION IN; PAINTING, EDUCATION IN.

KENYON COX.

SCULPTURE OF THE 19TH CENTURY. The beginning of the 19th century found classicism dominant wherever the art of sculpture was practised. Canova, now 43, was the recognized leader and was destined to hold his position as an amiable dictator until his death, 22 years later. Thorwaldsen was already in Rome acquiring the elements of his more virile art. The works of the antiquarian Winckelman had been translated from the German into various languages and with the

etchings of Piranesi had carried the worship of the antique into distant lands. All Europe was "doing Greek," as it fondly imagined. Simplicity was the watchword; a simplicity which to-day seems as amusingly ostentatious as the theatrical art which it displaced. Canova was followed by a large brood of disciples of whom Giuseppe Fabris alone requires mention. The realistic impulse of the time was represented by Lorenzo Bartolini (1777-1850), whose sculpture, while often literal, revealed a new vitality. Pietro Tenerani also left works of interest. The first really to belong to the 19th century was Giovanni Dupré (1817-82), who was strong enough in personality to put soul into his very realistic works. Giulio Monteverde likewise struggled to express ideality in terms of realistic imitation. Antonio dal Zotto, of Venice, a pupil of Ettore Ferrari of Rome, made many public monuments, among them his vivid 'Goldoni' of Venice. Vincenzio Vela (1820-91), whose naturalism was liberally leavened with imagination, is best known to us through the 'Last Days of Napoleon' in the Corcoran Gallery. Of contemporaries, Vincenzo Gemito (b. 1852) is typically Neapolitan, while Ernesto Biondi (b. 1855) has run the gamut of subjects and treatments from 'The Saturnalia' to 'Les Recluses Misérables.' Most idealistic of all modern Italian sculptors is Lorenzo Bistolfi (b. 1859), of Turin, "the poet of Death," whose 'Grief Comforted by Memory,' and 'Sacrifice' — the latter on the national Victor Emmanuel Memorial at Rome — show forth the beauty of his sculptural thoughts.

In France the opening of the 19th century found the great master Houdon at the age of 59 still producing those vivid portraits which have made his fame. His airy 'Diana,' the ever admirable 'Voltaire' and the stately 'Washington' of Richmond, Va., had been completed, however, a few years earlier. Among the orthodox classicists of the time were Bosio, Cortot, Chaudet, Giraud and Pradier, all men of skill but with little to say. Their art seems to us singularly colorless and anemic. Three names stand pre-eminent in the first half of the 19th century: David d'Angers, Barye and Rude. Pierre Jean David (1789-1856) — called "of Angers" to distinguish him from his namesake the painter — is remembered for his hundreds of medallion portraits of contemporaries and for the austere pedimental group of the Paris Pantheon. Antoine Louis Barye (1796-1875), the great interpreter of animal life, was a patient and perhaps unconscious revolutionary. Coming in a period of convention, no less exacting in matter of themes than in manner of treatment, his novel works were inevitably met with disapproval. Following an untrodden path, he made no mistakes; whatever he touched became true sculpture. Before his death his recognition was complete. The greatest personality of this period was François Rude, who was born at Dijon in 1784 and died in Paris in 1855. Rude imagined himself a classicist and tried to be one; but his art at times transcends schools, and once at least he becomes sublime. 'The Departure' upon the Arc de Triomphe (1832-35) is the greatest achievement, the most inspired work ever wrought by a French sculptor. Rude's brilliant pupil, Jean Baptiste Carpeaux (1827-75), worked with a feverish touch and threatened to

set all of the statues of Paris a-whirl on their pedestals. 'Flora' of the Tuileries, 'The Dance,' of the opera, and the crowning group of the Fountain of the Observatory are the most important examples of his restless but fascinating art. Another pupil of Rude to win eminence was his nephew, Emmanuel Frémiet (1824-1900). Like Barye he was known as an animalist, but he modeled the human figure with complete authority. His various startling tragedies of the jungle are well known, but a more lasting fame will be based upon his equestrian 'Joan of Arc' and particularly his 'Louis d'Orleans' of Pierrefonds Castle.

A great quickening of sculptural activity was destined to follow the modest and almost reticent leadership of Paul Dubois (1829-1905). Chancing to find his *métier* too late to aspire to the Prix de Rome, he went to Florence for independent study and there was profoundly impressed by the art of the 15th century, especially the works of Donatello and Jacopo della Quercia. In a sense he re-discovered this period to France. He modeled and exhibited in 1865 his 'Young John the Baptist,' its cordial reception being soon shared by the well-known 'Florentine Singer.' As a result he was entrusted with a very important commission, the tomb of General Lamoricière for the cathedral of Nantes. Completed in 1878, this work received in the exposition of that year the highest honors, and Dubois was recognized as the head of a new movement distinctly inspired by the early Italian Renaissance. Men of like sympathies grouped themselves around him, and the '70s and early '80s saw a succession of notable works from such masters as Henri Chapu ('Joan of Arc'); Ernest Barrias ('The First Funeral,' 'The Defense of Paris'); Eugène Delaplanche ('L'Aurore,' 'La Musique'), and René de Saint-Marceaux ('Genius of Death Guarding the Secret of the Tomb'). Alexandre Falguière constantly oscillated between themes spiritual and themes "frankly carnal." Antonin Mercié, another gifted southron, had sent his 'David' from Rome in 1872 and followed it in 1875 with his 'Gloria Victis,' a distinctly national expression. With these men as leaders and an army of others trained as only French sculptors are trained, the art assumed an unwonted importance, attracting the attention of the world. Some have even claimed that this manifestation was worthy to be called the third of the great historic epochs in the history of sculpture.

Strength is ever followed by decay; virtuosity takes in time the place of inspiration. No advance is ever so successful that it has not an opposition movement in its shadow. Some of these great artists became careless in their work. Some stopped thinking, although their wonder-working hands toiled on. Nearly all of them made regrettably incoherent public monuments in the style of Dalou's dizzy 'Delacroix.' Their followers were left in a particularly sad plight with no one to think for them. Between an art of meaningless vehemence on one side and meaningless grace on the other, the unintelligent imitator found himself helpless. It was time for a new leader. Rodin's remarkable nude, 'L'Age d'Arain,' was first seen in 1877, to be followed two years later by the still more unconventional 'John the Baptist,' a work so intense and so starkly

human that it caused many a shudder and many a protest. It was the reaction that had to be. Elegance and carefully composed limbs gave way to as carefully planned crudities. The 'Balzac' and the 'Burghers of Calais' arose rude and impregnable where erstwhile had reigned the smiling graces. The 'Gates of Hell,' in which their author attempted to picture all the sins of humanity, were never to be completed, but from them poured forth a long series of works culminating in 'The Thinker.' The years moved on and the master's hand became impotent, his utterance faltering; yet stranger things, ranging from amorphous puerility to a realism akin to taxidermy, have been brought forth by his imitators. Among these, Boudelle and Maillot are apparently the most virile. A great spirit is Paul Albert Bartholomé, the painter turned sculptor, whose monument 'Aux Morts' rewards one's visit to the cemetery of Père Lachaise. Carved in broad, simple planes in the Paris limestone, it has been an object lesson to many young sculptors weary of realism or of factitious grace. Among these men of promise—and of fulfillment—are Henri Bouchard, Paul Landowski, François Sicard, Roger Bloche, Jean Boucher and others.

Many of the able sculptors of France leave but a single work of great value. Competition is fierce and opportunity comes but once. With Aubé it was his superb 'Dante' rather than the restless Gambetta monument. Lanson's 'Age de Fer,' Massoule's 'Un Ancêtre,' Escoula's 'Le Baton de la Vieillesse,' Damp's 'Le Baiser de l'Aieule,' Longepied's 'L'Immortalité,' Gustave Michel's 'La Pensée' are among the works which come readily to mind. The animalists were never more numerous than to-day. Frémiet and Cain were followed by a host of whom Georges Gardet is best known. Even more numerous are the modernists led by Chaplain and Roty. Eclecticism guides modern French sculpture. Individualism is supreme. Temperament alone, whether displayed through romanticism or through naturalism, has guided expression. The result is the most varied art the world has yet seen. These French masters represent a living force and their achievements form a splendid contribution to the art of our time.

Spanish sculpture remained long out of touch with the modern world. To-day Barcelona and Seville boast a number of skilful men whose works have much in common with recent Italian productions. Augustin Quérol (1863-1909) was popular, but his monuments are extremely flamboyant. His statue of Francisco de Quevedo in Madrid is, however, admirable. Mariano Benlliure made interesting monuments to Martinez Campos and Sagasta, while some of his architectural decorations are very fine. Aniceto Marinas combines with much fluency a truly southern delight in detail, but is surpassed by Ricardo Bellver who is prodigal in realistic accessories. Much freer from this fault is Miguel Blay, a pupil of Chapu, who has done much good realistic sculpture. An idealist of truly poetic inspiration is José Clara.

Modern Belgian sculpture begins with the names of Guillaume, Geefs, De Bay and Simonis, all of whom more or less ably fought against the influence of the then dominant

classic school. Paul de Vigne (1843-1901) was an idealist who produced many beautiful works. Charles van der Stappen (b. 1843) expressed himself largely in architectural sculpture. Thomas Vinçotte likewise did much to decorate the beautiful city of Brussels. Jef Lambeaux (1852-1918) was an artist of unusual vigor and originality; his latter works, however, became exaggerated and gross. His female figures seem to have been inspired by Rubens. Joseph Dillens has brought forth work of more uniform excellence. The austere yet sympathetic productions of Pierre Braecke point the way to Constantin Meunier (1831-1910), who is undoubtedly the great figure in recent Belgian sculpture. His art is that of Millet the painter, one of intense sympathy for the laboring man and an almost classic simplicity of rendering. His figures and reliefs of miners and iron workers; his statues of 'The Mower' and 'The Dockhand' are known everywhere and are truly sculptural conceptions grandly realized. J. Van Biesbroeck of Ghent, the Socialist sculptor, has also glorified labor in many impressive works, notably 'The People Mourn,' in the Luxembourg. Of the many clever men remaining but two can be named—two who represent the antipodes of ideals: Victor Rousseau, who in such graceful compositions as his 'Adolescents' and 'Sisters of Illusion,' exemplifies the traditional standards at their best, and George Minne, the poet and mystic, whose haggard art is at this time even more appealing.

The name of Bertel Thorwaldsen (1770-1844) looms large not only in the annals of Denmark, but in the history of modern sculpture. His art was Italian, though he believed it to be Greek. He brought to it the robustness of a strong-bodied, simple-minded peasant, and his life work contributed in no small degree to the great advance of sculpture. While he had little charm and little color sense, and personality is carefully obliterated from his ideal works, there remains nevertheless a simple, manly directness in his approach to every subject which wins our respect. What he created was always sculpture.

Thorwaldsen left no successor in his own land. The Norwegian Stefan Sinding (b. 1846) brought a new fame to Copenhagen, his adopted city. His 'Captive Mother' and 'A Man and a Woman' are elemental and truly great works. Per Hasselberg of Sweden (1850-94) was an artist of poetic gifts. His 'Snowdrop' and 'Frog Girl' are well known in America. Karl Milles and Carl Eldh are to-day prominent in Sweden.

The English have long patronized sculpture but have not until recently produced notable works. It was the French element which designed and decorated the noble cathedrals of England. John Flaxman (1755-1826) was one of the first Englishmen to win distinction in this essentially southern art, and his valuable contribution was largely in the form of designs for low reliefs. The many monuments by Sir Richard Westmacott (1775-1856) and by Francis Chantrey (1782-1841) resemble those executed by Flaxman. John Gibson (1791-1866) was a pupil of Canova and his work shows much of the grace and delicacy of his master. Alfred Stevens (1817-75) approached grandeur in his Wellington memorial in Saint Paul's.

Thomas Woolner, Hugh Armstead, J. H. Foley and Edgar Boehm were prominent in their time and were succeeded by Thomas Brock (b. 1847), Hamo Thornycroft (b. 1850), Onslow Ford (1852-1901) and Alfred Gilbert (b. 1854), men of much ability. Others notable to-day are Alfred Drury (b. 1857), Sir George Frampton (b. 1860), Bertram MacKenna (b. 1863) and Gilbert Bayes (b. 1871). A considerable number follow the example of Alfred Gilbert in uniting pure sculpture with an intricacy of detail such as wrought iron "entanglements" and combinations of enamels and richly chiseled metals, attaining in the side-lines of the art to very great dexterity. Several British painters have in the past turned with considerable success to the sister art; both Watts and Leighton did distinguished work, as did also, in animal subjects, Landseer and Swan.

German sculpture of the early 19th century offers but two or three names of importance, Gottfried Schadow of Berlin (1764-1850), a man of considerable talent, was somewhat eclipsed by Christian Rauch (1777-1857), a sculptor whose art was a perfect expression of his people and the time in which they lived. His monument to Frederick the Great in Berlin is an impressive work believed by many to mark the highest point reached by German sculpture. Rauch was assisted and succeeded by a number of pupils, among whom Friedrich Drake was perhaps the most gifted. Albert Wolf executed the 'Horseman attacked by a Lion,' of the Berlin Museum; its more famous companion group, the 'Amazon and Panther,' was made by Augustus Kiss (1802-65). An artist of exceptional refinement was Ernst Rietschel (1804-61) of Dresden, who glorified poets rather than warriors. Among his works are important monuments to Lessing, Goethe and Schiller at Weimar and to Martin Luther at Worms. Encke and Schaper, Hähnel of Dresden, and Bläser of Cologne likewise made contributions of value. Germany's love of the colossal began to reveal itself in such gigantic figures as Schwanthaler's 'Bavaria' in Munich, Schilling's 'Germania' in the Niederwald and Bandel's 'Hermann Arminius' in the Teutoburg Forest. Reinold Begas (1831-1911) was the favored sculptor of the new empire. His pompous and restless monument to William I in Berlin is an example of his "official" art; his 'Bismarck,' in the same city, is even less happy. Joseph Uphues has skill and better taste. A veteran of Munich is Adolf Hildebrand (b. 1847), highly esteemed even by the new and insurgent generation. His Wittelsbach fountain in Munich is especially notable. Another whose work is always dignified is Louis Tuaillon, famed for his two equestrian statues of the Emperor Frederick and a fine 'Amazon.'

Of a type quite different from any of these is the massive and archaic treatment to-day dominant in German sculpture. One of its most complete expressions is the enormous 'Bismarck,' which, like a grim sentinel, overlooks the city of Hamburg. It is the work of Hugo Lederer (b. 1871), an Austrian by birth, who has designed several of these impressive memorials in which the sculpture becomes an organic part of the architecture. The Kyffhäuser memorial is another cyclopean effort with a figure of 'Barbarossa' by N. Geiger. No one

has practised the new and strange sculpture of Germany with greater virtuosity than Franz Metzner (b. 1870), another Austrian established in Berlin, whose works abound to-day in all northern Germany. The greatest of these will be found in the Leipzig Völkerschlacht memorial, which has been characterized as "the most complete embodiment of brute force—of the power to crush—that architecture has afforded since the pyramids."

Among the many younger men who followed the new-old archaistic movement are Hermann Haller, Hans Damman, Georg Kolbe, Arthur Lange, Bernhard Hoetger and Ludwig Habich of Darmstadt; Benno Elkan and Hermann Hahn of Munich. Theodor Georgii of the latter city is apparently content to do good sculpture without tinge of the momentary fad. A leader in animal sculpture is August Gaul (b. 1869). Certain German painters, notably Franz Stuck and Max Klinger, have attracted much attention through their experiments, especially in polychromatic sculpture.

Austria is prolific in sculpture, even supplying many leaders to Germany. The traditions of Vienna are of a florid art, as illustrated in the well-known frieze, 'The Triumph of Bacchus and Ariadne,' in the Court Theatre, the work of Rudolph von Wehr. Earlier, however, in the century come the names of Prof. Franz Bauer, the brothers Hans and Joseph Gasser, Anton Fernkorn, Johann Meixner and Kaspar von Zumbusch. Of the succeeding generation were Edmund Hellmer and Victor Tilgner and the ingenious Arthur Strasser. Among the many able men of to-day are Karl Stemolak and Karl Krikawa. Prague has its own abundant tradition; examples range from the stately Wenzel monument to the fascinating works of Jan Sturza. Nicholas Ligeti and Géza Maróthi are honored names in Budapest. Cracow likewise presents a varied record of recent tendencies, among which may be mentioned Winulski's monument to Jagello and Szymanowski's impressive 'Cortege of the Wawel.' One of the strangest products of the Viennese school is the young Dalmatian, Ivan Mestrovic, whose chosen work is the celebration of the prowess and suffering of his Serbian ancestry. His primitive art is weirdly impressive.

In Russian sculpture the name of greatest prominence is Marc Antokolsky (1845-1902). His powerful 'Ivan the Terrible' was followed by a series of dramatic works. Among his pupils was Ilia Ginsbourg. Lancéré is the best of many who have made small military and equestrian groups of great vigor. Leopold Bernstamm is better known in Paris than in Russia. Prince Paul Troubetskoy is famed for his impressionistic statuettes; but his method is less satisfactory in public monuments. Naoum Aronson (b. 1872) combines delicacy with forcefulness.

The artistic talent which exists everywhere in solution found but small encouragement during the first two centuries of American life; the slight achievements of Mrs. Patience Wright, modeler in wax; of William Rush of Philadelphia, carver of national figure heads, and of John Frazee in his portrait busts, are about all of which we have record. The history of American sculpture really begins with Horatio Greenough of Boston (1805-52), who in 1825

left Harvard College to study in Rome—the first of an endless procession who have sought inspiration and training abroad. Greenough's efforts naturally reflected the then dominant influence of Canova; his Zeus-like 'Washington,' intended for the rotunda of the National Capitol, was his most important work. Hiram Powers (1805-73) of Cincinnati, who followed in 1837, settled in Florence. His 'Greek Slave' had vast popularity at home and in England and is a landmark in American art history. Thomas Crawford (1813-57) crowded much enthusiastic work into a short life; his is the pediment of the Senate and the 'Freedom' upon the dome of the Capitol; also the Washington Monument at Richmond. It was Clark Mills, however (1815-83), who in 1853 created the first equestrian statue in America, the astonishing 'Andrew Jackson' of Washington, D. C. Other pioneers were Thomas Ball (1819-1911), who made the 'Lincoln Emancipating the Slave' in Washington and Boston, and the equestrian 'Washington' in the Boston Public Gardens; Henry Kirk Brown (1814-86), whose 'Washington' in Union square, New York, remains one of our finest equestrian statues; Randolph Rogers (1825-92), William Wetmore Story (1819-96) and Harriet Hosmer (1830-1908). Last, and perhaps most skilful of the American "classicists," was William H. Rinehart (1825-74) of Baltimore.

Erastus D. Palmer (1817-1904) of Albany and John Rogers (1829-1904) were of more distinctly native inspiration, the former creating works of no little ideal beauty, the latter celebrating patriotism and the homelier virtues in naïve, realistic statuettes. John Q. A. Ward (1830-1910) designed many virile monuments culminating in his noble statue of Henry Ward Beecher in Brooklyn. Other names of the early years are Launt Thompson (1833-94), Larkin J. Meade (1835-1910), Franklin Simmons (1839-1913), Martin Milmore (1844-83) and George Bissell (1839-), who have lived to see a marvelous development in American sculpture. Howard Roberts (1843-1900) of Philadelphia and Olin L. Warner (1844-96) were the first to seek training in Paris and thus turned the eyes of American students in a new direction.

It was Augustus Saint-Gaudens (1848-1907) who, after a thorough preparation in the École des Beaux-Arts, was called to the primacy among our sculptors. His 'Admiral Farragut' in Madison square, New York City (1881), set a new standard in American monumental art. It was followed by a series of distinguished works including the 'Lincoln' of Lincoln Park, Chicago; the Shaw memorial in Boston; the Adams memorial in Rock Creek Cemetery, Washington; 'The Puritan,' Springfield, Mass., and finally the equestrian 'Sherman' in New York City. These achievements, coupled with various ideal works and a host of remarkable portraits in low-relief, not only gave their author a commanding position among the foremost sculptors of the world but have greatly influenced the trend of American sculpture. No one has done so much to elevate the standard of craftsmanship in this country.

Daniel Chester French (b. 1850) has produced a great amount of admirable work. Best known is his well-beloved 'Death and the Sculptor.' This was followed by the colossal

4 Washington by French
6 Roch Jaquelin by Falguiere

'Republic' of the Columbian Exposition, the O'Reilly Memorial of Boston; 'Alma Mater' of Columbia University, the 'Continents' of the New York Custom House; the Melvin Memorial; the Alice Freeman Palmer Memorial; the Spencer Trask Memorial (Saratoga Springs, N. Y.), with its beautiful 'Spirit of Life'; the 'Lincoln' of Lincoln, Neb., and the same subject now under way for the great national Lincoln Memorial in Washington. Mr. French has also made a number of spirited equestrian statues—some of them in collaboration with Edward C. Potter (b. 1859),—as the 'Washington' in Paris and Chicago, 'General Grant' in Philadelphia and 'General Devens' in Boston. Saint-Gaudens' brilliant pupil, Frederick MacMonnies (b. 1863), lived in France for many years, modeling there his 'Stranahan,' 'Nathan Hale,' 'Shakespeare,' 'Bacchante,' 'Columbian Fountain,' 'Horsetamers,' groups for the Soldiers and Sailors' Memorial at Brooklyn and many other notable works. Equally well known abroad is Paul Bartlett (b. 1865), whose 'Columbus' and 'Michelangelo,' for the Congressional Library, are very distinguished conceptions. His equestrian 'Lafayette' stands in a court of the Louvre in Paris. More recent are the decorative figures for the Public Library of New York and the pediment of the House of Representatives in Washington.

George Grey Barnard has a personal expression of great originality and vigor, as demonstrated in his 'Two Natures,' 'The Great God Pan,' and two enormous groups for the State House of Pennsylvania. His 'Lincoln' for Cincinnati is particularly noteworthy and like Rodin's 'Balzac' has occasioned endless discussion. Another leader in American sculpture who like Saint-Gaudens was of foreign birth, was Karl Bitter (1867-1915). His was the training of Vienna and his progress from the turgid decorations of the Columbian Administration Building of 1893 to the restraint of his Carl Schurz and Lowry memorials (respectively in New York and Minneapolis) and the fine pediment of the Wisconsin Capitol, offers an inspiring example. Herbert Adams (b. 1858) has contributed much to the high esteem in which American sculpture is held. His 'Bryant,' in New York, and other statues are well known, but even more famed are his exquisite portraits of women. Hermon A. MacNeil (b. 1866) has won a high position through his Indian subjects—particularly 'The Sun Vow'—and various memorials, of which the Albany Soldiers and Sailors' Monument is perhaps the most important. Charles Niehaus (b. 1855) is widely known for his 'Garfield' of Cincinnati, 'Hahnemann' in Washington and other important works. James E. Fraser, a younger man (b. 1876), scored a great success with his equestrian 'The End of the Trail' at the Panama-Pacific Exposition of 1915. Even better known are the various equestrian Indians by Cyrus E. Dallin (b. 1861), which by virtue of their simplicity and sincere workmanship are a real national asset. John J. Boyle, 1851-1917 did admirably sturdy work on native lines, as in 'The Alarm in Chicago' and 'The Stone Age,' Philadelphia.

Andrew O'Connor (b. 1874) won an early triumph with his bronze doors of Saint Bar-

tholomew's Church in New York City, and has done much vivid sculpture, notably his impressionistic 'General Lawton' in Indianapolis, 'General Lew Wallace' in Washington and his recent 'Lincoln' for Springfield, Ill. Charles Gaffly (b. 1862) of Philadelphia is recognized as the master of portraiture in the western continent; his busts of men are unsurpassed. A. Stirling Calder has a style all his own and did great service in the decoration of the Panama-Pacific Exposition.

Albert Jaegers (b. 1878) in his Von Steuben Monument in Washington; A. A. Weinman (b. 1870) in his Baltimore military memorial and his 'General Macomb' in Detroit have made valuable contributions to the monumental art of America, as have William Couper (b. 1853), Augustus Lukeman (b. 1872) and several others. Nor is any chronicle complete without mention of the Piccirilli family of New York, all skilful craftsmen and, in case of two at least, Attilio and Furio, admirable artists. John Donoghue (1853-1903) is remembered for one beautiful work, his 'Young Sophocles' in the Art Institute of Chicago, and Edmond A. Stewardson (1860-92) for 'The Bather.' Another whose death was untimely was Bela L. Pratt (1867-1917), of Boston. Among the many gifted men of a younger generation who are practising with success the ancient art are Robert Aitkin, Sherry Fry, Chester Beach and Albin Polasek, all but the first being graduates of the American Academy in Rome; as are Paulanship, John Gregory and Leo Friedlander, who have been greatly influenced by the present archaistic tendencies of that institution.

Like Philadelphia, Baltimore has its little band of sculptors and Cincinnati and Saint Louis, each, at least one; Chicago has a large school and an exceptionally united group of craftsmen, while San Francisco shows numerous public works of Douglas Tilden and his pupils. Inspired by the traditions of Saint-Gaudens several American medalists have won distinction, among them Victor Brenner, John Flanagan, J. E. Fraser and A. A. Weinman. In the sculpture of animals Edward Kemeys (1843-1907) long stood alone, but to-day such skilful men as Edward C. Potter, A. Phimister Proctor, Solon H. Borglum and Edward Roth have won high places.

The women sculptors of America who have been honored by membership in the National Sculpture Society are Mrs. Gail Sherman Corbett, Misses A. St. L. Eberle, Harriet W. Frishmuth, Laura Gardin, Frances Grimes, Anna V. Hyatt, Evelyn B. Longman, Mrs. H. H. Kilson, Mrs. Carol B. MacNeil, Miss Janet Scudder, Mrs. Bessie Potter Vonnoh, Miss Nellie V. Walker and Miss Enid Yandell.

LORADO TAFT,

Author of 'The History of American Sculpture.'

SCULPTURE SOCIETY, National, a society founded 30 May 1893, and incorporated 1896. Up to the earlier of these dates sculpture had received somewhat grudgingly a place in the picture exhibitions and this fact led the sculptors to band together for a separate organization. In 1895 an exhibition for sculpture alone was held in New York, the objects shown having the advantage of a background of architecture, trees, shrubbery and flowers and pe-

riodical exhibits have since been held. One reason for the existence of the National Sculpture Society was to provide a centre of authority regarding public and private monuments, and its influence has been beneficially exerted on the decorations and the decorative sculptures of many important public buildings and festival undertakings. The headquarters of the society are at 212 West 57th street, New York City.

SCUP, one of the names of an important American food-fish (*Stenotomus chrysops*) belonging to the family *Sparidae*, to which the sheepshead and snapper also belong. Besides some technical characters of the skeleton and swim-bladder the scup may be known among fishes inhabiting the same region by its deep compressed body, prominent dorsal spines, of which the third is elongated and the canine-like incisor teeth. The color is silvery gray with purplish reflections above, pure silvery on the sides below. This fish is abundant from Cape Cod to the Carolinas and reaches a large size on rocky ledges where food is abundant, though ordinarily not exceeding 9 or 10 inches in length; it reaches a remarkable size at the age of two years. In the South it is known popularly as porgy. Consult Goode, G. B., 'American Fishes,' (New York 1888); Jordan and Evermann, 'American Food and Game Fishes,' (New York 1902).

SCURVY, a disease resembling purpura, characterized by inanition, anemia, asthenia, ecchymoses and a tendency to swelling and bleeding of the gums. It is mainly due to disordered nutrition from improper food. Sometimes it follows a deficiency of fresh vegetables and fruits, or an excess of salt fish and pork, the use of tainted food, a too monotonous diet, or an insufficient amount of food. General ill health and malnutrition, and a cold, damp winter, compelling persons to house themselves, are predisposing causes. No condition of the blood differing from that found in other anemias has been recognized. Some believe that the disease is an infection because it has often spread rapidly in prisons, workhouses, etc., and sometimes has a distinct period of incubation, and because one attack, as a rule, confers immunity. It is not related to relapsing fever, which is contagious.

Up to the middle of the last century scurvy was frequent during wars, pestilences and famine, and especially on long sea-voyages when the diet consisted largely of bread, tea and salt meat. During the Crimean War 23,000 cases of scurvy occurred among the French troops alone, and in the American Civil War 15 per cent of the deaths were from this disease, though many cases recovered, owing to the use of vegetable food furnished by the Sanitary Commission. At the present time scurvy is comparatively rare, as most vessels going on long voyages are supplied with a variety of anti-scorbutics, canned meats, lime-juice, lemons, and other fruits, vegetables, etc., and on land, in civilized countries, or at least where hygiene is not rudimentary, fresh fruits and vegetables are more used than formerly.

In scurvy the blood coagulates poorly, its red corpuscles are diminished, while the white are increased in number. Sometimes there is œdema of the feet and ankles and serous exudation into the pleural and large joint cavities.

There are purpuric spots in the skin, especially on the legs, ecchymoses in the pleura, pericardium, cerebro-spinal meninges, synovial membranes and in the mucous lining of the bronchi and alimentary canal; and hæmatoma in muscles like the gastrocnemius and glutæus, which may suppurate or in part organize. The gums are swollen, especially about the teeth, and their deeper layers are thickened; fatty changes occur in the liver, spleen, kidneys and heart; the bones may be carious or fractured; and the bone-marrow and mesenteric glands may display hemorrhagic infiltration. In infants the ecchymoses are almost entirely subperiosteal, the blood raising the periosteum (usually of femur, sometimes of tibia or fibula, rarely of the bones of forearms or other parts) in a fusiform swelling, surrounding the bone. The bones become thickened and sometimes superficially necrosed. The epiphyses may separate. The gums may be spongy.

The symptoms of scurvy, which usually develop slowly, include lassitude, anemia, flaccidity of muscles, a cool, dry skin, with sometimes a yellowish pallor. When the disease is developed the gums are red, nodular or fungous, and bleed readily. When the disease is advanced, hemorrhage occurs internally or externally, the breath is offensive, the gums ulcerate, and the teeth loosen. There is thirst, with a craving for sour food and condiments; the joints are swollen and painful; syncope, dyspnoea, and pulmonary congestion are common; the urine is scanty, high-colored, and less than normally acid; the temperature is subnormal (96° F. or 97° F.). The patient is pale, feeble, much emaciated, mentally depressed, and may have low delirium and coma. Meningeal hemorrhage may cause convulsions or hemiplegia. In infants, over the inflamed periosteum there is intense pain and tenderness, swelling and a tense, shiny skin. The child screams when moved, loses appetite, emaciates, grows pale and feeble, perspires freely. There is usually diarrhœa, sometimes hematuria, hemorrhagic blebs in the pharynx, and extravasation of blood in the orbit. Other extravasations, however, are rare. The present day attitude is to regard scurvy as a disease due to the deficiency of certain ingredients in the diet. These are usually chemical or nitrogenous phosphorus compounds, often called vitamins.

SCUTAGE, or **ESCUAGE**, in the feudal system the fee on payment of which the military service due from the holder of a knight's fee was not exacted. It originated about the 11th century, and the irritation caused by its exaction was one of the causes that moved the barons to oppose King John in 1214. Consult Baldwin, J. F., 'The Scutage and Knight Service in England' (Chicago 1897).

SCUTARI, Anatolia, city on the east shore of the Bosphorus, opposite Constantinople. It is a busy trading centre of ancient date, and now an important railway junction, with manufactures of silk and cotton textiles, leather, etc. Historic Chalcedon as the modern village of Kadiköi is two miles distant to the south. Scutari was prominent during the Crimean War 1854-56, as the scene of the ministrations of Florence Nightingale and her co-workers, and was also the centre of great activity during the European War. Pop. about 100,000.

SCUTARI, skoo'ta-rē, Albania, (1) capital of the province of Scutari, at the confluence of the Drin and Boyana, lies near the Lake of Scutari. The town is fortified, the citadel crowning an eminence. There are besides, two castles, mosques, Greek and Catholic churches, ship-building yards and factories for cotton and firearms. There is an active trade. The exports include wool, wax, hides, skins, tobacco and dried fish, sent to Trieste, Venice and Avona. The imports are colonial produce, silk and other manufactured goods which are sold at the large fairs. The fisheries are important. Pop. 32,000.

(2) The province or sanjak of Scutari contains 4,516 square miles and has a population of 322,000.

(3) The Lake of Scutari is 18 miles long by 6 miles wide; on the northwest it receives the Moratcha. The Boyana forms its outlet into the Gulf of Drino in the Adriatic Sea.

SCYLLA, sil'a, a character in mythology, the daughter of Nisus, king of Megara, who, when Minos came from Crete to attack Megara, in revenge for the death of his son, Androgeos, was led by her love for Minos to cut off from the head of her father, King Nisus, a purple lock of hair which while it remained on the head of Nisus made it impossible for Minos to take the city. Megara was captured and Nisus slain, and Scylla was either drowned or changed into a fish which Nisus, changed into an eagle, constantly pursued.

Also another Scylla, mentioned in the Odyssey, as a monster with 12 feet, six necks and six mouths, and occupying a rock on the Italian coast. Legends represent her as having been a beautiful woman changed into a monster through the jealousy of Circe or Amphitrite.

SCYLLA and **CHARYBDIS**, ka-rīb'dīs, the former a promontory of southern Italy, at the entrance of the strait which divides Italy from Sicily. Navigation around this promontory was considered dangerous by the ancients, but is regarded by moderns as not attended by special difficulty. Charybdis is a whirlpool nearly opposite the entrance to the harbor of Messina in Sicily, the navigation of which is regarded as very dangerous even to vessels of the present age and which must have been extremely perilous in ancient times. "Between Scylla and Charybdis," means to be confined to a choice between two dangerous situations.

According to the Odyssey (xii, 73ff.) these were two sea monsters, personifying the dangers of rocks and eddies. A description of Scylla is given under that heading. Charybdis sat opposite her, on a low rock under a fig tree, sucking in and belching forth, thrice daily, the adjacent water. In the 'Alexandreis' of Gautier de Lille occurs the famous line, "Incidis in Scyllam cupiens vitare Charydim."

SCYTHIANS, the writers of the Classic Age confounded under this name several peoples, who dwelt from the present Rumania to the Pamir across middle Russia and the Caspian steppes. However, the authors who have best described these peoples distinguish the Scythians proper or *Scolotes*, as they called themselves, the immediate neighbors on the north of the ancient Greeks, from the Sarmates who lived to the east of these, and from

the Saks who dwelt further east in the land now known as Turkestan.

The Scythians proper occupied from the time of Herodotus the region between Atlas (the present Aluta, tributary of the Danube) on the west and the Tanais (the Don or perhaps the Molotchnaia) flowing into the Sea of Azov on the east. To the south their frontier was marked by the lower course of the Danube from the mouth of the Aluta, and by the Black Sea. To the north their territory extended to the country of the Agathyrce (Transylvania?), to the Neuri in the upper basin of the Dneister and the Bug, and to the Androphages. Altogether they occupy the eastern part of Wallachia, almost all Moldavia, Bessarabia, the present Russian provinces of Kherson and southern Podolia, and the Crimea, except the mountainous southern portion of the latter, which remained in possession of the savage Tauri. Herodotus divides the Scythians into (1) cultivators, dwelling in the valleys of the Dneister and the Bug, adjoining the Neuri and in the lower valley of the Dneiper and the Panticapée (probably the present Ingouletz); (2) the nomads of the eastern Crimea and south of the mouth of the Dneiper; (3) the Royal Scythians in the eastern Crimea and between the Dneiper and the Tanais; (4) the Kallipydes between the Bug and the mouths of the Danube. The Scythians are mentioned for the first time in Hesiod, and many ethnologists are of opinion that their arrival in Europe was about the 15th century B.C. The principal trait of nomadic life—sustenance from ass's milk—is recorded in every ancient description of this people, who were for the most part, nomads and warriors. Hippocrates gives a detailed description of their mode of life—in four-wheeled chariots, impervious to rain, wind and snow, and often divided into two or three compartments. These chariots were drawn by hornless cattle, the women and children remaining within them while the men accompanied them on horseback. They remained in the same place while there was forage sufficient for their animals, failing which they moved onward. They lived on cooked meats, ass's milk and cheese.

Excellent horsemen, the Scythians hunted and fought on horseback; they were famed as bowmen, but were poor swordsmen. Enemies slain in battle were scalped and their blood drunk from the skulls of others previously slain.

Their religion was a kind of polytheism without external worship. They had no temples nor images of deities to which prayers and sacrifices were offered. The god of war alone had special places reserved for his especial adoration. To him animals and even human beings were offered in sacrifice. Fire worship was general. Women enjoyed a certain amount of consideration due, it is thought, to the legend that the people were descended from a female-warrior race, the Amazons.

The mode of life of the nomadic Scythians led many to a belief in their Mongolian origin. This opinion is, however, no longer held. The little we know of their language, customs and religion leads rather to the conclusion that they were Iranians. About the second century B.C. the Scythians were conquered by the Sarmates and absorbed by them. Thereafter they dis-

appear from history. Consult Deniker, 'Races of Man'; Ratzel, 'History of Mankind' (3 vols., London 1900).

SEA. See OCEANS.

SEA-ACORN, or ACORN-BARNACLE, a barnacle of the family *Balanidae*. See BARNACLE.

SEA-ANEMONE, a popular name, having reference to their flower-like aspect, for certain polyps or coelenterate animals belonging to the suborder *Actinaria* of the order or class *Anthozoa*. The sea-anemones are sac-like animals of a more or less cylindrical form, usually fixed by a base or foot to some firm body, and with a disc at the opposite end in which is the slit-like mouth surrounded by whorls of simple hollow tentacles in greater or less number, but nearly always some multiple of six. From the mouth a short tubular gullet or oesophagus reaches into the cavity of the body to the walls of which it is connected by radiating septa or mesenteries, which divide the body-cavity into a corresponding number of sacs, with all of which the oesophagus communicates by a central space into which the septa do not reach. A pair of ciliated grooves or siphonoglyphs extend along opposite sides of the oesophagus and into the corresponding corners of the mouth. These always remain open and are the seat of inflowing and outflowing currents of water, serving a respiratory function as well as for the transportation of waste matter from the body. The body-walls, as well as the tentacles, which are outgrowths from them, are very contractile and largely composed of muscles arranged in a circular and a longitudinal layer, the former serving for purposes of extension, the latter for retraction. These muscles have special relations to the mesenteries. The mesenteries are vertical radiating septa reaching from the mouth disc or peristome to the base, and from the body wall to the oesophagus, but below the level of the latter ending freely. They are not strictly radial in arrangement but are grouped in pairs almost always, like the tentacles, in some multiple of six. The mesenteries corresponding to the siphonoglyphs differ in structure from all of the others and are termed directive; the others form different classes according to the order and degree of development. The inter-mesenteric sacs may further communicate by one or two pores in each mesentery. Along the edges of the septa the testes and ovaries are developed from the cells lining the gastric cavity. Digestive cells are also found in the same region as well as an area filled with stinging thread cells or nematocysts. In some species the latter are found in addition upon delicate threads or acontia which may be protruded through the mouth or cinclides.

Most of the anemones live singly, but some are colonial, in which case they never, like the closely related stone corals, form an internal limy skeleton, but may form a superficial one in the ectoderm. Generally they live attached to rocks or piles, but a few burrow in mud or sand, some as commensals fix themselves to shells inhabited by hermit crabs, etc., and a few are truly parasitic in jellyfishes. All are marine; most sublittoral, some deep-sea and a very few pelagic. They reproduce both asexually by budding and fission and sexually by eggs

and spermatozoa, which are usually produced by different individuals. The eggs are fertilized in the gastric cavity and escape from the mouth in most cases as minute free-swimming larvæ or planulæ which soon attach themselves, develop mouth, tentacles and mesenteries, the latter in a definite order, until the adult structure is attained. Sea-anemones are carnivorous, but, having very limited powers of locomotion, are dependent upon such food as falls upon the expanded tentacles and peristome. This is captured through the paralyzing effect of the stinging cells or engulfed by the enfolding tentacles and passed through the mouth into the gastric cavity for digestion, the undigested portion being rejected through the mouth. They will devour a surprising quantity of food and grow rapidly; and if starved, gradually shrink to almost the point of disappearance without losing their form. The species are quite numerous and are chiefly distinguished by the arrangement of the septa and tentacles, with color, form, etc., as minor characteristics. Most of them and particularly the tropical forms are beautifully colored. A large, handsome and variable species very common on the rocky shores of New England is *Metridium marginatum*, which makes an interesting inmate of the marine aquarium. Consult Agassiz, E. C., and A., 'Seaside Studies in Natural History' (Boston 1871); Arnold, A. F., 'The Sea Beach at Ebb Tide' (New York 1900); Mayer, A. G., 'Sea-Shore Life' (ib. 1905); Lankester, 'Treatise on Zoology,' Pt. II (London 1901); for American species, Parker, 'American Naturalist' (1900).

SEA-BASS, a fish (*Centropristis striatus*) of the family *Serranidae* (q.v.), also known as the black-fish, etc. It commonly attains the length of about a foot and a weight of two to four pounds, and is readily known by the large mouth with the teeth of moderate and nearly uniform size, the smooth area on top of the head, the rather large very rough stenoid scales, continuous dorsal fin with a very strong spine and the slightly trilobate tail with a short filamentous tip to the upper angle. The color is mottled blackish with more or less evident parallel pale streaks. The sea-bass is well known along the entire Atlantic Coast of the United States and is very common from Cape Cod to the mouth of Chesapeake Bay. It lives on rocky ledges wherever an abundance of food offers itself, and feeds voraciously upon all sorts of small crustaceans, fishes, squids and other mollusks, etc. The sea-bass is a sluggish bottom-loving fish, but appears to be somewhat migratory. It spawns in June and the eggs are of small size and buoyant. During the summer large numbers of the young collect in the shallow bays, where eel-grass grows in abundance. Owing to its abundance and the readiness and determination with which it takes the hook this is deservedly a favorite with anglers who lack the opportunity or skill to cope with nobler game. The fishing is done with hand-lines in from 5 to 20 fathoms of water, a heavy lead and a stout hook, preferably baited with squid, being required. Where they are plentiful two fish are frequently brought up simultaneously on as many hooks and large strings are taken during a single slack water, which is the time best suited to their capture. For the market large

numbers of sea-bass are taken by lines and in pound nets on the coasts of New Jersey and Massachusetts. The firmness, whiteness and sweetness of its flesh makes this a table favorite, especially for chowder. The sea-bass is readily propagated artificially, but there has been no necessity for entering upon this work on a large scale. The name is also sometimes applied to various other more or less closely related species.

SEA-BEANS, very hard-shelled seeds of tropical plants carried by ocean currents and deposited on beaches, where they take root. Those washed up on the Florida sands take a high polish and are made into jewelry and souvenirs. The polished, marble-like, pale-gray seeds are those of a tall Central American shrub (*Casalpinia bonducella*), known in their native country as the nicker or bondue nuts. They are employed for necklaces and by Indian doctors as a tonic and vermifuge. Other common sea-beans are flattened, like lima beans, with a pitted or granular surface, and are of various sizes and hues, ranging through shades of red and brown to black or mottled. These are the fruits of species of *Mucuna* and *Stizolohium*, the former climbing shrubs, the latter annual herbs, widely dispersed through the tropics and very annoying to travelers, as the seed-pods are covered with stinging hairs, easily detached. The Queensland nut, the Kindal-Kindal of Australia, is a nutritious nut, the fruit of a small Australian tree (*Macadamia ternifolia*) and so valuable as a food that no one is allowed to fell the trees. The seed is about the size of a hazelnut, with somewhat the same flavor. It is squarish, jet black, with a polished surface of iron-like hardness. A woody climber (*Entada scandens*), native to Australia, the West Indies and other tropical countries bears pods two to four feet long and several inches wide. Its seeds, known as liner-beans, from their color, are used for washing the hair and for laundering and the shells are made into receptacles for trinkets.

SEA-BEAR. See SEAL.

SEA-BLITE. See GOOSEFOOT.

SEA BOUNDARIES. See BOUNDARIES OF THE UNITED STATES.

SEA-BREAMS, fishes of the marine family *Sparidae*, represented in the United States by the sheepshead and its congeners. They are coast-fishes of modern size, distributed throughout the warm and temperate parts of the world and are usually of dark coloration. They are distinguished by the strength and elaboration of their teeth, fitting them for seizing and chewing crustaceans, mussels and shellfish of all sorts. The fish most famous under this name is probably that of the Mediterranean *Chrysophrys aurata*, called gilthead in England, which sometimes reaches a weight of 20 pounds, and was one of the kinds fattened by the Romans of the classic age in fish ponds and regarded as especial delicacies.

SEA BUCKTHORN, or **SALLOW-THORN**, a monotypic genus (*Hippophaë*) of the *Elæagnaceæ*, confined to temperate Europe and the steppes of central Asia, and living near sea-coasts and alpine rivers. The single species, *H. rhamnoides*, is a thorny shrub, sometimes cultivated, especially for hedges near the sea in

sandy soil, where it grows luxuriantly. The leaves are linear lanceolate, silvery in color; the inconspicuous dioecious flowers on the female plants are followed by succulent orange-colored, agreeably acid fruits. When the fruit is ripe in the fall the female plants are very beautiful because the berries are very abundant. These are used for making fish-sauces, jellies and condiments.

SEA-COCOANUT. See PALMS.

SEA-COOT, a gunners' name for certain dark-colored ducks, especially the American scoter.

SEA-COW, a name often applied generally to sirenians (see SIRENIA; MANATEE), but especially restricted to the species formerly inhabiting the Pacific Coast of Kamchatka,—Steller's sea-cow (*Rhytina stelleri*), now extinct. Structurally it differs from other sirenians in the total absence of teeth, the masticating surfaces of the jaws being merely horny pads, very dense and hard. The tail was lobed and the fore limbs small truncate paddles. This was a very large animal, attaining a length of 25 feet and being very bulky. It is now entirely extinct and was under the observation of white men for a bare quarter of a century. In 1741 the explorer Bering and the naturalist Steller discovered this great animal about the shores of two small islands, now known as Bering and Copper islands, in the extreme north Pacific Ocean. It is not known to have lived elsewhere and there is no proof that any examples have been seen since that killed in 1768. Steller has preserved an account of their habits and anatomy during the period when he was a shipwrecked resident of that inhospitable region. The animals were at that time very abundant in the shallow waters about the islands, where they fed upon the large seaweeds which grow there so plentifully. They were extremely sluggish and inactive and of an unsuspecting, affectionate disposition. Upon Steller's return to Germany his discovery and suggestion that the flesh of these great sea-cows be utilized by explorers were published. Russian traders and trappers visited the islands in large numbers and in the short space of time noted exterminated this interesting animal. Consult Nordenskiöld, N. A. E., 'Voyage of the Vega' (English trans. by Alexander Leslie, 2 vols., New York 1881), and Stejneger, L. H., in the *American Naturalist* (Vol. XXI, Salem, Mass., 1887).

SEA-CUCUMBER, a holothuria (q.v.).

SEA-DEVIL, a devil-fish (q.v.).

SEA-DOVE, the little auk. See DOVEKIE.

SEA-EAGLE, an eagle of the genus *Haliaëtus*, especially the white-tailed eagle or Erne (*H. albicilla*) of Europe. See EAGLE.

SEA-EGG. See EGG-URCHIN; SEA-URCHIN.

SEA-ELEPHANT. See ELEPHANT-SEAL.

SEA-FAN. See GORGONIA.

SEA-FIR, a sertularian. See CŒLENTERATA.

SEA-FOX, a shark. See THRESHER.

SEA-GULL, *The* (Chalka), a tragedy of Chekhov, first performed in Saint Petersburg in 1896, when the author was 31. It failed, but later met with brilliant success at the Moscow Theatre, and has perhaps been the most popu-

lar of Russian plays on the English stage. It was translated into English by Marian Fell (Mrs. Van Agnew) and published in New York in 1912. A hint at the plot may be given by a sort of algebraic formula: A, a famous actress, is the mistress of B, a famous novelist, who comes with A to visit her brother C, a typical landowner and invalid. A's son, D, who has ambitions as a playwright is in love with E, the beautiful daughter of a wealthy landowner. E, being unhappy at home, has a great desire to go on the stage, and easily falls a victim to B, who seduces her and deserts her, after their child is born. E comes back secretly after two years and has a passionate interview with D, confessing that she still loves B. She disappears, and D shoots himself. On C's estate is a beautiful lake which is the haunt of gulls. D kills one of them and has it stuffed. This "chalka" is typical of the heroine, E. B to E once said: "A young girl grows up on the shores of a lake, as you have. She loves the lake as the gulls do, and is as happy and free as they. But a man sees her who chances to come that way, and he destroys her out of idleness, as this gull here has been destroyed."

There are passages of wit and humor in the play, but it is chiefly notable for its revelation of the darker strains of human nature, depicted with relentless realism and yet with a passionate sympathy with all suffering, physical, mental and moral. It is also interesting here and there, especially in contrasting the literary methods and aspirations of B and D, giving a hint at Chekhov's own literary creed. And E, the lovely young heroine, shows her whole attitude, in advance of the tragedy which, while it ruins D, only gives the cachet to her own ability as an actress, when she exclaims to her seducer: "For the joy of being an author or an actress I could endure want and disillusionment and the hatred of my friends and the pangs of my own dissatisfaction with myself; but in return I should demand fame—genuine, resounding fame."

NATHAN HASKELL DOLE.

SEA-HARES, a genus (*Aplysia*), of opistho-branchiate gastropod mollusks, in which the shell is either absent or very rudimentary, and is concealed by the mantle. These animals are slug-like in appearance and derive their popular name from the prominent character of the front pair of tentacles which somewhat resemble the ears of a hare. The side lobes of the mantle are used as fins, and are reflected over the sides and back of the sea-hares, these portions of the mantle thus concealing the shell. This latter structure, when developed, is of oblong, flexible and transparent character. The gills are placed in the centre, and at the posterior portion of the dorsal surface or back; and four tentacles exist. Eyes are present, and are situated at the base of the hinder tentacles.

The sea-hares are widely distributed throughout most seas, and generally inhabit muddy or sandy tracts. The eggs are deposited in long strings. The food consists chiefly of sea-weeds, but they also devour small crustaceans, mollusks and annelids. The mouth possesses thick muscular lips, and the stomach is of compound nature, consisting of a crop, muscular gizzard and accessory cavities. The sea-hares were no-

torious among the ancients for their supposed venomous properties, and formed ingredients in the poisonous compounds used of old to destroy enemies. Locusta is thus said to have used them against the enemies of Nero; and they formed ingredients in the draught prepared for the tyrant himself. Domitian was similarly suspected of administering the poisonous *Aplysiadæ* to his brother, Titus. And when Apuleius was accused of practising magic a chief proof against him was the fact that he had employed fishermen to obtain sea-hares for him. These animals, however, are harmless so far as poisonous properties are concerned, except that some species exude an acrid liquor irritating to the human skin. The "lerna" (*Aplysia leporina*) of the Bay of Naples has an evil reputation among fishermen for causing pain and sickness when touched. The sea-hares also emit a fluid of a rich purple hue, which, like the ink of the cuttle-fishes, has the property of diffusing itself quickly throughout the surrounding water. Gosse mentions that a West Indian species of *Aplysia*, on being put into a basin of clear sea-water, emitted sufficient of this purple secretion to tinge deeply the whole of the water within a few minutes. Consult 'Cambridge Natural History' (Vol. III, New York 1895); Lankester, 'Treatise on Zoology' (Vol. V, London 1906); Parker and Haswell, 'Text-book of Zoology' (Vol. I, New York 1910).

SEA-HORSE, a small fish of the genus *Hippocampus*, in which the head bears a close resemblance to that of the knight in chess. They belong to the order *Lophobranchii* and the same family (*Syngnathidæ*) as the pipe-fishes. From the latter, and indeed from all other fishes, they differ in having a prehensile tail, which is long, tapering and quadrate in section, owing to the integument of angulated, bony plates, and lacks altogether the caudal fin. The body is compressed, curiously prominent below, protected by rings of spinous bony plates, and bears small pectoral, dorsal and anal fins. In addition to its form the head is remarkable in being supported at right angles to the body-axis on a neck-like construction. Like other parts it is protected by tuberculated or spiny bony plates. A prolonged snout bears the small toothless mouth at its end. The gills are tufted and their arches and covers poorly developed. About half a dozen closely similar species are found in our waters, the best known of which is *H. hudsonicus* found in shallow bays and estuaries along the Atlantic Coast as far north as Cape Cod. There is no more interesting inmate of the marine aquarium than the sea-horse, which twists its tail about the stems of sea-plants, among which it seeks concealment or swims slowly in a very unfishlike attitude, with coiled tail, upright in the water. As in the pipe-fishes the eggs are protected until hatched in a brood-pouch at the base of the tail of the male. Other species occur in the warm waters of the Gulf of Mexico and California. A remarkable related genus is *Phylloperyx* of Australian seas, which bears numerous long cutaneous streamers closely mimicking the seaweeds among which the animal dwells.

In symbolic and heraldic art a "sea-horse" appears as a fabulous marine animal with foreparts like those of a horse, and with hinder

parts like a fish. Neptune is depicted as using them to draw his chariot. In the sea-horse of heraldry a scalloped fin runs down the back. In Biblical literature and early books generally the term often refers uncertainly to the walrus or to the hippopotamus. Consult Gunther, Albert, 'Introduction to the Study of Fishes' (London 1880), and Jordan, D. S., 'Fishes' (New York 1907).

SEA ISLAND COTTON. See COTTON IN THE UNITED STATES.

SEA ISLANDS, the islands off the coast of South Carolina, south of Winyah Bay. They are a chain of low, flat islands noted for their fertility. The principal islands are Hilton Head, Port Royal, Saint Helena, Edisto, Johns and James. The quality of the long fibred "Sea Island cotton" is famous, and the rice product is large. In 1893 and in 1894 hurricanes devastated several of the islands, inundating them with the tidal waves and destroying the crops.

SEA-KALE, a cruciferous, large-leaved perennial (*Crambe maritima*) indigenous to the coasts of Europe. It has glaucous cabbage-like foliage and clusters of showy white flowers and is cultivated in rich soil for the young shoots and unfolded leaves, which are blanched and eaten as spring vegetables, like asparagus.

SEA-LAMPREY. See LAMPREY.

SEA LAVENDER, SEA PINK, THRIFT, a name common to various species of *Statice* (q.v.), and to the closely allied species of *Limonium*. Several of the former, being hardy, are popularly cultivated as border plants. They include annuals, biennials and perennials with abundant small blue, lilac, yellow or white flowers which are often used for "everlasting" bouquets. Species of *Limonium* are mostly perennial, are useful for cut flowers and for planting among rocks.

SEA-LEMON, a shell-less mollusk of the nudibranch family *Doridæ*, of cosmopolitan range. The body somewhat resembles a lemon in color, showing a beautiful plume-like tuft of gills (when expanded) on the back. These mollusks are carnivorous, feeding on zoophytes, crustacea, etc., and live under stones on the beach, usually near low-water mark. The eggs are emitted embedded in broad gelatinous ribbon-like masses, which may be found attached to the fronds of sea-weeds. These "spawn-coils," as they are named, include immense numbers of eggs. Darwin estimated that upward of 600,000 ova were contained in a coil found at the Falkland Islands.

SEA-LETTUCE, the delicate, thin, waving fronds of *Ulva lactuca*, a pale green seaweed often used for food.

SEA-LILY, a crinoid (q.v.), especially a living example, as *Pentacrinus*; fossil crinoids are often called stone-lilies.

SEA-LION. See SEALS.

SEA-MAT, or **HORN-WRACK**, a colony of polyzoans (see POLYZOA); specifically, on British shores. Some species of *Flustra*, as the broad horn-wrath (*F. foliacea*).

SEA-MINK, one of the names of the kingfish (*Menticrhus americanus*). See KINGFISH.

SEA-MOUSE, a free-moving marine annelid of the genus *Aphrodite*, the most highly

organized of "the world of worms." The body is oval, the head is provided with tentacles and two eyes and the back is covered with scales, which, by their expansion and contraction, provide for the admission and expulsion of water from the gills or branchiæ, situated beneath them. The most notable feature of these animals, however, is the beautiful iridescent hues exhibited by the hairs, which, as in other *Errantia*, fringe the sides of the body. The setæ of *Aphrodite*, even preserved in spirits of wine, still give up these brilliant hues. These animals inhabit deep water and may be obtained by dredging, although they are frequently cast up on shores after storms. Various genera and species exist, some of which are North American. Consult Verill, 'Zoology of Vineyard Sound' (1875).

SEA-ONION, a squills. See SCILLA.

SEA-OTTER, a fur-bearing animal (*Enhydris* or *Lutra lutris*) of the weasel family (*Mustelidæ*), and in its webbed hind feet and aquatic habits resembling the true otter, with which it is united zoologically in the subfamily *Lutrina*. The sea-otter is of a robust build, about four feet long, with a short blunt tail, short limbs, small fore feet and large, fully-webbed hind feet. The ears are small and the broad muzzle bears spreading tufts of stout bristles. There are but two incisor teeth on each side of the lower jaw and the molar and premolar teeth are remarkable for their massiveness and the bluntness of the cusps. The inner fur, which is very soft, dense and woolly, is deep brown or, in old animals, black, the longer white-tipped hairs being scanty on the body, to which they impart a hoary aspect, but more abundant on the yellowish or grayish head and neck. Sea-otters were formerly very abundant on rocky shores and islands of the north Pacific on both the American and Asiatic sides. The natives of the Aleutian Islands clothed themselves in their skins, but with the increased demand for the fur in China, Europe and America, and especially among the Russian nobility, their unremitting pursuit by native and white hunters has rendered them one of the rarest and most valued of fur-bearing animals. In greatly reduced numbers they are still found in Alaska and within the United States on a very limited reach of the Oregon coast. The otters are now found especially on the island-like masses of the giant bladder kelp or seaweed and much persecution has made them exceedingly shy and wary. They are strictly marine and never leave the vicinity of water. Their food consists of various kinds of crustacea, mollusks and sea-urchins, which are easily crushed between the blunt massive teeth which are not at all adapted to a fish diet. A single young is born at a time and at any season, and is nursed by the mother as she lies on her back in the water. A century ago a single trading company secured as many as 15,000 skins, valued at \$1,000,000, in one year, but now the annual production of all the hunters would not exceed 5,000, and single skins are worth \$150 to the hunter and \$1,000 or more at the final market. Formerly they were taken in nets, or shot, speared and clubbed; but now are usually shot with rifles either by the natives from boats or while patrolling the beach, or from observation tripods erected by white hunters

on the shores. The Alaskan fishery is now regulated by law. Consult Elliot, H. W., 'Report on Alaska' (Washington 1875); Coues, E., 'Fur-bearing Animals' (Washington 1877); Taylor, W. P., 'Osteology and Evolution of the Sea-Otter' (in 'University of California Publications,' Vol. VII, No. 25, Berkeley 1914).

SEA-PEN, an alcyonarian coral of the family *Pennatulidæ* (class *Actinozoa*). It is a compound organism, which consists of a main stem with lateral pinnæ or branches, forming a feather-shaped community. The lower end of the stem is fleshy, destitute of polyps and contains an internal coral-rod, by which the sea-pens attach themselves loosely to the mud of the sea-bed. In color they are reddish-purple, the lower extremity being of a bright orange hue. The branches are studded on their upper margins with the individual polyp, which are connected together through the fleshy medium or *cœnosarc*. These organisms are common in all the warm seas. The Arctic species, *Umbellularia grænlandica*, attains sometimes the extreme length of four feet.

SEA-RAVEN, a large and very spiny and irregular sculpin (*Hemitripterus americanus*), common about rocky shores and reefs from the Arctic coasts to Cape Cod. See SCULPIN; SEA-ROBIN.

SEA-ROBIN, a popular name for certain of the gurnards (*Triglidae*) in allusion to their generally reddish color and large wing-like pectoral fins. They have rather large heads, encased in bony plates and with flattened snouts and elongated tapering bodies covered with small scales. The pectoral fins are very large and spreading and are especially remarkable in having the three lowermost rays separated from the fin-web and free from one another; they are somewhat enlarged, provided at the end with special organs of touch and are used much like so many fingers to feel the bottom, turn over stones and other small objects and to detect the presence of food. Numerous species of the genus *Prionotus* inhabit American seas, especially southward, the best known of which are the short-winged sea-robin (*P. carolinensis*), with the pectoral fins red and less than half as long as the body and the long-winged sea-robin (*P. strigatus*) with the pectorals brown and more than half as long as the body. Both are common as far north as Cape Cod and the former in Massachusetts Bay also. The sea-robins are extremely interesting to watch, as they turn over small objects on the bottom with their tactile rays in search of the small fishes and crustaceans upon which they feed. Large numbers are caught upon lines and in nets, but though the flesh is white and very excellent, they are not considered to be a food-fish. Several related species are found on the Pacific Coast, and elsewhere, and some are called flying-fish. See SCULPIN.

SEA-SERPENT, a more or less mythical sea-monster of serpentine form and reputed gigantic size, whose appearance has been reported at varying intervals and in many seas from the earliest times. The existence of a definite species of serpent of this sort is firmly believed in by most sea-faring men, many of whom have observed conformatory appearances. In a large number of instances these have been quite satisfactorily explained as tide-

rows of sea-weed, etc., moved in an undulating fashion by wave action; as schools of porpoises moving in a single file, as giant squids swimming at the surface with their serpentine arms trailing behind, or in a variety of similar ways. There remain, however, a number of accounts whose circumstantiality and general agreement, together with the trustworthiness of the narrators, are such that many zoologists are convinced of the existence of such a monster and few are willing to deny it, although, in the absence of direct proof, a scientific skepticism prevails. That large fishes of serpentine form live in the open ocean is well known and these may prove to be the foundation of many of the sea-serpent stories. Among these are the ribbon-fishes (*Regaleidæ*) of which a number of species have been described. They have elongated, compressed, tapering bodies with oblong heads and toothless jaws and a continuous dorsal fin for the entire length, rising on the head into a prominent crest. Specimens of these fishes exceeding 20 feet in length have been actually washed ashore and examined by naturalists, and others of much larger size have been observed swimming swiftly at the surface, presenting a veritable sea-serpent aspect. One has been taken in the Bermudas, another on the coast of California and perhaps a score on other shores, while many more have been seen alive. The ribbon-fish is supposed to live in the depths of the sea and to come to the surface only occasionally. A slender eel-like shark (*Clamydose-lache*) also lives in the deep waters of the Pacific, and if it attains a large size might justify reports of sea-serpents seen in that region. In past ages huge serpent-like creatures did actually roam the high seas, and some naturalists have considered the possibility of some of these persisting in the oceanic abysses down to the present times. The most important of these were the mosasaurs (*Pythonomorpha*), rather closely related to true serpents. During the Cretaceous period they were widely distributed and some reached a length of 60 or 70 feet and were extremely elongated and slender, with pointed heads and two pairs of paddle-like limbs.

The only true marine serpents of the present day are the sea-snakes (*Hydrophidæ*), which live in warm seas of most parts of the world, often far from land. All are of small size, with compressed tails, and are very venomous. They feed on fish, are viviparous and produce their young among the rocky shores of islands, etc.

Consult Goode and Bean, 'Oceanic Ichthyology' (Washington 1875); Gunther, 'Challenger Reports' (Vol. XXII, London 1887); Boulenger, 'Natural Science' (1892); Lee, 'Sea Monsters Unmasked' (London 1883); Oudemans, A. C., 'The Great Sea Serpent: An Historical and Critical Treatise' (London 1893); Wilson, A., 'Leisure-Time Studies' (ib. 1878).

SEA-SIDE GRAPE, a small tree (*Coccoloba uvifera*) of the family *Polygonaceæ*, which grows on the sea-coasts of Florida and the West Indies. It has clusters of edible fruit somewhat resembling currants, and a beautiful hard, violet-colored wood, which produces a red dye and a juice known as West Indian kino, that is nearly as valuable as the officinal kino.

SEA-SLUG, a nudibranchiate mollusk. See NUDIBRANCHIATA.

SEA-SNAKE, a venomous, marine East Indian serpent of the numerous family *Hydrophidae*. See SEA-SERPENT.

SEA-SPIDER, a spider-like "no-body crab" of the class *Pantopoda*; also, a spider-crab (q.v.).

SEA-SQUIRT, an ascidian or tunicate (qq.v.), so named from the habit of emitting jets of water from the orifices of the body when touched or irritated in any way. Other less apt names found in British books are sea-pear, sea-pork, etc.

SEA-SWALLOW. See TERN.

SEA-TROUT, a popular name for various fishes, primarily for the common salmon-trout (*S. trutta*) of British waters. In other parts of the world various fishes more or less resembling it are called sea-trout, as the weak-fish (q.v.) in the southern United States.

SEA-URCHIN, an echinoderm of the class *Echinoidea* (q.v.), members of which differ from crinoids or starfishes in their compact spheroid, discoid or heart-shaped forms without arms or a stalk. The numerous species differ greatly in the number and arrangement of the calcareous plates forming the continuous test and in the character of the spines and other appendages with which the latter is studded. Of both fossil and living forms about 250 genera and 4,000 species are known. Although representatives of the 400 or so living species occur in most seas they are more numerous in warm waters, the West Indian fauna being the richest in the world. Regular sea-urchins are distributed widely in the littoral zone, but the irregular ones are especially characteristic of deep waters and the southern oceans, some of them extending to the utmost abysses. The shallow-water forms being subjected to the constant beating of the surf along the rocky shores which they chiefly inhabit are provided with a highly developed system of suctorial ambulacral feet, by means of which they are enabled to retain a hold. Many species also possess the remarkable power of boring into solid rock in which they excavate chambers exactly fitting them and increasing in size with their growth. Frequently the orifice representing the earlier dimensions of the chamber is too small to permit the urchin's escape and the animal is at once imprisoned in its cave and protected from any possibility of injury by the beating waves. The long-spined *Diadema* thus completely honeycombs the surface of the coral rock of the Bahama Islands, etc. Although this power of excavation is most displayed on soft calcareous rocks, the fact that solid granite is similarly bored in some parts of the world shows that it is not the result of a solvent action, but of a slow wearing away of the rock by the jaws and constant movements of the spines. Sea-urchins of most species swallow rock debris and sand in large quantities, digesting the abundant minute animal and plant life which it contains. Most of the species are gregarious, vast numbers collecting in certain areas on the sea-floor until their bodies completely pave the bottom. During the reproductive season, usually the summer, the ovaries and testes, found in separate individuals, become so greatly enlarged that

they fill almost the entire interior of the test. Such forms are called sea-eggs, and this name is sometimes applied to regular sea-urchins generally. In some countries they are baked and eaten while in this condition. The egg-urchin (*Hipponoe esculenta*) of the West Indies is a large species so utilized. But very few species of sea-urchins are found in the shallow waters of the Atlantic Coast of the United States. The green sea-urchin (*Strongylocentrotus drobachiensis*) is very common on the rocky shores of New England and the Pacific States. Besides the diatoms, etc., which it digests from the sand that it swallows, it also devours dead animals of every kind. Another example of the regular urchins is the purple or deep brown *Arbacia punctulata*, which is provided with very stout spines and is found from Cape Cod to the Gulf of Mexico. The species of *Diadema* and *Toxopneustes* occur only in the South Atlantic States. Of the flat or cake urchins (*Clypeasteroidea*) the sand dollars (*Echinarachinus parma* and *Mellita testudinata*) are examples. Both live in great numbers buried in the sand or lying on its surface on shoals, the first being most plentiful northward, the last southward. The heart urchin (*Mora atropos*) is the only example of the *Spatangoidea* that reaches even as far north as North Carolina in shallow water. Many interesting species of this and the other groups have been dredged in the deep water along the continental slopes and elsewhere. See ECHINODERMATA; ECHINOIDEA.

Consult Agassiz, 'Revision of the Echini' and subsequent articles in the *Memoirs of the Museum of Comparative Zoology* (Cambridge 1872); Agassiz, 'Seaside Studies' (Boston 1871); Lang, 'Lehrbuch der vergleichenden Anatomie' (Jena 1894).

SEA-WHIP. See GORGONIA.

SEABOARD AIR LINE RAILWAY COMPANY, the corporate name of a transportation system of southeastern United States. Its main arteries extend from Norfolk and Richmond, Va., southward to Tampa and Venice, Fla., and southwestward to Bessemer and Montgomery, Ala. Under a consolidation agreement of 11 Oct. 1915 the Seaboard Air Line Railway was consolidated on 16 Nov. 1915 under the laws of Virginia, North Carolina and South Carolina with the Carolina, Atlantic and Western Railway under the corporate name of the Seaboard Air Line Railway Company. The Carolina, Atlantic and Western Railway was a consolidation (April 1914) of the North and South Carolina Railway, the Charleston Northern Railway, the South Carolina Western Railway and the South Carolina Western Extension Railway, and had a total mileage owned of 330 miles and 86 miles under construction. Its lines extended from Hamlet, N. C., via Andrews, S. C., to Charleston, S. C., also from Lanes, via Andrews, to the port of Georgetown, S. C., also from McBee, S. C., through Hartsville, Darlington and Florence to a connection with the first-mentioned line at Poston, S. C., with branches to Sumter and Timmonsville. The 86 miles under construction were from Charleston to Savannah, which was opened to freight operation on 15 Oct. 1917 and to passenger operation on 5 Nov. 1917. The former Seaboard Air Line Railway was incorporated

10 April 1900 in Virginia as successor to the Richmond, Petersburg and Carolina Railroad, a 102-mile road between Richmond, Va., and Norlina, N. C. The Georgia and Alabama Railway was acquired by purchase 20 Feb. 1902; other roads were absorbed in November 1901, and the Florida Central and Peninsular Railroad on 27 June 1903, the system comprising lines extending from Richmond, Va., to Atlanta, Ga., and Jacksonville and Tampa, Fla., with numerous branches, embracing in all over 3,120 miles of road. In November 1909 the Atlanta and Birmingham Air Line Railway, 237 miles; the Florida West Shore Railway, 19 miles, and the Tallahassee, Perry and Southeastern Railway, 39 miles, were merged in the Seaboard Air Line Railway. Its total mileage at present is 3,461.34 miles. The property of the Atlantic, Suwanee River and Gulf Railroad Company, the mileage of which had previously been included in that of the Seaboard Air Line, was transferred during the fiscal year 1909-10. In 1911-12 the Seaboard Line absorbed the properties of the Seaboard and Roanoke Railroad and the Roanoke and Tar River Railroad. The Georgia and Alabama Terminal Company is practically merged with the Seaboard, although its corporate existence is maintained. In April 1917 the Seaboard Company took over control of the Tampa and Gulf Coast Railroad and the East and West Coast Railway. It controls by ownership of entire capital stock the Baltimore Steam Packet Company, which operates a fleet of steamers between Baltimore, Norfolk, Portsmouth and Old Point Comfort, Va.; the company also owns a substantial interest in the capital stock of the old Dominion Steamship Company and a one-sixth interest in the Richmond-Washington Company. Under traffic agreement with the Pennsylvania Railroad the Seaboard Air Line Company maintains through car service between New York, Philadelphia, Washington and the South. On 2 Jan. 1908 the company was placed in the hands of receivers. A reorganization plan was drawn up and declared operative on 10 Sept. 1909; on 4 Nov. 1909 the receivership was ended and the road returned to the stockholders. The company's equipment comprises 568 locomotives, 176 passenger coaches, 116 combination, baggage, etc., 105 express and baggage, 23 dining cars, seven mail and two parlor cars, 10,380 box cars, 2,596 flat cars, 70 stock cars, 3,969 gondola cars, 45 coal and coke, 187 caboose cars and 409 miscellaneous. The gross revenue for the year 1917 amounted to \$30,345,146.01, showing an increase over 1916 of \$4,160,658.76; the operating expenses amounted to \$23,097,430.89; the increase over 1916 being \$4,354,832.88; the net income was \$854,067.14; a decrease of \$757,943.48, due largely to war conditions, from the net income recorded in 1916 of \$1,612,010.62. The general offices are at Portsmouth and Norfolk, Va.; and the New York office at 24 Broad street.

SEABRIGHT, N. J., borough in Monmouth County, on the Atlantic Ocean, five miles north of Long Branch, and on the Central of New Jersey Railroad. It is a popular seaside resort. Pop. 1,327.

SEABURY, sē'hū-rī, **Samuel**, American Protestant Episcopal bishop: b. North Groton, Conn., 30 Nov. 1729; d. New London, Conn.,

25 Feb. 1796. He was graduated at Yale College in 1748, and three years later took a course in medicine at the University of Edinburgh. He did not, however, practise this profession, but entered at once upon a course of theological study. He was ordained deacon and priest in the English Church in London in December 1753. Returning to America in the following summer, he became rector of Christ Church, New Brunswick, N. J. In 1757 he took charge of Grace Church, Jamaica, L. I., and in 1766 of Saint Peter's, Westchester, N. Y. In the autumn of 1775 he was obliged on account of his Loyalist sympathies to leave his parish and he resided, during the greater part of the war, in New York. He wrote numerous articles in support of the Tory cause, of which he was one of the ablest advocates, and suffered much, even to imprisonment and exile, for his loyalty to the king, though when peace was declared no one was more faithful to the United States. Immediately after the articles of peace were received in New York, 10 out of the 14 Episcopal clergymen in Connecticut assembled at Woodbury to consider action as to the organization of the Church under the changed civic conditions. On the first formal ballot, they elected Dr. Seabury as bishop. He then sailed for England, and waited in London more than a year for consecration by the English bishops. Owing to the connection between the Church of England and the state, various political reasons stood in the way, and he finally determined, in pursuance of his original instructions, to apply to the Scottish bishops, who were in a more independent position. On 14 Nov. 1784, Seabury was accordingly consecrated at Aberdeen by the bishop and coadjutor-bishop of that see and the bishop of Moray and Ross. He then returned to America and there, in addition to his episcopal duties, assumed the rectorship of Saint James' Church, New London, which he held until his death. His jurisdiction was recognized over Rhode Island as well as Connecticut and afterward over Massachusetts; but the validity of his consecration was denied by many, partly owing to the prejudice excited by his former political attitude. In 1789, however, it was expressly affirmed by the General Convention. Seabury exercised much influence on the final shape of the constitution and liturgy of his Church, especially (in accordance with his agreement with the Scottish bishops) by insisting on the restoration of the oblation of the elements and invocation of the Holy Ghost in the Eucharistic office. He was a man of pronounced views, but of great simplicity, humility and self-sacrifice; and the value of his services to the infant Church can scarcely be overestimated. Consult Beardsley, 'Life and Correspondence of Samuel Seabury' (1881); Tyler, 'Literary History of the American Revolution' (1897).

SEABURY, Samuel, American Protestant Episcopal clergyman, grandson of Bishop Samuel Seabury (q.v.): b. New London, Conn., 9 June 1801; d. New York, 10 Oct. 1872. He was privately educated but took his A.M. at Columbia College in 1823. He was ordained in 1828, was professor of languages at Flushing Institute and Saint Paul's College in 1828-34 and in 1834-49 he edited the *Churchman*. He was rector of the church of the Annuncia-

tion, New York, in 1838-68, and from 1862 he was professor of Biblical learning at the General Theological Seminary, New York. Author of 'The Continuity of the Church of England in the Sixteenth Century' (1853); 'American Slavery Distinguished from the Slavery of English Theorists and Justified by Law of Nature' (1861); 'Theory and Use of the Church Calendar' (1872), etc.

SEABURY, William Jones, American Episcopal clergyman: b. New York, 25 Jan. 1837; d. 30 Aug. 1916. He was graduated at Columbia University in 1856 and received his master's degree there three years later. He took the degree of doctor of divinity at Hobart College in 1874, receiving the same degree from the General Theological Seminary in 1885. Meantime he studied law in the office of the late Stephen P. Nash, was admitted to the bar in 1858 and for a short time engaged in practice. Wm. Seabury succeeded his father in 1868 as rector of the church of the Annunciation, where he remained until 1898. He was appointed to the chair of ecclesiastical polity and law in the General Theological Seminary in 1873 and occupied it until his death. During the latter part of his tenure he was the senior professor in the service.

SEACOAST ARTILLERY. See ARTILLERY.

SEAGER, Henry Rogers, American economist: b. Lansing, Mich., 21 July 1870. He was graduated at the University of Michigan in 1890, at the University of Pennsylvania in 1894, and later studied at Johns Hopkins University, and at Berlin, Halle and Vienna. He was professor of political economy at the University of Pennsylvania in 1897-1902; was connected with the faculty of Columbia University from 1902, and since 1905 has been professor of political economy there. In 1917 he was appointed secretary of the Shipbuilding Labor Adjustment Board at Washington, D. C. Author of 'Introduction to Economics' (1904); 'Economics Briefer Course' (1909); 'Social Insurance' (1910); 'Principles of Economics' (1917), etc.

SEAL, an engraved stamp bearing a device or inscription pertaining to the owner; also, the impression of such a stamp on a plastic substance, such as wax. A seal upon a document was originally a substitute for a signature; a seal upon a place of deposit was for security. The use of seals is of the highest antiquity, and one of the earliest and commonest forms was the signet-ring. In Egypt impressions of seals were made in fine clay, and attached to documents by slips of papyrus. The Romans use clay, bees-wax, and in the time of the empire lead for taking impressions. The use of bees-wax was introduced by the Normans; sealing-wax was invented in the 17th century. Documents in England are still sealed as a formality, but the true voucher to which alone any real importance attaches is the signature.

There are three seals officially used in England by or in name of the sovereign—the great seal, the privy seal and the signet. In the United States, on 4 July 1776, Congress appointed Benjamin Franklin, John Adams and Thomas Jefferson a committee to prepare a device for the great seal of the United States.

The committee reported various devices. William Barton, of Philadelphia, was appointed to submit designs. Sir John Prestwich, an English antiquarian, suggested a design to John Adams in 1779. Combining the various designs of Barton and Prestwich, a seal was adopted 20 June 1782 as follows: Arms: Paleways of 13 pieces argent and gules; a chief azure; the escutcheon on the breast of the American eagle displayed proper, holding in his dexter talon an olive branch and in his sinister a bundle of 13 arrows, and in his beak a scroll with the motto: *E Pluribus Unum*; Crest: a glory breaking through a cloud proper and surrounding 13 stars; Reverse: A pyramid unfinished. In the zenith an eye in a triangle, surrounded with a glory proper, over the eye the words, *Annuit Cœptis*. Beneath the pyramid, MDCCLXXVI and words, *Novus Ordo Sæculorum*. The Confederate seal adopted by the Confederate Congress, 30 April 1863, was designed by Thomas J. Semmes, of Louisiana. The device represents an equestrian portrait of Washington, surrounded by the principal agricultural products of the Confederacy.

SEALING. See SEALS.

SEALING-WAX, a resinous preparation used for securing folded papers and envelopes, and for receiving impressions of seals set to instruments. Ordinary red sealing-wax is made of pure bleached lac, to which when melted are added Venice turpentine and vermilion. Inferior qualities consist of common resin and red-lead, and black and other colors are produced by substituting appropriate pigments. Sealing-wax was invented in the 17th century. Its use for sealing letters has been generally given up in favor of mucilage, which when moistened fastens envelopes much more effectively and with greater rapidity than sealing-wax.

SEALS AND SEALING. Under this term are usually grouped two very widely different types of animals, the so-called fur seals and the hair seals or true seals. The former are not properly seals at all, but are allied rather to the bears, and were appropriately called "sea-bears" by their discovery. The fur seal yields a valuable fur; the hair seal has no fur, but a valuable oil is obtained from its fat and leather from its hide. The principal habitat of the hair seal is in the north Atlantic and Arctic oceans, although small groups of the commoner species are found widely scattered over the globe. The fur seals are more or less widely distributed throughout the southern seas, but are found at the present time chiefly in the north Pacific Ocean and Bering Sea. They are not found in the north Atlantic. The hair seal belongs to the suborder of the *Pinnipedia* and has feet not truly plantigrade, short with long claws. The posterior limbs only are used in swimming and are not susceptible

of bending forward at the knee. When on land the animal cannot walk or run, but merely wriggles with a belly-wise motion, the neck being short and the head scarcely capable of being raised. There is no external ear. The fur seals belong to the suborder of the *Gresigrada*. The feet are plantigrade, the anterior limbs only being used in swimming, having rudimentary claws, if any. The head and neck can be raised as in the bear. The external ear is moderately developed, and the animal can run or lope along the ground as do ordinary mammals and with considerable rapidity. The internal structure of the two animals shows equally marked differences. The hair seals, whatever their origin, must have come from a different parent stock and their relation to land carnivora must be more remote. Beyond the fact that both are carnivorous mammals, feeding on fish and perfectly adapted to life in the water, the two animals have little in common. In both the thick blubber goes with life in the icy waters of the north. They resort, in one case to certain island shores, in the other to the ice floes, to bring forth and rear their young. But these resemblances, associated with aquatic habitat, are only analogies and have no value in scientific classification. In structure, appearance, degree of intelligence, habits, disposition and method of locomotion, the two types are entirely distinct and their evolution as pelagic animals has been along separate lines.

Hair Seals.—The hair seals are found off the coasts of Newfoundland and Labrador, in the waters of the Gulf of Saint Lawrence, in the Greenland seas, and about the island of Jan Mayen, and in the White and Caspian seas. In these places they occur in sufficient numbers to make their hunting profitable. In small isolated groups they are found about the British Isles, among the pelagic islands of the southern seas and about the island shores of the Pacific Ocean and Bering Sea. The principal species hunted are the saddleback or harp seal (*Phoca grælandica*), so named from the peculiar marking thought to resemble an ancient harp; the rough or ringed seal (*P. fætida*), having its name also from color markings; the harbor or common seal (*P. vitulina*), so-called because of its wide distribution and its fondness for bays and sheltered waters; the Caspian seal (*P. caspica*), confined to the sea of that name; the hooded seal (*Cystophora cristata*), so named because of its crest or hood; and the gray seal (*Halichærus grypus*). The two last are unimportant, being taken only when met with in search for other seals. The harbor seal is the commonest form and most widely distributed. But the most important in point of numbers and value of its products is the harp seal, the seal of Newfoundland, of the Greenland seas and the Arctic.

The hair seals show considerable variation in size and coloration. The harp seals are in general whitish or yellowish-white, the nose and head black, the throat and chin spotted with black. The harbor seal is yellowish-gray above, varied with irregular spots of dark brown or black, and yellowish-white beneath with smaller spots. The ringed seal is the smallest form, the gray seal the largest, attaining a length of eight to nine feet. The ordinary species are from five to six feet in length

and weigh from 60 to 300 pounds. The female is slightly smaller than the male, in the case of the harp seal about one-fourth less; but there is no such wide disparity between the sexes as exists in the case of the fur seals. The animals are said to be monogamous. With the exception of the harbor seal, which is non-migratory, the hair seals obey a more or less well-defined semi-annual migration, although their movements are nowhere so definite as those of the fur seals of the north Pacific Ocean. In a general way the herds move southward on the approach of winter, returning to the north and eastward in the spring as the ice recedes. They are found, however, with unfailing regularity at certain definite localities in the breeding season, as for example, the ice fields off Newfoundland, and about Jan Mayen Island. In the vicinity of Newfoundland the young are born between the middle of February and the latter part of March. At Jan Mayen the season is somewhat later, approaching April. The single young, whitish in color at birth, changing to darker, grows very rapidly, attaining a weight and size approximating that of its mother in six weeks or two months. It remains on the ice, the mother returning from her feeding excursions to nourish it. In the course of a month it takes to the water, reluctantly at first, finding it necessary to learn to swim. The young seals form the most valuable part of the catch and yield the best quality of oil. The food of the hair seal consists of fish, in certain species supplemented by mollusks and crustaceans.

Of the various sealing grounds or districts, by far the most important is that of Newfoundland, to which the seals flock in February of each year in "countless numbers." The sealing fleet clears principally from the port of Saint Johns, sailing vessels being allowed to depart as early as 1 March, steam vessels on the 10th, and to begin sealing as soon as the seals can be found. The sealing season extends until the 1 May. In addition to the sealing on the ice the hunting is also carried on by means of nets and guns along the shores of Newfoundland and the Gulf of Saint Lawrence. This form of sealing has been practised from the earliest times and constituted the beginning of the industry, which, however, attained no considerable importance prior to the beginning of the 19th century, the yearly catch probably not exceeding 5,000 seals. Vessels seem to have been first used in this sealing in the year 1763. For the year 1805 we have record of a catch of 81,000. We know that in 1807 the sealing fleet numbered 30 vessels. The catch for 1815 was 126,000 and that for 1822, 306,000. In the period from 1830 to 1850 the Newfoundland sealing industry was at its maximum development. The fleet numbered approximately 400 vessels, with crews aggregating 10,000 men and an annual catch ranging from 500,000 to 700,000 seals. From the close of this period the industry declined, and fewer but larger vessels were employed. In 1871 we find the fleet reduced to 168 vessels. The catch for 1856 was 361,000. It rose again in 1876 to the 500,000 mark, but in 1880 it fell to 223,000. For the 21 years (1881-1901) it averaged 226,000 seals. The catch for 1907 was 245,051 seals and for 1913, 272,065. For the period 1906-13 the ex-

COMMON HARBOR SEAL (*Phoca vitulina*)

ports of seal hides and oil for Newfoundland reached a total value of \$5,208,579. The Newfoundland sealing is essentially a British industry, the major part of the fleet hailing from the ports of Saint Johns and Conception Bay, the English vessels from Dundee and Peterhead. The principal species taken in this catch is the saddleback or harp seal (*Phoca grænlandica*), which constitutes also the bulk of the catch in the Jan Mayen and Greenland sealing.

Next in importance comes the sealing in the vicinity of Jan Mayen Island. This is confined to an area of about 400 miles diameter about the island. The seals arrive in this region somewhat later and some British vessels, after completing the Newfoundland season, go on to Jan Mayen. This sealing is also participated in by German and Norwegian vessels, the former sailing from Hamburg, the latter from Tönberg and Tromsø. The area covered is so limited that this sealing is very destructive. In 1876 it became necessary to establish a closed season for the Jan Mayen sealing, which was accomplished by an agreement among the nations concerned by which sealing in the area between lat. 67° and 75° N. and long. 5° E. and 17° W. should not begin before 3 April. The records for the Jan Mayen sealing extend back to 1720. The catch by a fleet of 19 vessels from Hamburg in 1760 is said to have been 44,000. For 1790 the catch was 45,000; for 1850, 48,000. We learn that in 1868 a fleet of 15 Norwegian vessels, carrying 600 to 700 men, took part in this sealing, the catch for five years preceding this date being approximately 65,000 a year. The British fleet has been smaller, ranging, in the period 1865 to 1871, from 4 to 12 vessels, taking a catch of from 16,000 to 90,000. The best estimates available for the total catch of the Jan Mayen sealing for this period would seem to be about 200,000 seals a year. Since 1880, despite the regulations, this sealing has greatly declined. The statistics for the German and Norwegian vessels are not available, but those for the British fleet are given each year by Thomas Southwell in the 'Zoologist' (London). From this source we learn that the catch for 1881 was 27,894; for 1885, 26,448; for 1887, 1,100; for 1889, 15,079, and for 1891, 1,560. Since 1895 the Jan Mayen sealing has been abandoned by the British fleet.

On the west coast of Greenland a considerable catch of seals is made by the natives. The flesh of the animals is sought for food and the skins for clothing, and they form the chief resources of the inhabitants of the region. The product of this sealing formerly, according to Dr. Rink, in his account of Greenland, averaged about 89,000 seals each year. In recent years it is said to have fallen off to about one-half, probably from the same cause that has affected the Jan Mayen sealing.

At Nova Zembla and in the White and Caspian seas are important sealing grounds worked by the Russians. Professor Schultz in his account of the seal and other fisheries of these waters speaks of the White Sea sealing as covering an area of 230 miles and engaging 2,000 hunters. The methods of sealing and the species sought are the same as in the North Atlantic. The catch has been estimated at from 65,000 to 75,000 a year. The Caspian Sea sealing is more

important, the annual catch for five years prior to 1882, as given by Professor Schultz, was 130,000. Statistics regarding the results of sealing in the White and Caspian seas in recent years are not available.

The methods employed in taking the seals vary with the different conditions under which the animals are found. Along shores of Newfoundland nets and sealing frames are used. A common form of net is one making with the shore an oblong enclosure, the ends capable of being lowered as the animals approach and raised after they are within. They are then frightened until they have hopelessly entangled themselves in the meshes of the suspended net. Two men manage such a net, which may be as much as 150 fathoms in length and in a single such net 1,800 seals are said to have been taken in one season. The natives of Greenland use the net also, but employ chiefly the harpoon or spear with wooden shaft and detachable head, the latter secured to the boat by means of a cord by which the captured animal is drawn up to the hunter and dispatched with the club or knife. Stationary nets are also used in connection with the rocks where seals are accustomed to haul out to rest and also about their breathing holes in the ice. Deadfalls, sealing hooks and other devices are used as circumstances warrant. But the really important method of capture is that used upon the ice fields where the seals are found congregated in immense herds. When a vessel has sighted seals its hunters are put ashore on the ice. They round up the animals, cutting them off from the open water and then club them over the head. When the seals are all killed the hunters remove the skins, with the adhering layer of blubber, and drag them back to be stored in the ship. This process is repeated layer of blubber, and drag them back to be found, or a cargo is obtained. At port the fat is separated from the skin and the latter preserved by salting. The fat is rendered into oil. In former times this was accomplished by throwing it into huge vats to melt by its own weight under the action of the sun and weather. In recent years this method has been replaced by the more rapid one of rendering by steam. The oil thus obtained is used as a lubricant and luminant and in the manufactures. The hides are made into leather and used for a variety of purposes, among them the covering of trunks and knapsacks.

The vessels used in the sealing industry were originally small sailing schooners. Steam vessels began to be used about 1866, and have gradually superseded the sailing vessels. Of the fleet of 107 vessels of 1873, one-fifth are said to have been steamers. At the present time steam vessels are employed almost exclusively in the Newfoundland and Jan Mayen sealing. The ships must be staunchly built with iron-shod prow for breaking through the ice and with strength to withstand the pressure when caught in the shifting ice. The business is a hazardous one, vessels not infrequently being wrecked by storms or ground to pieces between the icebergs. Vessels sometimes fail to come up with seals and so return empty. But the catches are in the main good and at times exceptionally so. Catches of 30,000 to 40,000 seals are not infrequent for single vessels, and each animal is worth from one to

three dollars, a rich booty for a season of from six weeks to two months. In the case of steam vessels the men of the crew share one-third of the catch among them, two-thirds going to the owners of the vessel. The catch is divided equally between crew and owners in the case of sailing vessels.

It is not easy to bring together in any complete way the statistics of the hair-seal industry. For the period 1881 to 1901, Mr. Southwell, in his annual notes in the 'Zoologist' on the 'Seal and Whale Fishery,' gives rather complete data for the British fleet taking part in the Newfoundland and Jan Mayen sealing. His figures do not, however, include the shore hunting and the seals taken by sailing vessels. The following table is compiled from his annual notes:

CATCH OF STEAM SEALING VESSELS OF THE BRITISH FLEET.

YEAR	Greenland sealing		Newfoundland sealing	
	Vessels	Catch	Vessels	Catch
1881.....		23,894	13	139,985
1882.....	8	22,142	13	63,204
1883.....	13	37,920	31	286,000
1884.....	12	39,700	20	192,175
1885.....	10	26,448	19	211,587
1886.....	3	4,500	18	195,396
1887.....	1	1,100	20	177,733
1888.....	4	13,388	16	210,810
1889.....	4	15,079	19	303,287
1890.....	7	6,603	19	209,000
1891.....	5	1,560	19	343,495
1892.....	5	3,478	20	349,369
1893.....	3	325	22	129,060
1894.....	3	4,712	21	152,821
1895.....			20	270,058
1896.....			20	187,516
1897.....			21	126,628
1898.....			18	241,708
1899.....			18	268,787
1900.....			19	353,276
1901.....			19	345,380

Of the value of the total product of the industry various estimates are available. The catch of 1857 of 500,000 seals is valued at \$2,125,000. This sum was divided among 375 vessels and 13,600 men. The catch of 1871 of 486,262 seals is said to have yielded 6,943 tons of oil valued at \$972,000, the skins themselves being valued at \$486,262, making a total of \$1,458,262. These figures related to the Newfoundland catch. For the years 1895-1901, Professor Southwell gives the following estimates for the catches of these years as shown in the preceding table:

1895.....	£77,824
1896.....	55,362
1897.....	32,564
1898.....	80,000
1899.....	68,527
1900.....	96,720
1901.....	77,819

The following exports of seal products for Newfoundland are recorded in 'The Statesman's Yearbook':

YEAR	Seal skins	Seal oil	Total
1906.....	\$314,048	\$297,430	\$611,478
1907.....	164,509	447,967	612,476
1908.....	140,137	308,997	449,134
1909.....	433,620	252,262	685,882
1910.....	460,220	459,814	920,034
1911.....	275,287	385,250	660,537
1912.....	380,693	296,519	677,212
1913.....	321,551	270,275	591,826
1916.....	206,449	403,640	610,089
Totals.....	\$2,692,514	\$3,122,152	\$5,818,668

The number of seals taken in 1916 is given as 241,302, and for 1917 only 196,228.

When the hair-seal industry was in its prime its total catch from the various grounds numbered about 1,000,000 seals annually, at a value of approximately \$3,000,000. The catch has fallen off in recent years, perhaps to one-half, but the industry is still a valuable one and worthy of such measures as may be necessary to preserve and perpetuate the race of animals upon which it depends. The fate of this industry in the North Atlantic Ocean would seem to be equally important with that of the fur-seal industry in the North Pacific Ocean. The danger which seems to threaten in one case is much the same as in the other — indiscriminate and wasteful killing.

Fur Seals.—The fur seals or sea bears constitute two groups or genera, *Arctocephalus* (*A. townsendi*, Guadalupe Island; *A. philippi*, Galapagos Islands; *A. australis*, southern coasts of South America and neighboring islands; *A. forsteri*, coasts of New Zealand and southwestern Australia; *A. delalandi*, islands off South Africa; *A. gazella*, Kerguelen and Prince Edward Island), once numerous and widely distributed among the pelagic islands of the southern hemisphere but now practically extinct through indiscriminate slaughter in the greater part of its habitat, remnants of importance only existing on Lobos Island, in the mouth of the River Plata in Uruguay, and on the islands of Cape Horn, receiving in both places government protection; and *Otoës* (*Callorhinus*), *O. ursinus*, Commander Islands; *O. alascanus*, Pribilof Islands, in Bering Sea, and *O. curilensis*, Kurile Islands and Robben Island, in the Sea of Okhotsk, limited to the waters of the North Pacific Ocean now the sole variety of any considerable commercial importance.

The typical male fur seal or "bull" attains maturity at about the age of seven years, weighs from 400 to 500 pounds, is about six feet in length and has a girth of four and one-half feet. His color is blackish or dark brown, with yellowish-white water hairs, especially long on the back of the neck, forming the so-called "wig" or mane. The fore-limbs or flippers, with broad membrane connecting and extending beyond the toes, are used in swimming. The animal stands erect and runs or lopes along the ground when on land. The adult female or "cow" is smaller, averaging about 80 pounds in weight, with length and girth in proportion. Her fur is of varying shades of brown. She bears her first young or "pup" at the age of three years. The breeding grounds are boulder-strewn beaches or rocky-hill slopes near the shore, and on these the gregarious instinct of

SEALS

A Herd of Fur Seals, Gorbatch Rookery, Pribilof Island, Alaska

the animals leads them to congregate in closely set masses called "rookeries." The fur seals are polygamous, each adult bull getting about him as many cows as he can control; these family groups forming the unit of rookery life are called "harems," and range in size from 1 to 100, depending upon advantage of location, the average size being about 30. The bulls reach the islands early in May and select their places, awaiting the arrival of the cows which begins early in June. The incoming is gradual, the number on the rookeries growing steadily to a climax at about the middle of July, when the greatest number (not, however, more than one-half at any one time) are present, the number diminishing to one-fourth at and after the close of the breeding season about the 1st of August. The single pup, weighing 10 to 12 pounds and black in color, soon changing to gray, is born within 6 to 48 hours after the arrival of the mother. Within a week she is served by the bull and goes away to sea to feed, returning at gradually lengthening intervals to nourish her young, which remains on shore. The young males of one, two, three and four years, called "bachelors," herd by themselves on beaches adjacent to but distinct from the breeding grounds, the fact upon which depends the principle of land killing by which only the superfluous males are taken. The bulls having fasted since their arrival in May go away early in August to feed. The pups learn to swim at the age of six weeks and in November, on the approach of winter, swim away with their mothers to the south. The winter migration of the Pribilof Islands herd extends to the latitude of Southern California, which is reached by a more or less direct route through the ocean, late in December. The return journey is made more slowly and follows the outline of the coast. The Commander Island seals make a similar journey to the southern extremity of Japan and return on their course. The seals of Robben Island have their migration route in the island sea of Japan. The fur seals find their food, chiefly squid (*Gonatus amoenus*) and a small smelt-like fish (*Therobromus calorhini*), in deep water, and their feeding grounds in Bering Sea and on the spring migration lie in a general way along the 100-fathom curve.

We owe our first knowledge of the fur seals of the north Pacific to Georg Wilhelm Steller, the naturalist of Vitus Bering's second voyage, in 1841. On the return trip Bering's ship was wrecked on one of the two islands now known in his honor as the Commander Islands. The survivors of the wreck wintered on Bering Island where the great commander died. Steller succeeded to the command of the expedition and during the winter made a study of the fur seals or sea bears, among other animals which he found on the island, the great rookeries of Bering Island furnishing him with a wealth of material.

The Commander Islands lie in Bering Sea in lat. 55° N. and long. 166° E., 97 miles to the eastward of the peninsula of Kamchatka and 180 miles to the westward of the island of Attu, the westernmost land of the Aleutian Archipelago. They are barren, mountainous stretches of land of no interest or importance aside from the fur-bearing animals found upon them. In

addition to the fur seals, the blue or Arctic fox was once numerous, as was also the sea-otter, the latter now very scarce because of excessive hunting. The sea-lion and the sea-cow or manatee were also found in numbers about these islands. The latter is now extinct. Bering Island is the larger of the two. It is about 35 miles in length by an average width of about 15 miles. Its companion, Copper Island, is very much smaller. Small villages exist on each island in which the native sealers and the officials of the government and commercial company live. The islands belong to Russia, having remained in her possession since their discovery in 1741.

The Pribilof Islands are the home of the most important of the northern fur seal herds. They lie in the eastern portion of Bering Sea, about 200 miles from Cape Newenham on the mainland of Alaska and a like distance from the island of Unalaska, in lat. 56° N. and long. 170° W. There are five islands in the group, of which two only, Saint Paul and Saint George, are important, the former having an extreme length of 13 miles and a width of about 7. Saint George Island is about one-half as large. Like the Commander Islands they were unknown to aboriginal man. They were discovered in 1786 by Gerassim Pribilof, a Russian navigator in the employ of the trading companies then engaged in exploiting the resources of the Commander Islands and already seeking new fields. Each island has a native village with its company store, Greek-Russian church and American school. The village of Saint Paul numbers about 200 people, that of Saint George half as many, natives from the Aleutian Islands brought over in the early days by the Russians to work the fur seal industry. The natives are paid for their labor at so much per skin, the present price being 50 cents. The sum thus earned is treated as a community fund and is divided among the heads of families on the basis of age and skill. When the annual quota numbered 100,000 skins the natives were rich. Since 1890 the catch has declined steadily, not exceeding an average of 15,000 annually for the period ending 1911. In 1912 the commercial catch was cut off for five years. Congress has by annual appropriation supplemented the earnings of the sealers and is now maintaining them as wards of the government. The affairs of the islands were until 1904 administered by the Treasury Department through agents residing on the islands. In 1904 the islands were transferred to the Department of Commerce and managed as a separate division. Since 1909 they have been under the special charge of the Bureau of Fisheries. The Pribilof Islands were joined with the Commander Islands, and remained under the control of Russia until 1867, when they passed, with the Territory of Alaska, into the possession of the United States.

After many experiments, some of them disastrous, the Russians worked out a system of management of the fur seal industry which with slight modifications is still in vogue on the islands. The important feature of this system is the absolute protection of the female herd. The land sealing is confined to the young males of two and three years of age, 29 out of every 30 of which are superfluous for breeding purpose, owing to the polygamous habit of the

animals. These young males, as they rest on their hauling grounds, are surrounded at night by the sealers, rounded up and driven slowly inland in great droves of from one to 3,000. On the killing grounds the large droves are gradually broken up into small groups or pods of from 20 to 50. From these men armed with stout clubs knock down those of killable size, leaving those too large or too small to escape and return to the water. The skins are removed by other workers. A crew of 20 to 30 men will thus kill and skin 1,500 to 2,000 seals in half a day. The different hauling grounds are driven in succession during the killing season, which lasts from 1 June until about 1 August, after which time the skins begin to get stagey, owing to the shedding of the water hair. The skins are gathered up and salted in kenches. After remaining in the salt for 10 days or two weeks they are taken out and wrapped in bundles, two in each, and are ready for shipment. They are eventually shipped to London, where practically all the seal-skins of the world are prepared for use. The two important processes in the treatment of the raw skin are the removal of the coarse water hairs, which have to be carefully plucked out, and the dyeing of the fine under fur. Both require the greatest skill, and when the skin has been thus dressed and dyed its value has been doubled. When the United States came into possession of the Pribilof Islands in 1868, following the example of Russia, she leased the fur seal industry to the Alaska Commercial Company, which controlled the industry for a period of 20 years. The company paid a rental of \$55,000 a year for the islands and a royalty of \$3 on each skin taken. During the period of its lease the company took an average annual quota of 100,000 skins. The government also derived revenue from import duties on dressed sealskins brought over from London for consumption in this country. In all, the government received during this first period of 20 years, in rental, royalty and import duties, nearly \$13,000,000, or about twice the total cost of the entire Territory of Alaska. It is needless to say that the industry proved a source of wealth to the company controlling it. The same company leased the Commander Islands from Russia and took there a quota of about 50,000 skins a year. In 1890 the fur seal industry of the United States passed into the hands of the North American Commercial Company for a term of 20 years. The terms of the new lease were more advantageous to the government, the royalty on each skin being approximately \$10. The fur seal herd had, however, suffered a serious decline in its breeding stock and this became evident in the first year of the new lease when only 21,000 skins were taken. A catch of 30,000 skins was taken in 1896, but the average for the 20 years did not exceed 15,000 skins. The cause of this decline was found in the development of a rival sealing industry, the hunting of the seals in the open sea while on their migrations and feeding excursions.

Pelagic sealing, as this hunting is now called, is the outgrowth of a custom practised by the Indians of the Northwest Coast from the earliest times. Going out from the shore in the vicinity of Cape Flattery and Vancouver Island in their canoes they captured with the spear such

stragglers from the migrating herd as came within their reach. The number of animals taken in this way was small, probably not exceeding 5,000 a year, until 1879. The skins found their way to the markets through the traders and, as sealskins increased in value, this irregular source of supply became an object of attention. In 1879 vessels began to be used to convey the Indians and their canoes out to the main body of the herd, to remain with them, affording shelter at night and in time of storms, and enabling the hunters to move with the progress of the herd. From a single vessel in 1879 the pelagic industry expanded enormously until in 1891 the sealing fleet numbered 122 vessels, each with from 5 to 20 sealing crews, and in 1894 it made a total catch of 143,000 seals. From this point the pelagic catch declined steadily with the diminishing herd. In 1902 it numbered about 15,000 seals or about the average land catch at that time. The methods of pelagic sealing may be described as follows: When the sealing vessel comes into sight of seals its boats are lowered and the hunters put off to windward in diverging directions. The spearsman stands in the bow and the steersman manages the boat. The seals are usually found sleeping on the surface of the water. The boat approaches noiselessly and the spear is thrown by means of a long detachable shaft. The spear head is attached to the boat by a line, and when the captured animal is tired out it is drawn up to the boat and killed with a short club. If the shotgun is used the animal is similarly approached and, after being shot, the body is quickly recovered with a gaff to prevent its sinking. The operations of the sealing fleet were gradually extended from the vicinity of the Straits of Fuca until they covered the entire migration route of the Pribilof herd, from the Santa Barbara Channel to the passes of the Aleutian chain. Finally it entered Bering Sea and attacked the herd on its summer feeding ground. In a similar way the pelagic fleet covered the migration route of the Commander herd.

Pelagic sealing was necessarily indiscriminate, as the sex of the animal could not be distinguished in the water and the hunter tried to kill every animal found. The killing of the males on land naturally left the herd as found at sea composed chiefly of females. The killing of the female seal on the spring migration involved the death of her unborn offspring. When killed in Bering Sea in August and September her dependent young was left to starve on the rookeries. Investigations of the pelagic catch in 1895 and 1896 showed the percentage of females in the pelagic catch for these years to be 63 and 84 per cent respectively. In the latter season 20,000 starved pups were counted upon the rookeries of Saint Paul and Saint George, their mothers having been killed at sea.

Aware of the disastrous effects of pelagic sealing, and acting under shadow of a claim made by Russia in 1820 to absolute jurisdiction over Bering Sea in the interests of her fur seal herd, a claim since found untenable, the United States in 1886 began seizing sealing vessels operating in Bering Sea, among them Canadian vessels. This brought on a diplomatic discussion with Great Britain which dragged

along until 1892, when the two nations agreed upon a treaty submitting to a court of arbitration the question of jurisdiction in Bering Sea, and of what regulations, if any, were necessary for the protection and preservation of the fur seal herd when beyond the ordinary territorial limit of three miles. This tribunal of arbitration met in Paris in the spring of 1893 and rendered its decision in August of the same year. The decision on the legal questions involved was adverse to the contention of the United States and, as provided in this event, a set of regulations was formulated for the protection of the herd, to be enforced jointly by the two nations. These regulations provided, after the analogy of game laws, for a closed season in May, June and July, when all sealing should be suspended, and for a closed zone of 60-miles radius about the islands, within which no sealing whatever should be allowed. The closed season covered the breeding period, the protected zone was supposed to provide a safe feeding ground for the mother seal while her young was dependent upon her. The regulations, however, failed of their object, because the mother seal does not feed within the protected area, but far outside of it. She was, therefore, taken by the pelagic sealer as before, and her young was left to starve. The largest catch in the history of pelagic sealing, that of 1894, was made in the first season of the operation of the very regulations designed to so limit and restrict pelagic sealing as to protect and preserve the herd.

In 1896, because of the continued decline of the fur seal herd, it was agreed between the United States and Great Britain to reopen the question with a view to a possible revision of the regulations, and each nation sent a scientific commission into Bering Sea to inquire into all facts relating to seal life. The commission for the United States was under the direction of President David Starr Jordan of Stanford University, California, that for Great Britain, under the direction of Prof. D'Arcy Wentworth Thompson of University College, Dundee, Scotland. At the close of the investigations which covered the seasons of 1896 and 1897, the two commissions met at Washington in a joint conference known as the Conference of Fur Seal Experts, and after a full discussion of the results of their labors reached an agreement on all essential facts, establishing the fact of decline, its probable rate and its cause. The cause was fixed as the killing of females at sea involved in pelagic sealing and the agreement foreshadowed—commissions having no power to consider ways and means—the abolition of pelagic sealing as the only means of saving the herd. On the basis of this agreement the fur seal question passed into the hands of the Joint High Commission called at Quebec in 1898 to consider this among a number of other questions in dispute between the United States and Canada. Unable to reach an agreement on the boundary dispute this Joint Commission accomplished nothing in the fur seal matter. In 1903 a Japanese sealing fleet joined the Canadian and as the Japanese sealers were not bound by the regulations of the Paris Award they were able to establish themselves on the three-mile territorial limit about the islands and to operate throughout the summer. Under these con-

ditions the damage to the herd was greatly increased and its extermination threatened. In 1911 negotiations for the abolition of pelagic sealing were taken up anew, Russia and Japan participating in them. The conference was held at Washington and the treaty, suspending pelagic sealing for 15 years, was signed by the United States, Great Britain, Russia and Japan on 7 July. It was duly ratified and went into effect in the season of 1912. This treaty provided that the United States and Russia, as owners of the principal seal herds, should share their land catches with Canada and Japan, 15 per cent each to each, in return for the abandonment of pelagic sealing. Unfortunately in enacting the law necessary to give this treaty effect Congress added a clause suspending land sealing on the Pribilof Islands completely for five years and limiting its extent for nine further years, practically the full life of the treaty. This law was enacted 24 Aug. 1912, and in the four seasons which have passed it has caused a loss of approximately \$2,000,000 to the three nations concerned under the treaty. If its provisions are fully carried out the loss will reach a total of not less than \$4,500,000 and the excess of male life created upon the rookeries will be injurious in high degree to the herd.

With the close of the lease of the North American Commercial Company in 1909 the government entered upon the direct control and management of its fur seal herd. The catch of 13,000 skins for 1910 was taken by the government agents and sold in London for \$437,000, yielding to the treasury nearly four times as much as would have been received under the leasing system. The similar catch of 1911, amounting to 12,000 skins, brought \$423,000. The catch and attendant income should not have fallen below the figure of 1911 for with that season pelagic sealing ceased and the herd began to increase.

It is probable that in the days of its greatest prosperity (1870-85) the fur seal herd of the Pribilof Islands numbered 2,500,000 animals of all classes. In 1912, at the time of its release from the drain of pelagic sealing, the herd numbered approximately 250,000 animals. The Russian herd of the Commander Islands, originally about one-half the size of the American herd, had suffered practically the same proportionate decline. These herds under protection at sea will increase year by year at approximately 15 per cent until they again reach their maximum limits, determined in all probability by the question of food supply which they must find in the open sea. In 1919 the Alaska herd was estimated at 600,000.

In addition to the fur seal herds of the north Pacific Ocean two herds of the southern hemisphere yield a limited supply of skins. One of these is the herd of Lobos Island off the mouth of the river La Plata, in Uruguay, yielding 12,000 to 15,000 skins annually, and the other, on islands off Cape Horn, yielding 5,000 to 10,000 annually.

The herd of the Pribilof Islands alone has yielded, since its discovery in 1786, approximately 6,000,000 sealskins. In its present state it is capable of yielding an annual catch of 15,000 skins and this will rise steadily to a maximum of 100,000 to 150,000. Sealskins in the past 20 years have ranged in value from

\$20 to \$50 each. The herd is a governmental resource of great importance and value.

Jr., University.

SEALSFIELD, sēlz'fēld, Charles, pseudonym of KARL ANTON POSTL, Austrian novelist: b. Poppitz, Moravia, 3 March 1793; d. Solothurn, Switzerland, 26 May 1864. He early entered a monastery and was ordained in the priesthood, but in 1822 fled to Switzerland and thence to the United States where he lived in 1822-26 and 1827-30. In 1829 he edited in New York the *Courier des Etats Unis*, and after 1832 made his residence chiefly in Switzerland, though he visited the United States at intervals. He subsequently engaged in novel writing, his work creating a sensation in Germany. His publications include 'Die Vereinigten Staaten von Nordamerika' (1828); 'Der Legitime und die Republikaner' (1833); 'Lebensbilder aus beiden Hemisphären' (1835-37); 'Das Kajütenbuch' (1840); 'Süden und Norden' (1842-43), etc.

SEAMAN, Louis Livingston, American surgeon: b. Newburgh, N. Y., 17 Oct. 1851. He was graduated at Cornell University in 1873, at Jefferson Medical College in 1876 and at University Medical College, New York, in 1877. He was resident surgeon in the New York State Emigrant Hospital in 1877-79; superintendent of the State Emigrant Insane Asylum in 1879-81 and chief of staff at Blackwell's Island in 1881-85. He made a tour of the world and special study of the contagious diseases of the Orient in 1886. He was surgeon with rank of major in the American War with Spain; served with the Second Imperial army of Japan in Manchuria in 1905, and was special correspondent of the *Independent* in the European War. Author of 'The Real Triumph of Japan' (1906); 'Triumphs of Medical Science in Peace and War in Foreign Lands' (1908); 'The Tse-Tse Fly and Sleeping Sickness' (1908); 'Fair Play for the Republic of China' (1912); 'The Aftermath of the Balkan War' (1914); 'Crucifixion of Belgium' (1916), etc.

SEAMAN, sē'man, Owen, English writer: b. 18 Sept. 1861. He was educated at Clare College, Cambridge, in 1888 became lecturer in literature at the Durham College of Science (Newcastle-on-Tyne), and in 1890 was there appointed to the newly-established professorship of literature. In 1897 he was admitted barrister of the Inner Temple. He began contributions in 1894 to the *National Observer*, in

1895 to the *World* and in 1894 to *Punch*, whose staff he joined in 1897, and of which he became editor in 1906. Among his books of verse are 'With Double Pipe' (1888); 'Horace at Cambridge' (1894); 'Tillers of the Sand' (1895); 'The Battle of the Bays' (1896); 'In Cap and Bells' (1899); 'Borrowed Plumes' (1902); 'A Harvest of Chaff' (1904); 'Salvage' (1908), and 'War Time Verses' (1915).

SEAMAN, a person below the rank of officer who is employed in the navigation of a vessel either coastwise or on the high seas. The word "sailor" is broader in meaning than that of seaman, including men employed on inland waters as well as at sea, and in the United States, with a vast area of navigable lakes, sailor is the term more generally used. Seamanship is, of course, as old as navigation, and that originated before the historic period. Although in ancient times vessels were propelled to a great extent by the labor of slaves, chained to the oars they handled, the men engaged in navigating ships were usually free, and the ancient seamen appear to have had more voice in matters affecting the voyage than seamen have to-day. Commerce by water was the chief source of the wealth which made Tyre and Carthage, and some of the Greek cities in Asia and Europe rich and powerful, and skilful seamen were, therefore, in great demand. Similar conditions prevailed in the more prosperous republics of the Middle Ages and the Northmen who spread their sails in search of lands they could plunder and subdue were sailors and warriors both.

The discovery of America gave a great impulse to seamanship and may be said to have created a new race of sailors, who were also adventurers and whose feats of navigation have never been surpassed for daring, skill and achievement. In the early days of the American colonies and indeed up to the time when manufactures attracted the surplus population of the rural districts, Americans might almost have been called a race of sailors. They sailed around the world in their merchant ships, fighting French privateers and, when nearer home, dodging English revenue cutters, and in this school of varied hardship and adventure they learned the lessons of seamanship as no others had learned it before. Good sailing ability to navigate a ship to the best advantage was almost as requisite as good gunnery in the naval battles of a century ago, and America's splendid naval record of 1800 to 1815, in combat with French, Barbary pirates and British proves that American seamen could both navigate and fight.

The seamen in vessels trading in American ports for years have been mostly of foreign origin. Scandinavia supplies a large proportion of them and they are excellent sailors. Strict laws are on the statute books regulating the engagement and treatment of seamen, their claims to pay and their discharge and return to this country, if abroad. Seamen can no longer be beaten and cuffed with impunity by brutal shipmasters. The authorities, both civil and criminal, are quick to uphold the cause of a seaman who has a real grievance. Merchant seamen make their contract by signing a written agreement called the shipping articles. This must set forth the voyage, the ports at each end and all other matters which are necessary

to an intelligent understanding of the contract. The contract, when signed, is not absolute evidence of agreement on the part of the seaman, who may prove, if he can, that he was induced to sign by fraudulent representations, or while irresponsible. The law provides penalties for violation of the contract by either party; the amount and quality of provisions while on a voyage are regulated by statute, and the master is bound to pay the wages due, unless he can show that the seaman has been insubordinate or inefficient. A seaman refusing, without good cause, such as illness or other disability, to do the work assigned to him may be put in irons while on board and prosecuted in the nearest United States court. If he deserts he may be arrested and punished by forfeiture of wages and imprisonment. He can justify desertion by proof of cruel treatment. If a seaman is discharged without cause and against his will in a foreign port the master can be punished by six months' imprisonment or a fine of \$500. If the seaman, who has done his duty, is willing to be discharged abroad, and the master on his part is willing to let the man go, the master must pay him three months' wages beyond what is due, one-third of which amount goes to a fund for the maintenance of American seamen abroad and for bringing them home. It is part of the duty of American consuls to be vigilant in the protection of American seamen, and the master of a vessel must present his papers for examination by the American consul or consular agent in all ports visited and must explain the reasons for the absence of anyone entered in the list of the crew.

Unfortunately many seamen are ignorant of the provisions of law intended to guard them from abuse and imposition, and the dissipation in which many of them indulge when on shore helps to make them easy victims of unscrupulous boarding-house-keepers and shipmasters, who conspire to rob them of advance money and virtually kidnap them on board vessels on which they had no intention of sailing. This evil is undoubtedly winked at, in some instances, by corrupt officials, who presumably receive a share of the proceeds. Some outrage, greater than usual, calls attention at intervals to the wrongs being perpetrated on seamen, and then there is a brief spasm of public anger and talk of prosecution and reform. This dies out, as a rule, without serious action having been taken and matters go on as before. The lot of the American seaman is, however, immeasurably better than it was in the early part of the 19th century, for now the law is on his side, when invoked, whereas formerly all its power was exerted on the side of the shipmaster, however cruel and unscrupulous.

In England also the seaman has had ample legal protection for over half a century, since the passage of the Mercantile Marine Act of 1850, which lays down minute rules for the government of both masters and seamen. The provisions of the act are very similar to the American laws bearing on the same subject.

The decline of the American merchant marine is attributed largely to the fact that, as a sop to American labor unions, laws were passed obliging vessels carrying the American flag to comply with certain regulations tending to in-

crease the pay of the seamen. Because vessel-owners could hire seamen in foreign ports cheaper than in the United States they have chosen almost universally to fly a foreign flag. The World War, with the indiscriminate sinking of neutral craft by German submarines, stimulated the United States government to inaugurate a heavy shipbuilding era, and the consequent demand for American seamen has resulted in increased pay and better conditions.

In 1915 the Congress passed a new seamen's act providing improved conditions as to hours, food, sleep, pay, living quarters and terms of service. One clause called for 75 per cent of the crew to be able to understand orders in English. Penalties for desertion were removed and one-half the wages due were made payable on demand at any port; assignments of wages were voided. On the other hand, the seamen can be dismissed for cause, even in a foreign port, by taking certain action before a United States consul, but to deliberately abandon a seaman in a foreign port is punishable criminally. Seamen's quarters are prescribed to be not less than 16 square feet of deck and 120 cubic feet of air space per individual; washing and toilet arrangements are ordered and medical care and attendance.

SEARCH, Right of, so far as it applies to the homes, persons, papers and effects of American citizens, is regulated by the Fourth Amendment to the Constitution of the United States, which provides that the right of the people to be secure against unreasonable searches and seizures shall not be violated. This provision appears also in State constitutions. A magistrate should issue a search warrant only on evidence sufficient for a reasonable presumption that stolen articles, or articles used in violation of law, such as gambling implements, are to be obtained by the search, or that evidence essential to a prosecution for serious crime may thus be secured. An officer holding a warrant for the arrest of a person charged with crime may enter upon any premises where he believes that person to be, but is responsible both civilly and criminally for abuse of his authority. If an officer makes an arrest without lawful authority he is liable for false imprisonment. Persons not charged with crime may be arrested and detained as witnesses.

The extent of the right of search by belligerents of the vessels of neutrals is a much disputed question, and although it has been agitated for over a century it is far from a comprehensive and satisfactory decision. The assertion by Great Britain, during the wars with Napoleon, of the right to search American vessels on the high seas for alleged deserters from the British navy—some of whom were hanged after being taken from an American man-of-war—provoked the War of 1812. When peace was made, although other points in dispute were adjusted, this question was left unsettled, England, at that time, making no further attempt to interfere with American vessels, and the fall of Napoleon removing the causes which had led to England's high-handed measures.

The Declaration of Paris, signed by the plenipotentiaries of France, Russia, Great Britain, Austria, Prussia, Turkey and Sardinia, 16 April 1856, sought to settle the various questions relating to the right of search, declared

privateering abolished, that the neutral flag covered enemy's goods, except contraband of war, that neutral goods, except contraband of war, were not liable to seizure, even under the enemy's flag, and that blockades, to be binding, must be effective. The United States did not assent to this declaration, and matters were in this condition when the American Civil War broke out.

In 1861 a collision between the United States and Great Britain was nearly caused by the unauthorized action of the commander of a Union war-vessel, who stopped the British mail steamer *Trent* on the high seas and took from the *Trent* as prisoners Messrs. Slidell and Mason, commissioners of the Confederate States proceeding to Europe. England made preparations for war, but the government at Washington disavowed the stoppage of the *Trent* and released the commissioners. No privateers were chartered by the United States either during the Civil War or the Spanish-American War. In the latter conflict the United States and Spain proclaimed their intention to adhere to the principles of the Declaration of Paris, and this determination was adhered to throughout the war.

The right to search a neutral vessel for contraband of war is universally admitted, this right, however, being confined to private merchant vessels and not applying to ships of war. The exercise of this right must be conducted with due care and regard to the rights and safety of vessels. All civilized powers also exercise the right of stopping and searching and, if cause be found, seizing or destroying, should resistance be shown, a vessel suspected of piracy or slave-trading. The right of search came into prominence again in 1914, 1915 and 1916, when Great Britain went to the limit in stopping neutral vessels in nearby waters and taking them to British ports. The action was violently opposed by many American shippers and was the subject of considerable diplomatic correspondence between the United States and British governments. Owing to the fact that American sympathies were mainly pro-British and that the United States later joined the Allies in the Great War, the entire question was dropped, and the conditions of right of search remain more indefinite than ever. See BLOCKADE; CONTRABAND OF WAR; PARIS, DECLARATION OF.

SEARCH WARRANT is a warrant requiring the officer to whom it is addressed to search a house or other place therein specified for property therein alleged to have been stolen, and if the same shall be found upon such search, to bring the goods so found, together with the person occupying the same, who is named, before the justice or other officer granting the warrant, or some other justice of the peace or other lawfully authorized officer. It should be given under the hand and seal of the justice and dated. The right is now extended to the search for other articles the possession of which is forbidden by law. The Constitution of the United States declares that "the right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated; and no warrants shall issue, but upon probable cause, supported by oath or affirma-

tion, and particularly describing the place to be searched, and the person or things to be seized."

SEARCHLIGHT, a light-projecting apparatus by which electric-light rays are concentrated and reflected practically parallel in a beam to a great distance thereby disclosing to view at night objects far off. The source of introduction of the searchlight was the lighthouse, where metallic parabolic mirrors have been in use for many years. The rapid dulling of the metal surface led to using silvered glass reflectors, but the parabolic form in glass was not attainable for a long time, hence spherical surfaces were in use of necessity. This, however, made focal arrangement at angles necessary to diminish deviation of the reflected light from parallelism. Fresnel's investigations produced fine results along the line of knowledge, such as that the rays transmitted from a convex glass lens are in a nearly parallel beam so long as the diameter of the lens is small compared to its focal length, and but a small proportion of the light coming from the source is available. Fresnel's lenses were constructed of concentric rings and, surrounding the lens, totally reflecting prisms directed the light rays falling outside the prisms into the direction of the lens. For searchlights far better results arose from the outcome of the researches of Mangin who avoided all spherical aberration of reflection from a spherical mirror by using a concavo-convex lens bringing the light rays from the glass into the air almost free of deviation from parallelism, the divergence being practically negligible providing the diameter of the mirror is no greater than its focal length. In practice Sautter, Lemonier and Company constructed an apparatus on these principles in 1876, though the mirror reflected (by its effective angle of about 60 degrees) but a small part of the light from the source. The Sautter-Harlé firm has made great improvements since. Schuckert of Nuremberg, in 1886, produced parabolic mirrors from a single piece of glass using a process patented by him and Munker, and they excelled all others for searchlight purposes. The significant rule is that the intensity of a searchlight is *directly proportional to the area of the mirror and to the intrinsic brilliancy of the source of light*. The advantage claimed for the Mangin mirror is that though the zone illuminated has a smaller diameter than the parabolic, the illumination is greater.

The uses to which searchlights are applied have been chiefly of a military or naval character, and are specially constructed for such purpose as field activities; on land fortifications; at naval stations and in coast defense; on battleships, etc. With the successful practice of aerial navigation the searchlight became a necessary weapon of defense in anti-aircraft service. The searchlight finds frequent useful work in the merchant marine in avoiding collision, during fog, also in the navigation of narrow or tortuous rivers.

In modern searchlights the usual essential features entering into their construction are (1) The body with its mirror, lamp and carbon-adjusting gear, and the front glass. (2) Turntable with arms carrying the trunnions that support the body and handgear for turning and tilting the body. (3) Base mounted on ball-bearings and supports for slip rings. In recent

SEARCHLIGHT

The projector is mounted on a turntable and is electrically operated so that it may be swung on both a horizontal and vertical axis, the movement being controlled from a distance of 500 feet. The arm is raised by a mechanism operated from a power take-off from the driving shaft of the chassis. It is provided with safety devices, controls, etc. It operates rapidly and throws a powerful light for a distance of many miles.

years searchlights utilize the arc lamp as the source of light. In these the carbons are placed horizontally and within the principal focal axis of the mirror or reflector. The positive carbon is adjusted at the front end of the projector and the negative carbon, which is of smaller diameter, next to the mirror. The lighting power required, according to evidence of recent experts, would appear to be that emanating from the *incandescent crater* not the *luminous flux* caused by the flame or the incandescent point of the negative carbon (see *ARC LIGHT*). Searchlight arcs range from 25 and 30 amperes up to 200, or perhaps 250 amperes when used on fortification in coast defense work. Mirrors of recent use are of silvered glass or gilded metal. In military or naval usage the light beam is masked by a louvre mechanism or by flashing shutters which inhibit any passage of light. Searchlights are of two kinds actually, those with concentrated beam and those with dispersed beam. The latter is especially useful for illumination of water where mines are planted, etc.

Improvements in the essential features of the arc for searchlights during a number of years were not noteworthy, though changes in the measurements of the films have increased the available light rays slightly. The greater advance has been made in producing a more steady light, increasing the current per lamp. But the increased current enforces larger reflectors to obtain greater luminosity, the limit having practically been reached already. But the use of a cored carbon for the positive electrode invented (1910) by Heinrich Beck of Meiningen allows an increased brilliancy of the crater causing 300 per cent greater luminosity. The Elmer A. Sperry development of several years ago was also an advance somewhat on the Beck lines. In advancing the capabilities of the carriage and elevating mechanism for portable searchlights much inventive genius has also been expended. The Strauss portable searchlight apparatus type used in the United States Coast Artillery, as illustrated here, affords a good diagrammatic exposition of the land service searchlight and its equipment. This outfit makes its own power, travels at the rate of 15 miles an hour and carries a powerful 36-inch projector which can be raised 22 feet. In battle the projector can be controlled electrically by operators 500 feet away from the apparatus.

SEARCY, sār'sē, Ark., town and county-seat of White County, 50 miles northeast of Little Rock, on the Missouri and North Arkansas, the Rock Island and other railroads. It is the seat of Galloway Female College, contains a courthouse, city hall and Federal building and both public and high schools. It has three banking institutions and manufactories of staves, spokes and felloes, an oil mill and an ice plant. The value of its taxable property is about \$1,000,000. Pop. 4,000.

SEARING, Laura Catherine Redden ("HOWARD GLYNDON"), American author: b. Somerset, Md., 9 Feb. 1840. At 10 she lost the power of hearing and of speech through illness, and was educated at the Missouri Institute for Deaf-Mutes. Later she largely regained the faculty of speech at Clark Institution, Northampton, Mass. She was married to Ed-

ward W. Searing in 1876. Her literary career began when she was 18, and during the Civil War she was a newspaper correspondent at Washington. In 1866-67 she was in Italy as correspondent for the *New York Times* and also engaged in literary work for the Department of Agriculture. During the Franco-Prussian War she wrote 'German War Gossip' for the *New York Tribune*, was on the staff of the *New York Mail* in 1868-76, and in 1886 removed to California, where she has continued writing for the leading periodicals. She has published 'Notable Men in the House of Representatives' (1864); 'Idyls of Battle' (1864); 'Sounds from Secret Chambers' (1874); 'El Dorado,' poems (1897); translations from French of 'A Little Boy's Story,' etc.

SEARLE, sērl, George Mary, American clergyman and astronomer: b. London, England, 27 June 1839. He came to the United States in 1840; was educated at Brookline High School and at Harvard University, being graduated at the latter institution in 1857. He was computer for the *Nautical Almanac* in 1857 and assistant at the Dudley Observatory, Albany, N. Y., in 1858-59. In 1859-62 he was engaged as computer in the United States Coast and Geodetic Survey and in 1862-64 was assistant professor of mathematics at the United States Naval Academy. In 1866-68 Mr. Searle was assistant at the Harvard Observatory. He entered the Paulist order in 1868 and was ordained in 1871. In 1895-97 he was professor of mathematics at the Catholic University, Washington, D. C.; in 1904-10 was superior-general of the Paulist Fathers; in 1910-11 was engaged in astronomical observations, particularly relative to Halley's Comet, at Newman Hall, University of California. In 1911-15 Father Searle was stationed at Saint Mary's Church, San Francisco, and since 1915 at the Apostolic Mission House, Brookland, Washington, D. C. He is Fellow of the Association for the Advancement of Science and member of the American Academy of Arts and Sciences, the American Mathematical Society, etc. He has published 'Elements of Geometry' (1877); 'Plain Facts for Fair Minds' (1895); 'How to Become a Catholic' (1905); 'The Truth about Christian Science' (1916), and contributions to periodicals.

SEARS, Barnas, American theologian and educator: b. Sandisfield, Mass., 19 Nov. 1802; d. Saratoga Springs, N. Y., 6 July 1880. He was graduated at Brown University in 1825 and later studied at Newton Theological Seminary. He was professor at Hamilton Literary and Theological Institute (now Colgate University) 1831-33, and afterward studied in Germany, where he assisted in establishing Baptist missions. He was professor and, later, president of Newton Theological Seminary; and in 1855-67 he was president of Brown University. He was general agent of the Peabody Educational Fund from 1867 until his death. For some years he edited the *Christian Review*. Author of 'The Life of Luther' (1850); and several textbooks and translations.

SEARS, Edmund Hamilton, American Unitarian clergyman and poet: b. Sandisfield, Mass., 1810; d. Weston, Mass., 14 Jan. 1876. He was graduated at Union College in 1834 and at Harvard Divinity School in 1837. He was

pastor at Wayland, Mass., in 1839-40; at Lancaster, Mass., in 1840-47; editor of the *Monthly Religious Magazine* in 1847-65; and after 1865 was pastor at Weston, Mass. Author of 'Regeneration' (1853); 'Pictures of the Olden Time' (1857); 'Christian Lyrics' (1860); 'The Fourth Gospel: the Heart of Christ' (1872), etc.

SEARS, sērz, Isaac, American patriot: b. Norwalk, Conn., 1729; d. Canton, China, 28 Oct. 1786. He descended from Richard Sears, who emigrated from Colchester, England, in 1630, and settled in Massachusetts. He was in command of a privateer against the French in 1758-61, and after losing his vessel settled in New York and engaged in the West Indian and European trade. He became a prominent member of the "Sons of Liberty," and was chairman of the first committee of correspondence established in New York. He commanded the troop that raided the printing establishment of James Rivington, editor of the *Royal Gazette*. After destroying the presses, the types were carried away to be cast into bullets. He was a member of the provincial congress in 1783, and also of the State assembly of New York. Having lost his fortune, he shipped as supercargo on a merchant vessel and contracted a fever on the voyage to China, from which he died.

SEARS, Joseph Hamblen, American author and publisher: b. Boston, 1865. He was graduated from Harvard in 1889, and has since published 'The Governments of the World Today' (1893); 'Fur and Feather Tales' (1897); 'None But the Brave' (1902); 'A Box of Matches' (1904).

SEARS, Lorenzo, American rhetorician: b. Scarsville, Mass., 18 April 1838; d. 1 March 1916. He was graduated from Yale in 1861, from the General Theological Seminary, New York, in 1864, and was engaged in pastoral duties in New England in 1864-85. He was appointed to the chair of rhetoric and English literature at the University of Vermont in 1885, which he filled until 1890, when he occupied that of rhetoric and American literature at Brown University until 1906. He has published 'History of Oratory' (1896); 'The Occasional Address, Its Literature and Composition' (1897); 'Principles and Methods of Literary Criticism' (1898); 'American Literature in the Colonial and National Periods' (1902); 'Seven Natural Laws of Literary Composition' (1904); 'Makers of American Literature' (1904); 'Wendell Phillips, Orator and Agitator' (1909); 'John Hancock, the Picturesque Patriot' (1912); 'John Hay, Author and Statesman' (1914).

SEARS, Taber, American artist: b. Boston, Mass., 1870. He was educated at the Boston Museum of Fine Arts, School of Arts and at the Julien Academy, Paris, and studied under Jean Paul Laurens and Luc Olivier in Paris, as well as studying at Rome and Florence. He has specialized in mural paintings and in designs for stained glass windows. His mural paintings include 'The Spirit of Niagara' (Buffalo Historical Society); 'Among the Nations' (New York city hall); frieze of the Apostles (Epiphany Church, Pittsburgh), etc.

SEARSPORT, Me., town on Penobscot Bay, five miles northeast of Belfast, and about 30 miles southwest of Bangor. Its chief industries are shipbuilding, ice-gathering, shipping hay and lumber and poultry products. It has lumber and grist mills and a spool mill. It has a high school, graded elementary schools and the Sears Public Library, opened in 1872. The national bank has a capital of \$50,000; the savings bank has a large amount of deposits. Pop. 1,444.

SEAS, Freedom of, a term of international law and diplomacy employed to describe the legal nature of the high seas, in respect to the right of every nation to navigate their waters freely beyond a certain limit, usually three miles from the coast, without being subject to the control of any nation. This freedom, now so well established, was not universally recognized in earlier times. As late as the 15th century Portugal asserted sovereignty over the Indian Ocean, and a large part of the Atlantic Ocean south of Morocco, while Spain asserted an equal right over the Pacific and the Gulf of Mexico, and the Pope supported their claims. In later times Great Britain asserted extravagant claims over the English Channel and certain great arms of the sea which washed the shores of the British Isles. Still later other nations, from time to time, asserted more or less jurisdiction over certain waters of the open seas. Thus the United States recently undertook to exclude other nations from killing fur seals in the Bering Sea many hundreds of miles from the American coast, but the question having been submitted to an international tribunal of arbitration, the tribunal decided against the American claims. Even now some nations claim and exercise jurisdiction in respect to fisheries and revenues over their littorals extending far beyond the three-mile limit, and although this assertion has occasionally produced irritation and conflict it has usually been acquiesced in. Formerly also certain nations claimed and exercised the right to control great bodies of the open sea connected by straits within their jurisdiction. The claims asserted by Denmark over the Baltic Sea were a well-known instance, and her claims were not finally abandoned until the middle of the 19th century. Grotius in his 'Mare Liberum' published in 1609 in answer to Selden's attack upon the freedom of the seas revived the doctrine of the Roman law that there could be no property in anything which could not be effectually occupied; hence the oceans were free to the navigation of all, subject to the control of no nation. Since Grotius' time the general principle of the freedom of the seas in time of peace has been universally recognized and except for the depredations of pirates and slave traders it has been generally enjoyed for purposes of navigation. This, of course, does not mean that a nation cannot restrict the maritime trade between its own continental ports or between itself and its colonies to its own citizens and to vessels flying its own flag, or that it cannot prescribe conditions under which foreign ships may enter or depart from its own ports. What freedom of the seas in time of peace means is the right of the ships of all nations to navigate freely the high seas outside the ter-

ritorial waters and beyond the three-mile marginal sea without being subject to the right of search or molestation by the vessels or authorities of any nation.

In time of war no such freedom of navigation is recognized. This freedom is limited by the admitted right of belligerents to intercept and confiscate articles of contraband on their way to the enemy and to prevent by means of lawful blockade all intercourse or trade in any and all goods, whether contraband or not, with the enemy. To this end, the public vessels of a belligerent may stop and search on the high seas any neutral vessel with a view to ascertaining its nationality as well as the character and destination of its cargo and, under certain conditions, both may be confiscated or even destroyed. During the late war certain belligerents, notably Great Britain, went to the length of taking neutral vessels into distant ports for the purpose of conducting the searches, against all of which neutral governments vigorously protested. Mails from neutral steamers were likewise taken in, searched, censored and detained. Many neutral vessels were also stopped and persons of enemy nationality were taken off and imprisoned. Mines were sown in the open seas, first by Germany and then by Great Britain, and a goodly number of neutral merchant vessels innocently navigating the high seas were destroyed. Germany, and to a less extent Great Britain, also declared great areas of the open seas to be war zones, "barred zones," "danger areas" and the like (see WAR ZONES). The zones proclaimed by Great Britain could only be navigated with great danger and the Germans even went to the length of deliberately sinking all ships which entered the zones proclaimed by their government. In the enforcement of their blockade measures Great Britain and France applied the doctrine of continuous voyage or ultimate destination to trade with the enemy through neutral ports and thus effectually, it was charged, blockaded neutral ports. The doctrine of contraband was extended to include nearly everything that could be carried by sea, the distinction between conditional and absolute contraband was abolished and the rule of ultimate destination was applied to both classes of contraband without distinction (see CONTRABAND). The German government went even further and systematically sunk many hundreds of neutral vessels, including even fishing vessels, hospital ships and those engaged in missions of mercy and philanthropy, in spite of the immunity which international law assures them. By these and other acts the principle of the freedom of the seas, as it has been heretofore understood, was seriously infringed upon and loud protests were made by neutrals. The German government likewise never ceased to denounce the conduct of Great Britain and maintained that it was fighting for the freedom of the seas—a profession which in virtue of its own lawless conduct was more hypocritical than sincere.

While the United States was still a neutral the President denounced these infringements upon the freedom of the seas, and in an address to the Senate declared that the "paths of the sea must alike in law and in fact be free" and that "the freedom of the sea is the *sine*

quá non of peace, equality and co-operation." As one of the 14 conditions of peace which he announced to Congress on 8 Jan. 1918 was the following: "Absolute freedom of navigation upon the seas, outside territorial waters, alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants." It was pointed out at the time that the seas were already free in time of peace and his proposal must, therefore, apply only to the freedom of the seas in time of war. There was a difference of opinion as to the exact meaning of the proposal for "absolute" freedom of navigation and it was the subject of much discussion. Literally interpreted it would mean the abolition of the belligerent right of blockade, at least of commercial blockade, the right to seize contraband of war going to the enemy, the surrender of the right to prevent unneutral service and perhaps of the right to capture enemy private property at sea and to destroy enemy merchant vessels. Great Britain and France in their replies to the President's proposals accordingly stated that since the point relating to the freedom of the seas was "open to various interpretations," some of which they could not accept, they must, therefore, "reserve to themselves complete freedom on the subject when they enter the peace conference." It is obvious that a freedom of the seas which would deprive a belligerent of these weapons would amount in effect to a prohibition of naval warfare altogether and would place a naval power in a position of great disadvantage in comparison with a military power. It is well known that the exercise of these rights contributed more than anything else to the defeat of the Confederacy during the Civil War and it is doubtful whether without them the Allies could have forced Germany into submission during the late war. There seems little likelihood, therefore, that the great naval powers, including the United States, will be willing to pay such a price for an absolute freedom of the seas. Much may be said and has been said in favor of the immunity of private property from capture at sea and even in favor of the abolition of purely commercial blockades. The British government even went to the length of proposing at the second Hague Conference that contraband be entirely abolished and that neutrals be allowed to carry without molestation what they will to belligerents, and this proposal received the support of 26 states. But as yet no agreement has been reached and it does not seem likely that as to some of the proposals any agreement will be reached in the near future. As the term is now understood, therefore, freedom of the seas in time of war means nothing more than the liberty of neutrals to trade with belligerents subject to the long-established restrictions in respect to blockade and contraband. To be sure, these restrictions should be more precisely defined and limited so as to prevent in the future such grave infringements as were committed upon the rights of neutrals during the late war. As to the rights of belligerents to sow mines in the open seas beyond their territorial waters, to assert control over great areas of the sea under the name of "war

zones," and to destroy systematically and generally neutral merchant vessels, they should be forbidden altogether. These measures would not ensure "absolute" freedom of the seas but they would remove the most irritating sources of controversy, which is probably all that can be expected for the present. S., 'Freedom of the Land and Freedom of the Seas' (*Yale Law Journal*, Vol. XXVIII, p. 151); Hays, A. G., 'What is Meant by Freedom of the Seas' (*American Journal of International Law*, Vol. XII, p. 283); Anderson, C. P., 'Freedom of the Seas' (in *Annals of the American Academy of Political and Social Science*, July 1917).

JAMES W. GARNER,

Professor of Political Science, University of Illinois.

SEASHORE, Carl Emil, American psychologist: b. Mörlunda, Sweden, 28 Jan. 1866. He was graduated at Gustavus Adolphus College in 1891 and from Yale University in 1895. He was assistant in the Psychological Laboratory at Yale in 1895-97; and from 1897 was associated with the faculty at the University of Iowa, where he has been professor of psychology since 1902, head of the department of philosophy and psychology since 1905 and dean of the Graduate School since 1908. He invented many psychological instruments, among them being the voice tunoscope, spark chronoscope, pyscherogograph, audiometer, sound perimeter and multiple recorder. He is editor of the University of Iowa's *Studies in Psychology*; joint editor of the *Journal of Educational Psychology*; and consulting editor of the *Psychological Review*. Author of 'Elementary Experiments in Psychology' (1908); 'Psychology in Daily Life' (1913); 'The Psychology of Talent' (1917), etc.

SEASICKNESS, an affection attended with nausea and other disagreeable sensations produced by the motion of a vessel. Its causes and etiology are as yet imperfectly understood. Some refer it to causes dependent upon the altered or affected functions of the nervous centres; others to the regurgitation of bile into the stomach; and still others to irritation of the liver by the unusual movements of the body, increased secretion of bile being secondary. Probably each of these views contains something of the real explanation of the disorder.

When a landsman goes to sea, the movements of the ship, and the shifting lines and surfaces, unsettle his visual stability, as the different inclinations of the plank he stands on unsettle his muscular sense. The consequent derangement of these faculties reacts upon the nervous centres and through the latter upon the viscera, thus producing nausea and vomiting. Recollection of the disturbing sensations, together with the emotional state which they originally excited, may itself become an efficient cause, at least in individuals, of peculiarly irritable stomachs, or of highly sensitive nervous systems; for this plays downward upon the sensorial centres in such a manner as to excite in them the same condition as that which was originally produced through the medium of the

sensory nerve. This may explain why certain individuals show all the symptoms of seasickness on going aboard a vessel perfectly at rest. So, no doubt, imagination is a potent and important factor in the case. The fact that visual impressions predispose travelers to seasickness suggests that a susceptible individual, when on deck, should shut the eyes.

But perhaps the chief causes of seasickness may be summed up thus: (1) Effusion of blood to the brain; (2) disturbance of the digestive system; (3) over-eating, and also under-eating. Many preventive measures referring to the construction and arrangement of vessels have been tried with little success; yet experiments with vessels having a swinging saloon, designed to preserve equilibrium in any sea, and vessels with a breadth intended to minimize the rocking motion, show that nautical men and shipbuilders are becoming alive to the interests and comfort of travelers. Preventive measures regarded from the patient's point of view are practically limited to the regulation of diet before a voyage. The diet for some days previously should be plentiful, but of light and nutritious character. Above all, the bowels should not be constipated and food should not be taken for at least five or six hours before going on board, although a cup of strong coffee just before embarking will prove beneficial as a slight stimulant. On the ship a position as near the centre as practicable is to be preferred. It is best when lying down to lie on the back, with the head and shoulders very slightly elevated. As a comforting measure during the attack of nausea and vomiting, some form of alcohol and ice in small doses has been recommended. A bandage moderately tight, across the pit of the stomach, or an ice-belt or even cold compresses all along the spine may afford relief; while some are benefited by sipping frequent drafts of lukewarm or cold water, though a glass of hot milk may be better. The presence of any harmless fluid in the stomach tends at least to prevent the disagreeable sensations of retching. Three or four drops of chloroform on lump-sugar may prevent vomiting and a suitable dose of bromide of soda and antipyrine will often give further relief. Many medical men consider that if drugs must be taken, the best all-around remedy is chlorobrom (not chloroform), a compound of chloralamide and bromide of potassium, while some prefer five grains of bromide of ammonia.

SEASONS, the four grand divisions of the year. Spring is from the vernal equinox, when the sun enters Aries, to the summer solstice; summer is from the summer solstice to the autumnal equinox; autumn is from the autumnal equinox to the winter solstice; winter is from the winter solstice to the vernal equinox. The earth's axis is inclined to the plane of the ecliptic at 66½ degrees, and as the earth moves round the sun in the course of a year, the northern hemisphere is turned to the sun in summer (most so at the summer solstice); at the equinoxes the line of light and shade on the earth passes through the poles, and at the winter solstice the northern hemisphere is turned from the sun. It is evident that the characters of the seasons are reversed to inhabitants of the southern hemisphere. See AUTUMN; EARTH; SUMMER; SPRING; WINTER, etc.

SEASONS, The, a poem in blank verse by James Thomson (q.v.), which has been characterized as "the classic of descriptive poetry." The evolution of the poem is traced in 'Winter,' published in 1726; 'Summer,' 1727; 'Spring,' 1728; and 'Autumn,' 1730. In 1744 the poet issued a new edition with extensive additions and alterations as 'The Seasons.' Departing from the severe classic style of Pope and his school, Thomson relied solely on an appeal to the external beauties of nature, and by simplicity and truthfulness inaugurated a new era in English poetry which gathered strength in Gray and Cowper and culminated in Wordsworth. Not only in England was he imitated by his contemporaries, notably by Goldsmith in 'The Deserted Village,' but numerous translations appeared on the continent of Europe, while in 'Les Saisons,' Saint-Lambert (1716-1803) copied Thomson in a poem praised by Voltaire, and which was popular for half a century.

SEATON, Sir John Colborne, 1st Baron of. See SIR JOHN COLBORNE.

SEATON, William Winston, American journalist: b. King, William County, Va., 11 Jan. 1785; d. Washington, D. C., 16 June 1866. He engaged in journalism at 18 and edited various newspapers until 1812 when he became associated with his brother-in-law, Joseph Sales, Jr., with whom he was editor and owner of the *National Intelligencer* at Washington. From 1860, until just prior to his death, he was sole editor and manager. In 1812-20 Seaton and Gales were exclusive Congressional reporters, one attending the sessions of each house. Their publications are highly authoritative and of great historical value. They include 'Annals of Congress, Debates and Proceedings of the Congress of the United States from 3 March 1798, till 27 May 1824' (42 vols., 1834-56); 'Register of Debates in Congress from 1824-37' (29 vols., 1827-37); 'American State Papers' (21 vols., 1832-34). Consult the 'Life' by his daughter (1871).

SEATTLE, Wash., largest city of Pacific Northwest, county-seat of King County, and a seaport important in coastwise, Alaska and Oriental trade, is situated between Puget Sound on the west and Lake Washington on the east; 865 miles by water north of San Francisco, Cal., 185 miles by rail north of Portland, Ore., 123 miles by rail south of Canadian boundary. The city area (1919) is 94.47 square miles, of which 35.91 square miles are water.

Location.—Seattle has a beautiful natural setting with the snow-capped Olympic Mountains and Puget Sound on the west, while on the east are Lake Washington and the Cascade peaks, including Mount Baker (10,730 feet) and Mount Rainier (14,408 feet). Lake Washington, 22 miles long, four miles wide, 225 feet maximum depth and a shore line of 80 miles, has been recently connected with Puget Sound by a ship canal more than eight miles long, built by local and State appropriations. The canal, 150 feet wide and 36 feet depth of water, joins lake and sound through Lake Union, in the heart of the city, two miles long by three-quarters of a mile wide. The level of Lake Washington and Lake Union is the same, while one set of locks (cost to United States

government, \$2,275,000) connects the fresh waters of the latter with the salt waters of Puget Sound. These locks have one chamber 80 × 825 feet in dimensions and another 30 × 100 feet, with a depth of water from 36 to 42 feet. The larger chamber requires 25 minutes and the smaller 15 minutes to pass a ship through. The canal, opened in July 1916, has extended Seattle's waterfront area from 40 to 140 miles, adding a fresh water, non-tidal harbor, unique in the world. At the south end of Elliott Bay another artificial waterway has recently been completed by the straightening of the Duwamish River through local appropriations. The Duwamish waterway, five miles long, 300 feet wide and 30 feet deep at low tide, taps a level district rapidly coming to the front as a manufacturing section.

The general contour of Seattle is hilly, ranging from sea-level to 500 feet on the West Seattle crest. Queen Anne Hill, a prominent residence district, is 464 feet high. The valleys have a north and south trend and the prominent hills include Beacon Hill, First Hill, Renton Hill, Capitol Hill, Queen Anne Hill and Madrona Hill. Cable lines running east and west serve the higher hills direct, while the electric lines follow winding routes to the various parts of the city. Regrading in recent years has torn down some of the hills which obstructed business and has filled in the hollows creating a level area. More than 34,000,000 cubic yards of earth have been removed, largely by the hydraulic process, and hills 130 feet high have been leveled. While business houses occupy the lower, level areas, the general residence districts are on the slopes possessing perfect drainage and a wealth of sunshine, fresh air and scenery. In addition to Lake Union and Lake Washington there is in the north central part of the city adjoining Woodland Park, a small lake about a mile long and half a mile wide. The waters of these lakes are clear and pure and do not freeze as the average winter climate in Seattle is 40° above zero.

Climate.—The equable temperature of the Puget Sound region, ranging from 40° to 64° (the high summer average) is due to the effect of the Japan current and has much to do with Seattle being the healthiest city in the world. The death rate in 1918 was 6.80 per 1,000. The city has the best of water, sewers, pavements and sidewalks. Seattle has no extremes of heat, cold, floods, nor drought (annual rainfall, 29.2 inches in 1918). There are 622 miles of watermains; 495 miles of sewers; 282 miles of paved streets.

Banks.—There are 31 banks with deposits in 1918 of \$168,093,101 and clearances of \$1,859,964,752.

Communications.—The terminus of several transcontinental railroads, Seattle is reached by the Great Northern, Northern Pacific, Chicago, Milwaukee and Saint Paul and Union Pacific (Oregon-Washington) railroad companies over their own rails, while through transcontinental trains are operated by the Canadian Pacific (over Northern Pacific tracks), the Chicago, Burlington and Quincy (over Northern Pacific tracks), and the Southern Pacific (over Oregon-Washington tracks). There is a short line local railroad—the Columbia and Puget Sound. The Grand Trunk Pacific and Canadian Pacific operate their steamships from Canadian

terminals at Prince Rupert, British Columbia, and Vancouver, British Columbia, respectively, to the Grand Trunk and Central Pacific railroad docks in Seattle. The several important steamship lines having their headquarters in Seattle give the most frequent service to Alaska of any Pacific Coast port, thus supplementing Seattle's geographical position as the natural trade gateway to the North country. The Alaska Railroad Commission, building a government line from Seward to Fairbanks, has its office in Seattle. Practically all the gold from Alaska and the Yukon Territory is received here and the United States Assay Office established in 1898 has since received about \$265,000,000 worth of gold. Among the leading Alaska steamship lines operating freight and passenger vessels from Seattle are the Alaska Steamship Company, the Pacific Alaska Navigation Company, the Pacific Coast Steamship Company, the Humboldt Steamship Company, the Northland Steamship Company, the Border Line Transportation Company, the Westward Navigation Company, the Canadian Pacific and Grand Trunk Pacific. Many of these companies also operate coastwise to California ports and utilize the Panama Canal to reach Atlantic Coast ports. Being 1,250 miles nearer Oriental ports by the Great Circle Route than by any of the steamship lines operating from California, Seattle is naturally an important figure in the Far Eastern trade. Great liners operate from this city to Japan, China, Siberia, Hawaii, the Philippines, Straits Settlements, Australia, Mexico, South America, Europe, and, in fact, to every part of the world. Seattle is both the commercial and industrial centre of the Puget Sound Customs District, which leads every other district on the Coast in value of imports and exports. In 1918 the net tonnage of vessels entering Elliott Bay, Seattle's Harbor, was 20,418,247 tons. The foreign exports in 1918 (harbormaster's report) totaled \$212,501,489; foreign imports, \$368,306,395. Seattle has a large fleet of steamers owned locally and operating to ports on Puget Sound and adjacent waters. A fleet of steamers operates with freight and passengers on Lake Washington. The total water-borne commerce of Seattle in 1918 (including foreign, coastwise and local) was valued at \$792,120,736. Leading articles of export included wheat, flour, lumber, fish, coal (from mines in vicinity of Seattle), hay, fruit, livestock, dairy products and general merchandize, a large part of which is produced in the vicinity of Seattle or in Washington. The leading imports were silk, rice, tea, coffee, sugar, spices, indigo, curios and Oriental products of various kinds.

Public Buildings.—Seattle has more than 300 churches, including Chinese, Japanese, Finnish, Jewish, Scandinavian, German and Russian, and is the See of the Roman Catholic bishopric of Seattle (formerly Nesqually). Among the attractive religious edifices are Saint James Cathedral, First Baptist Church, First Church of Christ Scientist and First Presbyterian Church, the last-named seating 3,000 in the main auditorium. Among the other buildings worthy of note are the following: 42-story L. C. Smith Building (highest office building outside of New York City), the cost

of which was \$1,500,000; Metropolitan Building (White-Henry-Stuart), cost \$1,500,000; Providence Hospital, cost \$1,000,000; Washington Hotel, cost \$970,000 (with ground and furnishings, \$1,500,000); Hoge Building, \$700,000; Alaska Building, \$700,000; Cobb Building, \$600,000; City and County Building; Carnegie Library, Oregon-Washington and Union depots, Arctic Club, Sunset Club and Rainier Club. Among the leading theatre buildings are the Metropolitan, Moore, Pantages and Orpheum.

Industrial Activities.—The cheap water and hydro-electric power obtainable in Seattle have aided in making it the most important manufacturing, as well as commercial city of the Pacific Northwest. The municipal electric plant represents an investment of \$6,660,000. Seattle is said to be among the best lighted cities in the world. Private power in large quantities is also sold at rates from one-half cent per kilowatt hour up by the Puget Sound Traction, Light and Power Company. The 1918 industrial census showed 1,811 industries in Seattle, an increase of 588 plants over 1909, or a percentage of 57.4. Among the important industries are the following: flour, \$15,000,000; lumber products of the State of Washington, \$120,000,000; canned salmon and preserved fish handled at Seattle, \$80,000,000. The shipbuilding industry is also of great and increasing magnitude in Seattle.

Parks, Recreation Centres, etc.—The parks and boulevards are unusually complete for a city of the age and size of Seattle. There are 1,815 acres under the jurisdiction of the park commissioners, including 44 improved parks and 24 equipped and supervised playgrounds. Connecting the thickly forested parks in the various parts of the city by winding drives with easy gradients, now skirting the Lake Washington shore or overlooking the waters of Puget Sound and the mountains, the scenic boulevard system of 31 miles within the city limits is one of the most attractive in the United States. It will be 50 miles long when fully completed, practically encircling the city and touching all the more sightly elevations. The sum of \$5,089,606 has been spent on park extensions and improvements. These figures include the pavilion and bathing facilities at the municipal beach at Alki Point and the municipal golf links at Jefferson Park. Other improved parks include Seward (198 acres) on Lake Washington; Woodland (179 acres) adjoining Green Lake in the north part of the city and embracing the zoological department, athletic field, recreation and picnic grounds, boating, bathing, fishing and concert facilities; Ravenna Park, including Sulphur and Mineral Springs, immense trees, water falls and natural ravine; Washington Park, a large tract of natural wood bordering Union Bay of Lake Washington, and containing city speedway; Volunteer Park on Capitol Hill overlooking both Lake Washington and Puget Sound has statue of William Henry Seward by Richard Brooks, Municipal Conservatory filled with exquisite blooms the year 'round, formal gardens, concert facilities, and a public observatory 460 feet above sea-level; Alaska-Pacific-Yukon Exposition Grounds on University of Washington Campus containing formal gardens; Schmitz

SEATTLE, WASHINGTON

Totem Pole in Pioneer Square

Park, a beautiful natural park on West Seattle Peninsula with ravines, lakes and big trees; Kinnear Park on Queen Anne Hill with formal improvements and marine view; Madrona Park on Madrona Hill overlooking Lake Washington and Mount Rainier, with winding walks, pagodas, swings and tennis courts; Denny Blaine, Mount Baker, Leschi and Atlantic, smaller lake-side parks surrounded by home districts; Frink, Cowan, Denny and Salmon Bay parks in the midst of residences. Among the leading playgrounds are Lincoln, Walla Walla, Collins, Beacon, Rogers, South Park, Day, Columbia, Miller, Rainier Beach, Ballard, University, West Seattle, Alki, Queen Anne, Mercer and Ross, all fully equipped with modern apparatus and many with adult instructors and supervisors. Wading pools and sand piles are provided in addition to tennis, baseball, cricket, football and other facilities. Elaborate field houses equipped with gymnasium apparatus, stages for amateur plays and recreation rooms have been erected at a total cost of \$75,000 in the following playfields: Collins (\$25,000); South Park (\$20,000); Ballard (\$15,000); West Seattle (\$15,000). There are 20 equipped playfields and four additional playground sites are unimproved. Among the largest of several open spaces in the business district is Pioneer Place where the famous Totem Pole stands and where the park commissioners have constructed an underground public comfort station to accommodate 12,000 persons daily. Other stations are located at Pike Place market, Public Library, Sixth avenue and Westlake and similar popular portions of the business district. In addition to the municipal amusement places there are private amusement parks, including Luna Park and Golden Gardens, both located on Puget Sound; Fortuna and other parks on Lake Washington. The links of the Seattle Golf and Country Club are north of Seattle and of the Earlington Golf and Country Club north of the city.

The University of Washington has a golf links on its campus of 355 acres within the city limits.

Education.—The university (established here by legislature of 1854-55) is rapidly advancing to leadership on the Pacific Coast. It has 6,000 students, 310 professors and instructors with several permanent buildings of beauty valued at \$1,200,000. On the campus is a statue of George Washington by Lorado Taft and a bust of James J. Hill by Finn Frolich. The Museum, Forestry Building and open air auditorium are of interest to strangers. The grounds of Fort Lawton (605 acres given by Seattle to the Federal government) are in the northwest part of the city overlooking Puget Sound. The navy yard, Puget Sound, located at Bremerton about 15 miles west by south of Seattle, is protected by Fort Ward and has one of the two largest dry docks in the United States navy,—863 feet long and 110 feet wide. It also has a dry dock 627 feet long and 39 feet deep. The yard is equipped at government expense for building battleships and as the result of its natural advantages promises to be one of the largest in the country.

The public schools of Seattle are of an excellent standard including six high schools, 72 grade schools, 50,000 pupils and 1,010 teachers. The high schools are of the latest type with gymnasium, domestic science and nor-

mal school equipment and cost as follows: Franklin (Mount Baker district), \$426,000; Broadway, \$425,000; Lincoln (Green Lake), \$386,000; Ballard, \$330,000; Queen Anne, \$253,000; Jefferson (West Seattle), \$250,000. In addition to the University of Washington, Seattle has the Washington Preparatory School for Girls, Academy of the Holy Name, College of Our Lady of Lourdes, Adelpia College, Seattle College, Brothers School for Boys, numerous business colleges, dramatic schools and conservatories. The Parental School for unruly children is located on Mercer Island in the southeastern part of Lake Washington.

Libraries.—The city library system has about 314,000 volumes in the Carnegie Library and nine branches with 70,167 borrowers, a circulation of 1,336,143, and buildings and grounds worth \$1,100,000.

Public Monuments.—Among the statues in the business area in recognition of his services to the State and in making possible the Lake Washington Canal construction, as well as other community endeavors, is one of the late Governor John H. McGraw, by Richard Brooks, at Times square on Westlake avenue. Other works of art in Seattle include statues and paintings owned by the Washington State Art Association with exhibition galleries in the White Building, and including the following: Bronze statue, 'Diana and Endymion,' by Ernst Dame, standing in 'Totem Gardens' at Fifth avenue and University street; bronze statue, 'Mercury in Repose,' duplicate of one taken from ruins of Herculaneum and now in National museum at Naples, Italy; portrait of Henry Yesler, a Seattle pioneer, by J. Carroll Beckwith, of New York; oil painting (9×9 feet), 'Jesus in the Tomb,' by Henry Levy; oil painting, 'Dorset, Vermont,' by the late Frederick Crane; oil paintings of Alaskan scenery, by Leonard Davis. The association owns the Tozier Collection of Indian Relics and Curios, the most complete record of the art of Alaskan Indians in existence. This includes baskets, implements used in hunting and daily life, ivories, and carved black jade, and remarkable totem carvings, some of the totem poles being on display in 'Totem Gardens' at Fifth and University.

Charitable and Correctional Institutions.

—A charities endorsement committee created (1903) is operated by the Seattle Chamber of Commerce and Commercial Club. There is a Charities Organization Society, a charities commission appointed by the county board of commissioners, a receiving home for children (1896) under the Washington Children's Home Society; Seattle Children's home (1884) under the Ladies' Relief Society of Washington; Children's Orthopedic Hospital (1907); Girls Home and Training School (1909) under the auspices of the Seattle Federation of Women's Clubs; Kenny Home for elderly men and women under the auspices of the Presbyterian Church; Seamen's Home under Seattle branch of American Seamen's Friend Society; Firland Anti-Tuberculosis Institution built and operated by the city; Anti-Tuberculosis League of King County (1909), treatment in homes and special hospitals; Florence Crittenden Home, branch of the National Crittenden Mission; Lebanon Rescue Home for fallen girls; Japanese Women's Home; Volun-

teers of America; Salvation Army; Young Men's Christian Association; Young Women's Christian Association; Red Cross Society, a branch of the National organization; Humane Society of Seattle; Seattle Fruit and Flower Mission; House of the Good Shepherd (Sisters of the Good Shepherd); Mount Carmel Mission and Columbus Sanitarium and (Missionary Sisters of the Sacred Heart); Catholic Social Betterment League; Ladies' Hebrew Benevolent Society; Ladies' Montefiore Aid Society; Hebrew Benevolent Association; Hebrew Immigration Aid Society; Seattle Day Nursery; John Walter Ackerson Home; and the Pacific Coast Rescue and Protective Association. The Seattle Foundation was recently organized as a clearing house for charities and beneficences. The principal hospitals are: Providence Hospital (1877), under the Sisters of Charity; Seattle General Hospital (1894); Wayside Emergency (1900); Minor Hospital; Swedish Hospital; Pacific Hospital; Municipal Hospital, under control of city; County Hospital, under control of county commissioners. The county has platted its former poor farm property in the city limits into industrial sites, having rail and salt water transportation, and is leasing them to new industries. The commissioners have bought a county farm of 407 acres at a cost of \$113,000 to house the indigent.

Societies for Civic Betterment.—Among the civic organizations working for community advancement is the Seattle Chamber of Commerce and Commercial Club, the oldest organization of the kind in the city and now including industrial, publicity, conventions, taxation, transportations, foreign and domestic commerce, Alaska charities and exhibits bureaus. Other semi-public organizations include the Manufacturers Association, Merchants Exchange and Washington State Art Association, in addition to numerous business and educational bodies, technical and local improvement clubs. Leading social clubs include the Rainier, Arctic, University, College and Seattle Athletic organizations for men and the Sunset and Women's college clubs for women. Musical organizations include the Amphion Society, Symphony Orchestra, the Northwest Musical Festival Association, which gives a week's festival in July each year, and several conservatories and colleges of music. The Y. M. C. A. and Y. W. C. A. own their buildings.

Street Railways.—The street car lines purchased by the city from the Puget Sound Traction, Light and Power Company cover 260 miles, besides two municipally owned lines, one entirely in the city and the other operating partly within and outside the city limits. The Puget Sound Traction, Light and Power Company also operates interurban lines to Tacoma and Everett, while the Seattle, Renton and Southern operates an interurban line to Renton. The city of Seattle conducts its own garbage collection, disposing of same by incinerators and sanitary fills.

Public Markets.—The ferries are of special service to the farmers and ranchers in the vicinity of Puget Sound, enabling them to convey easily and economically their produce to the public markets for which Seattle is noted and which contribute to the low cost of living in this city. There are municipally or privately owned market places in various parts of the

business districts where the growers, fishermen and other producers sell direct to the housewife, insuring fresh foods and low prices.

Other Features.—Seattle is the headquarters of the Immigration Service of the Pacific Northwest and the United States Detention Station is located here. Canadian immigration and customs officials are also established at this port. The centre of the Northwest good roads movement, Seattle is the terminus of the Savannah to Seattle Transcontinental Highway, on the Pacific Highway from Canada to Mexico, prominent on the National Parks Transcontinental Highway as the gateway to Rainier National Park, as well as the famous Sunset Highway through Snoqualmie Pass (3,010 feet) in the Cascade Mountains, and also on the Georgian Circuit which includes the Olympic Peninsula and British Columbia highways. The headquarters for the 13th Division of the United States Railway Mail Service are located here.

Water Supply.—Seattle's municipal water system is valued at \$11,000,000 and has a daily capacity of 62,500,000 gallons with a daily consumption of about 33,000,000 gallons. There are 48,000 accounts on the department's books and 9,000 hydrants supplied by 704 miles of pipe line. The city's storage capacity is 271,137,000 gallons, conveyed by two pipe lines, aggregating 62.64 miles, from the watershed in the Cascade Mountains, 28 miles from Seattle. The rates are low and the water is cold, sparkling, and almost as soft and pure as distilled water.

Newspapers, Periodicals, etc.—The city has many publications, including daily newspapers, weekly newspapers, social, professional, trade and technical publications and monthly magazines. There are Japanese, Swedish and German newspapers here. The principal newspapers are the *Post-Intelligencer*, daily and Sunday (1867); *Times*, daily and Sunday (1881); *Star*, daily (1899); *Union Record*, daily (1918).

Government.—The city government consists of a mayor elected biennially, a council of nine elected at large, three annually for three-year terms, treasurer, comptroller and corporation counsel and the following departments: city engineer's, public utilities, water, streets, building, lighting, police, fire, civil service, health, parks and library. The harbor master's department in charge of the port warden keeps the harbor clear of floating logs and the menaces to navigation. The port commission, established in 1911 and consisting of three members elected for three years, is a county body and has spent about \$10,000,000 in harbor terminals, including special docks for lumber, grain, with bulk elevators, cold storage and other equipment. The port operates a ferry to West Seattle, and one across Lake Washington, while the county operates a ferry on Lake Washington to Vashon Island on Puget Sound, and to Harper, Kitsap County.

History.—Seattle, named for Sealth, a friendly Siwash Indian chief, was settled in 1852, the first settlers landing at a point now within the city limits which they called New York Alki, the latter word meaning in Siwash "By and by." The town (population 300) withstood an Indian uprising in 1856, was incorporated in 1865 and reincorporated as a city in 1869. In 1884, the first railway reached Seattle

SEAWEEDS

1. Gulf-weed (*Sargassum vulgare*)
2. Dead-Men's-Fingers (*Laminaria digitata*)
3. Wing-weed (*Laminaria sacculata*)
4. Bladder-weed (*Macrocystis pyrifera*)
5. Comb-weed (*Pocanum coccineum*)
6. Coral-moss (*Coralina officinalis*)
7. Horn-tangle (*Ceramium rubrum*)
8. Red-weed (*Polysiphonia urceolata*)
9. Rib-weed (*Delesseria sanguinea*)
10. Irish Moss (*Chondrus crispus*)
11. Hide-weed (*Schizymenia edulis*)
12. Sea-lettuce (*Ulva latissima*)
13. Cladophora gomerata
14. Chandelier-weed (*Nitella flexilis*)
15. Chandelier-weed (*Chara fragilis*)

after the entire citizenship had wielded pick and shovel to build a line threatening to connect with the Canadian Pacific. Anti-Chinese riots in 1885 were quelled by a local vigilance committee. A disastrous fire in 1889 destroyed the business district causing a \$7,000,000 loss. Pledges of contributions by Seattle to the Johnstown flood sufferers went forward in the face of the disaster. The indomitable Seattleites soon rebuilt better than before. The financial panic of 1893 retarded Seattle's growth but the first shipment of Alaska gold in 1897 gave new impetus to her forward movement, which has not since been halted. In 1909, from 1 June to 15 October, an exposition on the University of Washington Campus was attended by about 4,000,000 people and upon its close turned over to the university 19 buildings of various sizes for college purposes. To start construction of the exposition, representing an expenditure of \$10,000,000, Seattle citizens subscribed in one day more than \$600,000 in stock and the project was entirely financed by city and State without Federal assistance (except as an exhibition). The exposition was unique in being completely ready on the opening day and closing with all debts paid.

Population.—(1870) 1,107; (1880), 3,533; (1890) 42,837; (1900) 80,671; (1910) 237,194; (1918) estimate 380,000. In 1910, more than one-quarter of this population (61,134) were of foreign or mixed percentage, including 9,850 English Canadians; 8,676 Swedes; 7,191 Norwegians; 6,172 Germans; 6,127 Japanese; 5,797 English; 3,176 Irish; 1,879 Danes; 1,298 Finns and 924 Chinese.

Publicity Director, Chamber of Commerce.

SEaweeds, the simpler kinds of plants which grow in the water. The term is restricted to the lower plants, and does not include the aquatic kinds of mosses, liverworts, fernworts, and flowering plants. (See *ALGÆ*). Originally the term was applied exclusively to the plants which live in the seas and oceans, but these are now called "marine seaweeds" to distinguish them from the "fresh-water seaweeds" which grow in rivers, lakes, and ponds. The simplest of all plants, the blue-green slimes (*Cyanophyceæ*) are the lowest of the seaweeds. They occur mostly in fresh waters; some, however, are marine. The green seaweeds (*Chlorophyceæ*) are of considerably higher organization, the cells being distinctly nucleolated, and possessing well defined chromatophores, in which the green coloring matter resides. They include such single-celled types as the common green slimes (*Protococcus*), desmids, diatoms, the filamentous pondscums, green felts (*Vaucheria*), as well as some larger leaf-like and massive kinds (*Ulva*, *Caulerpa*, *Codium*, etc.). They occur abundantly in both fresh and salt waters throughout the world.

The brown seaweeds (*Phæophyceæ*) are closely related to the green seaweeds, and differ from them mainly in having an additional brown coloring matter which hides the green

color of the chromatophores. The simplest forms are minute few-celled plants, others are branching filaments, while still others are large, massive plants many feet in length, and composed of root, stem and leaves. In all the mode of reproduction is of a simple type, showing their low grade in spite of the great size of some of the species. Among the larger plants of this group are the kelps (*Macrocystis*, *Lessonia*, etc.), devil's aprons (*Laminaria*) and rockweeds (*Fucus*). Some Pacific species of the first-named genus attain a length of several hundred feet, and are doubtless the longest plants in the world. Nearly all brown seaweeds are marine, a few only living in fresh waters. The red seaweeds (*Rhodophyceæ*) are by far the most beautiful and interesting of aquatic plants. They are of a higher organization than those of the preceding groups. A few are composed of simple slender filaments, but they are more commonly multicellular stems, with roots below, and leaf-like or finely divided branches above. Although they are green plants, having well-developed chromatophores in their cells, they have in addition a reddish or purplish coloring matter which hides the green color. This often gives them a beautiful color, which, added to their delicate and regular branches, makes them exceedingly attractive objects of study. They are commonly collected by seaside visitors, under the name of "seamosses." A few species live in fresh waters, all the others being marine. Some species are edible, as notably the so-called "Irish moss" (*Chondrus crispus*), of the Atlantic Coast of America and Europe, from which is made the delicacy known as *blanc mange*. The highest of the seaweeds are the stoneworts (*Characeæ*), which resemble some of the red seaweeds, but are of a green color, the red coloring matter not being developed in them.

SEawell, sē'wēl, Molly Elliot, American novelist and playwright: b. Gloucester County, Va., about 1868; d. Washington, D. C., 15 Nov. 1916. After the death of her father, a nephew of President Tyler, Miss Seawell and her mother removed to Washington, D. C., where she began writing stories and sketches in 1886. Her first signed story was 'Maid Marian,' which was subsequently dramatized. The next offering of Miss Seawell was 'Throckmorton' (1890). It met with success as did 'Children of Destiny,' which followed it in 1893. A prize of \$500 offered by the *Youth's Companion* for a study of boys presented a new field for conquest. She won the prize over 3,000 competitors with 'Little Jarvis.' So great was the popularity of the story that it was made the first of a series entitled 'Young Heroes of Our Navy.' The succeeding volumes—'Decatur and Somers,' 'Midshipman Paulding' and 'Paul Jones' were written by Miss Seawell, and maintained the success won by the first. In 1895 her 'Sprightly Romance of Marsac' won a prize of \$3,000 offered by the *New York Herald* for the best novelette. In 1900 she dramatized the story. In 1908 she won another *Herald* prize for a short story with 'John Mainwaring, Financier.' Miss Seawell's other stories include 'Twelve Naval Captains'; 'The Rock of the Lion'; 'The Imprisoned Midshipman'; 'The Lost Duchess of Belgrade'; 'The Secret of Toni'; 'The House of Egremont'; 'Papa Bouchard'; 'Garvin Hamilton'; 'A

Strange, Sad Comedy'; 'The Victory'; 'The Chateau of Monplaisir'; 'The Marriage of Theodora'; 'A Virginia Cavalier'; 'The Jugglers'; 'The Lover of the Lady Arabella'; 'History of the Lady Betty Stair'; 'Franczka'; 'Fifi'; 'The Ladies' Battle,' and 'The Diary of a Beauty.' Miss Seawell was identified prominently with the anti-suffragist movement in Washington.

SEBACEOUS GLANDS, small structures of glandular nature and sacculated form which exist in the substance of the corium, or deep layer of the dermis or true skin. They are very generally distributed over the entire skin-surface, but are most numerous in the face and scalp. Those of the nose are of large size, and may frequently become enlarged from the accumulated secretion of the glands; while the largest in the body are the sebaceous glands of the eyelids, the Meibomian glands (see EYE). Around the orifices of the mouth and anus, nose and external ear, these glands are found in numerous array; but they appear to be absent from the skin of the palms of the hands and soles of the feet. Each sebaceous gland consists essentially of a lobulated or sac-like structure opening by a single efferent duct. The wall of the sac, as well as that of the duct, is lined by cells of cubical epithelium. These cells secrete the sebaceous matter which is chiefly fat, which collects in the gland, the cells becoming transformed into the secretion and breaking down in the process. The separate sacculi, or little pouch-like divisions which make up each gland, may vary in number from 2 or 5 to 20. As a general rule the ducts of the sebaceous glands open into the hair-follicles, or sac-like involutions of the skin which surround and enclose the roots of hairs. But in many cases the ducts open simply on the external surface of the skin. There are generally two sebaceous glands in connection with each hair. A curious little parasitic mite, harmless in its nature — the *Demodex folliculorum* — is frequently found inhabiting the sebaceous ducts of the nose, especially when their secretion is pent up. This little organism is not known to occur elsewhere.

The sebaceous glands are first developed in the sixth month of embryonic life, and appear in their earliest condition as sac-like appendages to the hair-follicles. The secreting cells, containing fat particles, appear in the centre of the developing gland; these cells gradually enlarge and, escaping by the root or attached portion of the sac, constitute the first secretion of the gland. The functions of the sebaceous secretion are chiefly those of keeping the skin moist and from being cracked by the influence of heat and of the air. Friction between skin surfaces is also diminished in the same manner by the sebaceous secretion. The secretion is present in greatest amount in those races which inhabit warm climates and are greatly exposed to the sun's heat. Pimples and boils are the most frequent types of inflammation of the sebaceous glands. See HAIR; SKIN.

SEBAGO (sě-bā'gō) **SALMON**, the land-locked salmon of Sebago Lake, Maine, and a few neighboring inland waters, which has lately been widely distributed through fish-cultural operations. It was long regarded as a mere land-locked variety of the Atlantic salmon, but Jordan and Evermann consider it entitled to

rank as a species (*Salmo sebago*) distinct from that and from the Ouananiche (q.v.). In Sebago Lake it averages about 10 pounds in weight. Its habits are like those of the typical species with such modifications as the physical differences between the ocean and lake make necessary. "In Sebago Lake in the fall, structural and chromatic changes occur, and it ascends tributary streams to spawn. After this function is performed it returns to the lake, which is its ocean, and resorts to deep water. In the spring as soon as the ice breaks up, when smelts, upon which it extensively feeds, are running up the streams to spawn, the salmon follow them." Consult Jordan and Evermann, 'Food and Game Fishes' (New York 1903), and American angling authorities generally.

SEBASTIAN, sě-bās'tī-an, **Saint**, a saint of the Roman Catholic calendar: b. Narbonne, Gaul, toward the middle of the 3d century; d. Rome, 20 Jan. 288. His position as captain in the Prætorian Guard at Rome gave him many opportunities of spreading Christianity, and protecting its adherents; but he was finally arrested and carried before Diocletian. The emperor ordered him to be shot to death by archers. A Christian woman named Irene, finding him still alive, drew out the arrows, took him home, and nursed him till he recovered. He then presented himself before Diocletian, and remonstrated with him for his cruelty; whereupon the emperor ordered him to be beaten to death, and his body to be thrown into the common sewer, whence it was taken by another Christian woman, called Lucina, who buried it at the feet of the apostles, Peter and Paul. In the 9th century his relics were carried to Soissons, whence they were dispersed through France, Spain, Germany and the Netherlands. A church was erected to this saint by Pope Damasus. Saint Sebastian is invoked against the plague, and is considered the patron saint of marksmen. His day is the 20th of January. There are many pictures of this saint by the Italian and other painters. He is generally represented as a beautiful youth tied to a tree and transfixed by arrows. The most famous pictures of his martyrdom are those by Luini, Bassi, Mantegna, Holbein, Paul Veronese and Ribera. In the cathedral at Lucca the subject has been treated in sculpture by M. Civitali.

SEBASTIAN, Dom, king of Portugal: b. 1554, d. 1578. He was the posthumous son of the Infant John by Joanna, daughter of Charles V, and ascended the throne in 1557, at the death of his grandfather, John III. During his minority the government was conducted by his great uncle, Cardinal Henry, brother of Emanuel the Great. He was educated by his guardian, Catharine of Austria, wife of John III (sister of Charles V). He was imbued with religious enthusiasm and a chivalrous desire to undertake a crusade. His constant dream was the conversion of Asia and Africa to Christianity, and the subjection of these continents to Portugal. At 20 he made an expedition to Ceuta, Tangier and Magazar, the only possessions that remained to the Portuguese from former conquests in Africa. From these places he suddenly fell upon the unsuspecting inhabitants and although no material results ensued, his lust for conquest became more con-

firm. Soon afterward (1578) a war of succession broke out in the kingdom of Fez and Morocco. Mulei Malek, the youngest son of the last emir, had, contrary to his father's will, been excluded from the throne, but with foreign aid had finally succeeded in conquering his hereditary kingdom, and compelling his nephew, Mulei Mohammed, who had usurped it, to flee. The latter sought aid from Sebastian, who yielded to the request, hoping to effect something for Christianity and the fame of Portugal. In spite of the admonitions of his counselors, he equipped a fleet and an army, part of which he had collected in Spain, Germany and Italy, and sailed for Africa, 24 June 1578. The expedition reached Tangier in safety, but at Alcazarquivir was met by the far more numerous host of Mulei. Here on 4 Aug. 1578, a decisive battle was fought, in which Sebastian was completely defeated. Almost all his followers, including the best of his nobility, were either slain or taken prisoners, and he himself was among the missing. A corpse supposed to be the king's was found, but it was disfigured with so many wounds that identification was impossible. His death in consequence remained doubtful and gave occasion to the rise of several pretenders, the most notable of whom appeared in Venice 20 years afterward, and, after various vicissitudes, succeeded in arousing the sympathy of all Europe. Faith in his pretensions eventually subsided and he lapsed into obscurity. Consult D'Antas, Miguel, 'Les faux Don Sebastien' (1865).

SEBASTIANO DEL PIOMBO, sã-bãs-tẽ-ã'nõ dẽl pẽ-õm'bõ. See PIOMBO, SEBASTIANO DEL.

SEBASTOPOL, sẽ-bãs'tõ-põl or sẽb-ãs-tõ'-põl, or **SEVASTOPOL** (Russ. sã-vãs-tõ'poly), Russia, in the government of Taurida, an important seaport in the southeast of the Crimea, on a harbor famed for its excellence—an inlet of the Black Sea, four and one-half miles long, one-half mile wide at the mouth and one mile wide further inland, afterward averaging one-half mile across. Depth from three to 11 fathoms. It is enclosed by high limestone ridges, and is accessible to the largest ships. The river Tchernaya enters the harbor at the east. The principal part of the town occupies a slope between South Bay or Dockyard Harbor, and Quarantine Bay. Prior to the destruction of the town (1854-55) it was solidly built; the forts were marvelous strongholds mounted by 700 guns and the docks were among its most important works. The dock basin was supplied with water by a canal from the Tchernaya. The town was almost unprotected on the interior side, however, but the temporary defenses erected by General Todleben, during the Crimean War (the most formidable of which were the works of Malakoff and Redan) have since that time become celebrated. These works were, however, at last captured, at the end of a memorable siege by the allied French and English forces, the Russians retiring after the town had been ruined. The French and English engineers then blew up the docks and forts, which, by the Paris treaty (1856), were not to be rebuilt. These restrictions were annulled in 1871 by the London conference. The docks and forts were restored by the Russian government in 1885, and Sebastopol is now again the

naval port for the Black Sea fleet. The town was bombarded by the Turks in the great European War. The town has been partially rebuilt—it was once an important commercial port, but Kaffa (q.v.) has taken its place since 1899, in this regard. The value of imports entering this port was formerly over \$5,000,000; of exports, \$15,000,000. Sebastopol was founded on the site of Akhtiar in 1783, by Catharine II. Many historical reminiscences render this an interesting spot. The promontory where the town now stands was once occupied by the temple where Iphigenia, daughter of Agamemnon, officiated as priestess. Later, Greeks colonized the promontory, but were overcome by the Genoese, who established themselves at Balaclava. The ruins of the Genoese castles are still to be seen. Pop. about 77,000.

SEBILLOT, sã-bẽ-yõ, Paul, French folklorist: b. Malignon, France, 6 Feb. 1846. He was educated at the communal college of Dinan, studied law at Rennes, and established himself in Paris as a notary, but soon abandoned the law for art. From 1870-83 he exhibited about 20 pictures at the Salon, but his travels through Saint-Brieuc, Pont-Aven, and various out-of-the-way sections of Brittany aroused an interest in folklore, and he gradually drifted from art to the study of folklore, on which he wrote a series of excellent books. He succeeded to Henri Martin's seat in the commission for Megalithic Monuments, became *chef du cabinet* at the ministry of public works, and in 1889 chevalier of the Legion of Honor. From its foundation in 1885 he was editor of the *Revue des traditions populaires*. His works include 'Contes populaires de la Haute-Bretagne' (3 series, 1880-81-82); 'Légendes, croyances, et superstitions de la mer' (2 vols., 1886-87); 'Littérature orale de l'Auvergne' (1898); 'Le folklore des pêcheurs' (1901); 'La mer fleurie le rivage Marius et corsaires' (1903); 'Le folklore de France' (1904-07); 'Le folklore, littérature orale et ethnographie traditionnelle' (1913).

SEBORUCCO, a narrow bench of coral rock margining a large part of the coast of Cuba. It is mostly a few yards wide and elevated about 15 feet above the sea. It is due to fringing coral reef raised by a general uplift of the island.

SECALE, in botany, rye, a genus of the *Triandria Digynia* class and order, in the natural order of *Gramina* or grasses. Essential character, calyx opposite, two-valved, two-flowered, solitary. There are four species; the villosum, orientale, creticum and cereale. Secale villosum or wood-rye grass is distinguished by a calyx with wedge-shaped scales, and by the fringe of the glume being woolly. The glumes of the secale orientale are shaggy and the scales of the calyx are shaped like an awl. The glumes of the secale creticum are fringed on the outside. The secale cereale or common rye has glumes with rough fringes. There are two varieties, winter and spring rye. The winter rye, which is larger in the grain than the spring rye, is sown in the autumn, at the same time with wheat, and sometimes mixed with it; but as the rye ripens sooner than the wheat, this method is exceptionable. The spring rye is sown along with oats, and usually ripens as soon as the

winter rye; but the grain produced is lighter and it is therefore seldom sown. See RYE.

SECAUCUS, N. J., borough in Hudson County, two miles north of Jersey City, on the Lackawanna Railroad. There are manufactures of chemicals and pearl buttons, and the town has large power houses. Pop. 4,740.

SECCHI, sĕk'kĕ, **Angelo**, Italian astronomer: b. Reggion nell', Emilia, 29 June 1818; d. Rome, 26 Feb. 1878. He entered the order of the Jesuits in 1833, and after teaching in various Jesuit colleges, including Georgetown University, Washington, D. C., he was in 1849 appointed professor of astronomy and director of the observatory at the Collegio Romano. When the Jesuits were expelled from Italy in 1870 he was permitted to retain his position. Father Secchi's services to astronomy were of the utmost value. He made a careful study of the physical constitution of the sun, the nature of sun-spots, and the solar prominences, but of much greater importance was his pioneer work, carried out with less perfect instruments contemporaneously with that of Huggins in stellar spectroscopy or astrophysics. He made the first systematic spectroscopic survey of the heavens and proposed a classification of stellar spectra under four main types, which has proved a valuable basis for subsequent research. Among his works are 'Catalogo delle Stelle di cui si è determinato lo Spettro luminoso' (1867); 'L'Unità delle Forze fisiche' (1869); 'Le Soleil' (1870); 'Le Stelle' (1877). Consult Pohle, 'Angelo Secchi' (1883).

SECESSION, the act of withdrawing from, a term of great political importance, especially in the history of the United States. Whenever a State has claimed the right to withdraw from the Union, it has based its claim on the doctrine of State sovereignty. This claim must be considered as emphatically distinct from the right of revolution, insurrection or violent revolts, in all of which there is no claim technically of legal right, and the appeal of which is to force instead of reason. Nearly every State of the Union, in its turn, has advanced the right of secession and usually each has been condemned by the others as treasonable. This claim was specifically brought forward or involved in the Kentucky "Resolutions," the Hartford "Convention," and the "Nullification Ordinance" (qq.v.). The election of Abraham Lincoln to the Presidency of the United States in 1860, when the political situation was flanked with sectional differences resting on State claims, was all that was necessary to change the theory of secession in the South into an attempt to effect the reality. South Carolina took the lead. No single State was prepared or willing to secede alone, but Florida, Mississippi and Alabama agreed to secede with any other State. Again South Carolina was leader in calling a State convention and on 20 Dec. 1860 the Act of 1788, ratifying the National Constitution, was repealed and it was declared "that the union now subsisting between South Carolina and other States, under the name of the United States of America, is hereby dissolved." A declaration of the causes for this act was formulated and was adopted on the 24th. The governor proclaimed "the secession of South Carolina" the same day. Mississippi was the first to follow this example, 9 January 1861; then in succession came Florida,

10 January; Alabama, 11 January; Georgia, 19 January; Louisiana, 26 January; and Texas, 1 February, though in the case of this last State the proceedings were irregular. Virginia followed in April; Arkansas and North Carolina in May and Tennessee in June. The Civil War was the consequence and its final issue was the victory of the Union government and the full federation of the United States of America. See SECESSION IN THE UNITED STATES; UNITED STATES — SECESSION; CIVIL WAR.

SECESSION CHURCH, in Scotch ecclesiastical history, a religious body which withdrew from the Established Church of Scotland in 1733, when several preachers were ejected in consequence of their opposition to the law of patronage. The ejected ministers formed themselves into an ecclesiastical court, under the name of the "Associated Presbytery," and published an act, declaration and testimony to the doctrine, worship, government and discipline of the Church of Scotland. In 1747 a division arose among the seceders respecting the legality of the burgh oath, in which burghesses profess "the true religion professed within the realm." Those who asserted the lawfulness of the oath were called burghers, those who condemned it anti-burghers. In 1820 they were reunited as "The Associated Synod of the Secession Church," several congregations of each party, however, refusing to accede to it. In 1847 the Associated Synod, joining with the Relief, constituted the United Presbyterian Church. See PRESBYTERIANISM; SCOTLAND.

SECESSION IN THE UNITED STATES. To properly understand the causes which led to the secession of the Southern States in 1861 and the reasons which actuated those by whom such action was advocated, we must confine our investigations to the history of the country and the conditions which existed prior to the dates when the seceding States withdrew from the Union. If we look back from the standpoint of to-day the events of over half a century intervene and we see but little of the picture which was presented at that period. We must study the theory of the Constitution as it was understood and explained by the creators of that instrument, and the history of the period prior to 1861, at least so far as it relates to constitutional rights and construction. It will also be interesting and instructive to consider the views entertained by the advocates of the State Rights doctrine as distinguished from the views of the extreme nationalists, and we must also become informed regarding the long-continued struggle between the leaders of these two parties. In 1860 not only the leaders but the Southern people generally were firm in the belief that a State had the legal right to secede from the Federal Union. This was the natural result of the teachings of more than half a century. Whatever opposition existed in the several State conventions or among the people of the seceding States arose not on the question of the principle of secession, the right to secede, but upon the expediency of seceding. Perhaps the most conspicuous example of the unity of the people of the seceding States is to be found in the proceedings of the Alabama Convention. A very large minority of this convention, for a while supposed to be a majority, was elected on the following platform: "That we hold it

to be our duty, *first*, to use all honorable exertions to *secure* our rights in the Union, and if we should fail in this, we *will maintain* our rights *out of the Union*; for, as citizens of Alabama, we owe our allegiance first to the State; and we will support her in whatever course she may adopt."

With rare exceptions the arguments against such action were on the ground that it was inexpedient and inadvisable, but when the act was consummated it was generally recognized in the seceded States as the supreme law of the land, the exceptions being for the most part confined to a few counties in East Tennessee and the sparsely inhabited strip of mountain land known as the southwestern part of the Alleghanies. In this connection it is important to state that in 1861 and for years prior to that time this belief in the right of secession was by no means confined to the South, or to the so-called pro-slavery party. Horace Greeley, editor of the *New York Tribune*, was outspoken in upholding the right of secession, and for months after the establishment of the Confederate government army officers from the South openly discussed the question of remaining in the Union army or joining the Confederacy, and those who decided upon the latter course were allowed to go freely.

General Joseph E. Johnston and Col. Robert E. Lee both continued in the performance of their army duties in Washington for nearly two months after the inauguration of President Lincoln, the former holding the all-important position of quartermaster-general of the army of the United States; and it was after it was generally known that Colonel, afterward General, Lee had decided that it was his duty to give his fealty to his native State, Virginia, that Mr. Lincoln offered him the appointment as commander-in-chief of all the armies of the United States. At that time the authorities in Washington did not use the words treason and traitors in referring to the Southern officers who resigned their commissions and joined the Confederate army. But the results of the appeal to arms whereby the advocates of secession were overwhelmed have clouded and caused to be utterly forgotten the legal and logical principles for which the States Rights party had contended for three-quarters of a century.

Greeley said in 1860: "War is a hideous necessity at best, and a civil conflict, a war of estranged and embittered fellow countrymen, is the most hideous of all wars." (*New York Tribune*, 16 Nov. 1860). And his words were prophetic. In the terrible internecine war of four years more than 1,000,000 human beings, most of whom were the youth of the land, fell in battle or succumbed to disease and the hardships of campaign, or were wounded and maimed; while in nearly every home, North and South, heartbroken mourners were crushed by the awful sacrifice to the God of Battles. During and at the close of the war every branch of the government was under the control of those responsible for the coercive policy which brought it on. With rare exceptions the whole press of the Northern States and its literature were dominated by the same influences. The chief executive and all his subordinates in the government with one acclaim pronounced the edict that those who had not supported their views should be made odious to the American

people, and from that time the teaching to the youth of the land has been of this character. The causes which influenced the action of those who brought about the secession of the Southern States became utterly obscured and forgotten.

Causes of Secession.—The general assumption that slavery was the sole cause of secession and the war that followed is very far from correct. It is clearly to be seen that far away and beyond the question of slavery, even in the very earliest days of the life of the nation, the two parties began the struggle—the one to maintain the unrelinquished rights of the States, the other to establish and vest greater power in the central government. But although this leading question, and other cognate questions were really at issue in this conflict, slavery was the proximate occasion of the Civil War. The anti-slavery agitation focused and brought into active operation the theories of the extreme nationalists that the central government had the right to go into the domain of State governments and regulate their domestic affairs. And the threats of the abolitionists awoke the Southern people to the realization that the guarantees of the Constitution for the protection of slave property were to be nullified and, at least to that extent, the rights of the States destroyed. It is, therefore, necessary to review the history of this contributing, if not paramount, cause, without entering upon any discussion of the question of slavery itself.

History of Slavery.—Slavery was not only a heritage from the mother country, but the history of early colonial times shows that it was a forced heritage that was resisted and opposed by the colonies. In the same spirit the Southern people opposed slavery at the time of the Declaration of Independence and were vigorous in resisting the further importation of slaves from Africa. The wise men of that day foresaw the evils attending such a traffic. Its enormous profits would cause a further great influx of people hardly removed from savagery. But when slavery became a fixed institution, recognized, guaranteed and protected by the Constitution, the people of the South sought to ameliorate, so far as possible, all the evils attending it. Slavery was part of the common law of England prior to the settlement of the first colonies in America, and became the common law of the colonies; and at the time of the Declaration of Independence existed in each of the 13 colonies. As above stated, this condition existed despite the efforts of some of the colonies to terminate it. Judge Cooley in his continuation of Story's 'Commentaries on the Constitution,' says: "No colony was so persistent in its efforts to check the [slave] trade as Virginia, and Judge Tucker enumerates 23 acts on the subject, beginning with 1699." Georgia, under Oglethorpe, prohibited the importation of slaves until 1752, when the proprietors surrendered the charter and the colony became part of the royal government, when the power of the colonists to prevent the importation of slaves ceased, the Crown prohibiting the exercise of any such power by the colonists. In 1760 South Carolina passed an act prohibiting the further importation of African slaves. The act was rejected by the Crown; the governor was reprimanded; and a circular was sent to all the governors of the

colonies warning them against presuming to countenance such legislation.

England not only considered the slave trade beneficial, and fostered and protected it, but had actually inaugurated and established it. Its first appearance in history is in the grant of a charter by Queen Elizabeth to a company formed to supply African slaves to the Spanish-American colonies—the queen herself being a shareholder in the company. In 9th and 10th William III an act was passed reciting that “the trade was highly beneficial and advantageous to the kingdom.” In 1708 the House of Commons resolved: “That the trade was important, and ought to be free and open to all the queen’s subjects trading from Great Britain.” And as late as 1775 the Earl of Dartmouth, in answer to a remonstrance from the agent of the colonies, said: “We cannot allow the colonies to check or discourage in any degree a traffic so beneficial to the nation.” And so popular was this traffic that slaves were openly sold in the public squares of London. Thus were the efforts of the colonies, led by Virginia, Georgia, Maryland and South Carolina, to put an end to the traffic, thwarted by the greed of the traders in the mother country.

The first African slaves imported into America were landed by a Dutch trading vessel at Jamestown in 1620, and from that time the traffic became general throughout all the colonies. Pecuniary profit to the traders and the need of the negro as a laborer was not the only incentive to this traffic. The press and even the pulpit contended that it was humane and Christian to bring these heathen savage negroes to the protective care of civilized people. Slaves were imported in large numbers into New England until it became apparent that they were not fitted to the rigorous climate of the North. Importation to the northern colonies and States gradually diminished and finally ceased, but New England shipowners continued for many years to be actively engaged in the business of importing and selling slaves. Notwithstanding the reasons in favor of this business the leaders of thought among the Southern colonists continued to fight against the traffic, and Jefferson, in his first draft of the Declaration of Independence, brought forth, as one of the counts in his indictment of the king, “this cruel war against human nature itself . . . this piratical warfare,” and charged that the king had “prostituted his negative for suppressing every legislative attempt to prohibit or to restrain this execrable commerce” in order to keep open a market for the sale of human beings. Jefferson gave, among other reasons for omitting this clause from the final draft of the Declaration: “Our Northern brethren also, I believe, felt a little tender under those censures; for, although their people had very few slaves, yet they had been pretty considerable carriers of them to others.” This traffic against which the colonies had waged war for a century continued to exist at the time of the Declaration of Independence; and when the Constitution was adopted slavery existed in every colony with the possible exception of Massachusetts, where in 1781, not by legislative enactment, but by a decision of the Supreme Court of that colony, it was declared inconsistent with the declaration of the Bill of Rights that “all men are born free and equal.”

The framers of the Constitution (q.v.) real-

ized the sensitive and delicate nature of the question of slavery, and wisely left it untouched except to protect the property rights of the slaveholders and to give to Congress the power to prohibit the importation of slaves after a certain date. The third paragraph of section 2 of Article IV of the Constitution provided that “no person held to service or labor in one State, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered upon claim of the party to whom such service or labor may be due.” Under this clause Congress passed the Fugitive Slave Law (q.v.) of 1793. The first paragraph of section 9 of Article I of the Constitution provided: “The migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by Congress prior to the year one thousand eight hundred and eight, but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person.”

The history of the adoption of this clause sheds much light upon the attitude of the Southern slaveholders. The first draft provided: “No tax or duty shall be laid, etc., on the migration or importation of such persons as the several States shall think proper to admit; nor shall such migration or importation be prohibited.” South Carolina and Georgia insisted that the freedom of importation should be limited, and insisted upon a limitation as a condition of the Union; and the clause limiting until 1808 the prohibition against Congress of preventing such importation was finally adopted.

During the period from 1787 to 1808 the question of prohibiting the importation of slaves was entirely under the control of the States, and every Southern State which had not already done so enacted laws prohibiting further importation of slaves. Jefferson’s earnestness in opposing the traffic has already been noticed, and Virginia was the first State to prohibit it. Georgia was the first State to incorporate such a prohibition in the Constitution. Henry Laurens of South Carolina writing to his son, 14 Aug. 1776, said: “You know, my dear son, I abhor slavery. I was born in a country where slavery had been established by British kings and parliaments, as by the laws of that country, ages before my existence. . . . Not less than 20,000 pounds sterling, would all my negroes produce, if sold at public auction to-morrow. I am not the man who enslaved them; they are indebted to Englishmen for that favor; nevertheless I am advising means for manumitting many of them, and for cutting off the entail of slavery. . . . I perceive the work before me is great.”

Mr. Lowndes of South Carolina, speaking in the House of Representatives on 14 Feb. 1804, of the impossibility of prohibiting the importation of slaves into his State, said: “With navigable rivers running into the heart of it, it was impossible for us, with our means, to prevent our eastern brethren from introducing them (the negroes) into the country. The law was completely evaded.”

In 1807 Congress passed an act prohibiting the importation of slaves into any part of the United States after 1 Jan. 1808. The vote in

the House of Representatives was almost unanimous, being 113 against 5. Of the five who voted against it only three were from the South, one being from the Portsmouth district, New Hampshire, and one from Vermont. Mr. Betton from New Hampshire represented large shipping interests; and that the vote of Mr. Crittenden of Vermont was approved by the people of his State is shown by the fact that he was three times re-elected to Congress, and was subsequently elected governor and judge. This vote shows the absence of any sectional division of sentiment on the subject. In the meantime in 1784 Virginia had ceded to the United States the great Northwest Territory, and in 1787, before the adoption of the Constitution, the Congress had adopted the Ordinance for the Government of the Northwest Territory. This was adopted at the instance of Virginia, and its Sixth Article provided that "there shall be neither slavery nor involuntary servitude in the said Territory, otherwise than in punishment of crimes whereof the party shall have been duly convicted." In December 1805 the legislative council and house of representatives of the Indian Territory petitioned Congress to suspend the operation of the Sixth Article, and petitions of numerous inhabitants of the Territory, together with a letter of William Henry Harrison, governor of the Territory, of the same purport, were forwarded to Congress. These petitions were referred to a committee of seven members consisting of representatives from Virginia, Pennsylvania, Ohio, New York, Kentucky and South Carolina, who reported favorably to the petition, but no final action was taken by Congress. In January 1807 a letter from Governor Harrison enclosing resolutions unanimously adopted by the legislative council and house of representatives of Indiana, petitioning for the suspension of the Sixth Article and for the introduction of slavery, was laid before Congress. The matter was again referred to a committee whose members were drawn from various sections of the country. The committee again reported favorably, the House adopted a resolution suspending the article, but the Senate failed to concur in it and the matter was dropped.

Although the importation of slaves was prohibited the institution of slavery became more firmly intrenched in the slave-holding States, and at the same time a sentiment in favor of its abolition grew stronger in the non-slave-holding States. In 1819 a violent dispute arose between the North and South, the occasion being the proposal to admit Missouri as a State. After a year of bitter controversy a settlement was reached in a compromise whereby Missouri, with a constitution permitting slavery, was admitted, but as to the remaining portion of the territory of the United States lying north of lat. 36° 30' N., it was provided that slavery should be prohibited. In the North the compromise was exceedingly unpopular, and a general movement looking toward the abolition of slavery was commenced. In 1840 and in 1844 the anti-slavery party had Presidential candidates in the field. The annexation of Texas, the war with Mexico and the further acquisition of territory furnished cause for additional controversy. In 1848 the anti-slavery party showed growing strength, and political campaigns took on increasing bit-

terness. The one side depended upon the guarantees of the Constitution to protect its property rights; the other insisted upon their right to prevent the extension of slavery, "while conceding," as Judge Cooley admits, "that the Federal government was powerless to disturb it in the States." During these times of fierce controversy the greatest minds from all sections of the country devoted their efforts to securing peace. Clay, Webster, Cass and Benton met in harmony and by their united efforts secured the compromise of 1850 by which California was admitted as a free State, new States were to be permitted to be carved out of Texas, the slave trade was prohibited in the District of Columbia and new Territories were to be organized without either expressly permitting or prohibiting slavery. But these compromises and all the efforts of the peacemakers were futile. The Missouri Compromise was repealed, the Fugitive Slave Law was nullified in the North, in Kansas armed conflicts occurred between the opposing factions, and in October 1859 John Brown with a band of Northerners made a raid into Virginia in an endeavor to incite the negroes of the South into insurrection, rapine and bloodshed.

The almost unanimous sentiment, North and South, upon the question of re-opening the African slave trade is shown by the vote on the following resolution introduced in the House of Representatives by Mr. Orr of South Carolina, on 15 Dec. 1856: "Resolved, That it is inexpedient, unwise and contrary to the settled policy of the United States, to repeal the laws prohibiting the African slave trade." This resolution was adopted by a vote of 183 to 8, and most of those voting against it explained their votes by stating that no proposition looking to the opening of the slave trade having been presented the resolution was out of place. In 1856 the anti-slavery party had made great progress and came near electing their candidate for President. It was hoped that the decision of the Supreme Court in the Dred Scott case (q.v.) would put an end to the political agitation, but the decision being adverse to the theories of the abolitionists added fuel to the flame. The Supreme Court and the venerable chief justice became objects of the most venomous abuse. In the controversy which now raged, moderation and reason seemed annihilated in the bitterness of feeling. The ablest minds of the North were exercised in constructing arguments to justify the coercive policy. Floods of anti-slavery literature were poured out before the impressionable youth. The pulpit and the lecture hall rang with appeals in which slander and denunciation were the key-notes, and the press took up and echoed their appeals.

While many people in the North were actuated solely by the belief that slavery was a wrong that should be abolished yet it was not until the question became one of national and political importance that the party opposed to the one in power used it as a means to secure control of the government. Like all other questions which become political, misrepresentations of the grossest character were made in order to attain political ends. Therefore, the pictures of slavery as presented to the Northern mind were in marked contrast to actual conditions as seen by those who were surrounded by them. It is true that there were

exceptional cases where there was apparent cruelty, and some cases where the slaves endured real hardships; and these cases were almost exclusively confined to the Mississippi and other alluvial bottom lands where the slaves were removed from the care and protection of their masters and were controlled by overseers, whose sole effort was each year to attain the highest financial results for their employers. But while the cases of hardship were few in number they were seized upon, colored and exaggerated in order to, so far as possible, inflame the Northern mind against the institution. The conditions as they appeared to the Southern people were, with rare exceptions, in marked contrast with the tales spread in the North. The planter of the South, or his ancestors, had seen the most degraded of human beings brought from Africa. Most of them had been, in their native land, slaves of tyrannical and cruel negro masters. They had become the property and in a certain sense members of humane, Christian families. The instincts of humanity and the interests of ownership had combined to lift these negro slaves from the lowest conditions of savagery into a state of civilization, where they were well fed, well clothed, protected and all their physical wants attended to, and furthermore where they were uplifted morally, surrounded by Christian influences and given Christian instruction. While slavery had its evils, history has record of no people who made so rapid an advance from a low condition of savagery and immorality to one of comparative civilization and moral responsibility as was shown by the improvement in the condition of the savage negroes that were brought to this country by the slave-traders. It has been charged that the Southern people took care of their slaves only because they were property and because the loss of a slave was a monetary loss. This charge is unjust in the extreme, and is in line with other calumnies which would deny all humanity to the slaveholding Southerners. The Southern people as a class cared well for their slaves, not only because they were property, but also because there was a real bond of affection between the master and the slave, and between all the members of the master's family and all the slaves in his house or on his plantation. Proof of the real conditions can be found in the following extract from Booker T. Washington's 'Up From Slavery':

One may get the idea, from what I have said, that there was bitter feeling toward the white people on the part of my race, because of the fact that most of the white population was away fighting in a war which would result in keeping the negro in slavery if the South was successful.

In the case of the slaves on our place this was not true, and it was not true of any large portion of the slave population in the South where the negro was treated with anything like decency. During the Civil War one of my young masters was killed, and two were severely wounded. I recall the feeling of sorrow which existed among the slaves when they heard of the death of "Marse Billy." It was no sham sorrow, but real. Some of the slaves had nursed "Marse Billy"; others had played with him when a child. "Marse Billy" had begged for mercy in the case of others when the overseer or master was thrashing them. The sorrow in the slave quarter was only second to that in the "big house." When the two young masters were brought home wounded, the sympathy of the slaves was shown in many ways. They were just as anxious to assist in the nursing as the family relatives of the wounded. Some of the slaves would even beg for the privilege of sitting up at night to nurse their wounded masters. This tenderness and sympathy on the part of those held in bondage was a result of their kindly and generous natures. In order to defend and protect the women

and children who were left on the plantations when the white males went to war, the slaves would have laid down their lives. The slave who was selected to sleep in the "big house" during the absence of the males was considered to have the place of honour. Any one attempting to harm "young mistress" or "old mistress" during the night would have had to cross the dead body of the slave to do so. I do not know how many have noticed it, but I think that it will be found to be true that there are few instances, either in slavery or freedom, in which a member of my race has been known to betray a specific trust.

As a rule, not only did the members of my race entertain no feelings of bitterness against the whites before and during the war, but there are many instances of negroes tenderly caring for their former masters and mistresses.

As a general rule (the exception being in the bottom lands where but few white people lived except the overseers, and where the worst and most untractable negroes were sent) the virtue of the negro women was carefully guarded by the slave-owners, and for several reasons. First, the Southern people were, as they are to-day, essentially religious and, as above stated, took great care of the moral training of the negroes. In most of the small establishments the mistress of the house assumed this as one of her duties, and on most of the large plantations where there were from 100 to 1,000 slaves, a chapel was provided and a minister employed to teach religion and morals. A plantation upon which there were no mulatto children was the more valuable, and conveyed an idea of commendation which attached to all who were connected with it. In the third place marriage and chastity among the slaves were fostered and promoted for property reasons. So far did the Southern people go in protecting the female slaves that regular patrols were organized for the purpose of arresting and punishing the lower class of white men who prowled around at night among the negro cabins. Of course the Southern people were greatly incensed by the gross misrepresentations as to their cruelty and immorality, and believed that the object of these misrepresentations was to arouse a sentiment which would lead to the attempt of the Northern people, acting through the national government, to interfere with the right of self-government guaranteed by the Constitution, and to deprive them of their property. And the feelings of resentment which naturally followed widened the breach day by day, month by month and year by year; until it became apparent that only a cessation of the agitation could prevent complete separation of the two sections. So that from the moment of the John Brown raid into Virginia the South saw the necessity of preparing to protect its rights and property—in the Union if possible—out of it if necessary. These were the conditions when, in 1860, the anti-slavery or Republican party elected its candidate, not so much by the strength in the North of its own following as by the division among the Democrats. By the vote which elected Mr. Lincoln the South was given to understand that the Constitution was to be disregarded and slavery destroyed, and so destroyed as to bring financial ruin, if not utter annihilation upon the South, for Wendell Phillips, a recognized leader, has said "The state of things is just what we have attempted to bring about. . . . The Republican party is a party of the North, pledged against the South." And the Southern people turned to the remedy which for three-quarters of a century they had believed to be the legal and proper one for

denial of rights by the national government, namely, withdrawal from the Union — secession.

The Doctrine of Secession.—As stated from the foundation of the Federal government until 1861, and even at that date, the right of secession was insisted upon not only in the South but in the North. In fact New England had been the first to advocate and threaten it. To discover the basis of this doctrine the history of the Federal government must be briefly reviewed. The colonies were settled by the Cavaliers in Virginia, the Puritans in New England, the Hollanders in New York, the Catholics in Maryland, the Quakers in Pennsylvania, the Huguenots in South Carolina and the followers of Oglethorpe in Georgia. The colonists of New England whose descendants spread westward were very different in their ancestry, their education, their beliefs and their customs, from those who settled the South and whose descendants spread over the Southwest. Those of New England were largely the descendants of the Roundheads of England, and entertained ideas similar to theirs. Those of the South sprang from the Cavalier class of England and France. The colonial States when they renounced their allegiance to Great Britain were separate and distinct commonwealths, entirely independent of one another. The desire for complete independence was the claim that welded their union in their efforts to achieve their common end. The political union of these independent colonies was based solely upon the terms of agreement and compact entered into by these separate and distinct bodies. The first union of this character was that formed by the 13 colonies in 1774, which was followed by the union of the States under the Articles of Confederation of 1777 (Maryland being the last State to ratify them, in 1781). On 4 July 1776, the colonies declared "that they are and of right ought to be *Free and Independent States*" — "that whenever any form of government becomes destructive of the ends for which it was established, it is the right of the people to alter or abolish it, and to institute a new government." In the Articles of Confederation the States, while agreeing to clothe the Congress with the powers of a common agent, expressly stipulated "that each State retains its sovereignty, freedom and independence and every power and right which is not, by this Confederation, expressly delegated to the United States in Congress assembled." Great Britain in Article I of the treaty of 3 Sept. 1733, "acknowledges the said United States, namely" (mentioning each of the 13 States), "to be *Free, Sovereign and Independent States*." The confederation under the Articles of 1777 was succeeded by the Union under the Constitution adopted by the 12 States assembled in Constitutional Convention (Rhode Island holding aloof) and subsequently ratified by all the States. It is to be remembered that until North Carolina ratified the Constitution in November 1789, and Rhode Island ratified it in May 1790, these two States were considered as entirely independent commonwealths.

In the Constitutional Convention, and therefore until 1861, the Supreme Court of the United States and the highest courts of the several States maintained in their decisions the principle of the unrelinquished sovereignty of each State, all holding that the central government had no right to exercise any powers, except

such as were expressly delegated, or Congress to enact any laws except in pursuance of an express right granted by the States through the Constitution. This doctrine was formally enunciated in the tenth amendment to the Constitution: "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." The question of coercion of a State was raised in the Constitutional Convention and was quickly disposed of. When a proposition was made to empower Congress "to call forth the force of the Union against any member (meaning State) of the Union failing to fulfill its duty under articles thereof" — Mr. Madison said that "a union of the States containing such an ingredient seemed to provide for its own destruction. The use of force against a State would look more like a declaration of war than an infliction of punishment and would probably be considered by the party attacked as a dissolution of all previous compacts by which it might be bound." He hoped "that such a system would be framed as might render this recourse unnecessary, and moved that the clause be postponed." Madison's motion prevailed unanimously. Every similar proposition was rejected. George Mason said of such a proposition: "Will not the citizens of the invaded State assist one another, until they rise as one man and shake off the Union altogether?" Oliver Ellsworth in speaking to the Connecticut Convention said: "This Constitution does not attempt to coerce sovereign bodies, States, in their political capacity." Alexander Hamilton said in the New York Ratifying Convention: "To coerce the States is one of the maddest projects that was ever devised." Edmund Randolph, one of the most advanced of the Federalists, said that coercion was out of the question. When the States ratified the Constitution they expressed in no uncertain terms their insistence that the State could not be coerced and could at any time withdraw from the confederation and retake the powers granted to the Federal government. New York and Rhode Island said that "the powers of government may be reassumed by the people whenever it shall become necessary to their happiness." Virginia in ratifying did "declare and make known that the powers granted under the Constitution being derived from the people of the United States, may be reassumed by them, whensoever the same shall be perverted to their injury or oppression, and that every power not granted thereby remains with them and at their will." The principle of the right of secession had always been sanctioned by the people of Massachusetts. When it was proposed to annex Louisiana to the Federal Union, the legislature of Massachusetts passed the following resolution: "That the annexation of Louisiana to the Union transcends the constitutional power of the government of the United States. It formed a new confederacy, to which the States united by the former compact *are not bound to adhere*." And in 1844 and again in 1845 the same legislature resolved: "That the project of the annexation of Texas, unless arrested on the threshold, *may drive these States into a dissolution of the Union*."

Alexander Hamilton was without question one of the most extreme advocates of a strong central national government, but even he ex-

pressed himself emphatically that any attempt on the part of Congress to enact a law which involved the exercise of power which was not granted by the Constitution would be an invasion of the power reserved to the States. He discussed this question in the 31st number of the *Federalist*, and concludes in these words: "Hence we perceive that the clause which declares the supremacy of the laws of the Union, like the one we have just considered, only declares a truth which flows immediately and necessarily from the institution of a Federal government. It will not, I presume, have escaped observation, that it expressly confines this supremacy to the laws made pursuant to the Constitution." At the time of the adoption of the Constitution, during the period of ratification and for many years thereafter this principle was not questioned. It was so thoroughly recognized that so long as any members of the Constitutional Convention remained members of Congress, and for a long period thereafter, that body confined its acts to expressly granted powers; and the messages of the Executive to Congress were only explanations of the condition and state of the Union — so very different from the messages since 1865 which are largely devoted to proposed policies of the administration, and exact from the President's party loyal obedience thereto.

In 1839 John Quincy Adams in his speech on the occasion of the 50th anniversary of our government under the Constitution said:

But the indissoluble union between the several States of this confederated nation is, after all, not in the right but in the heart. If the day should ever come (may Heaven avert it) when the affections of the people of these States shall be alienated from each other; when the fraternal spirit shall give way to cold indifference, or collision of interest shall fester into hatred, the bonds of political asseveration will not long hold together parties no longer attracted by the magnetism of conciliated interests and kindly sympathies; and far better will it be for the people of the disunited States to part in friendship from each other than to be held together by constraint. Then will be the time for reverting to the precedents which occurred at the formation and adoption of the Constitution to form again a more perfect Union by dissolving that which can no longer bind, and to leave the separated parts to be reunited by the law of political gravitation to the centre.

That Mr. Adams felt that these views were consistent with a true interpretation of the original compact which bound the people together is shown by the fact that three years later, 24 Jan. 1842, he presented to Congress a secession petition from citizens of Haverhill, Mass. In the *Congressional Globe* (Vol. II, p. 977) appears the following:

Monday, January 24.—In the House Mr. Adams presented the petition of sundry citizens of Haverhill, in the State of Massachusetts, praying that Congress will immediately adopt measures, peaceably to dissolve the Union of these States: First, because no union can be agreeable or permanent which does not present prospects of reciprocal benefits; second, because a vast proportion of the revenues of one section of the Union is annually drained to sustain the views and course of another section, without any adequate return; third, because, judging from the history of past nations, that Union, if persisted in in the present state of things, will certainly overwhelm the whole nation in destruction.

On the question of the reception of the petition, there were 40 votes in favor of it and 166 against. The following resolution was then introduced: "Resolved: That in presenting to the consideration of this House a petition for the dissolution of the Union, the member from Massachusetts (Mr. Adams) has justly incurred the censure of this House." Another resolution was introduced declaring that Mr. Adams

had offered the deepest indignity to the House and an insult to the people of the United States. In defending his position Mr. Adams said:

I hold that it is no perjury, that it is no high treason, but the exercise of a sacred right to offer such a petition, and that it is as false in morals as it is inhuman to fasten that charge on men who, under the countenance of such declarations as I have here quoted, come and ask this House a redress of grievances. And if they do mistake their remedy this government should not turn them away and charge them with high treason and subornation of perjury; but ought to take it up, to weigh the considerations which can be urged in their favor; and if there be none but those which are so eloquently set forth in the pamphlet I have quoted, these should be considered. If they have mistaken their remedy, the House should do as the gentleman from Kentucky (Mr. Marshall) told us he was ready to do — admit the facts.

"The trial of Mr. Adams, to the exclusion of all other business, commenced on 25 January, and terminated on 7 February, when the whole proceedings were laid on the table without deciding a single question." This action of the House was construed by some as an admission that circumstances might arise which would justify States in withdrawing from the Union. Daniel Webster in his speech at Buffalo on 22 May 1851 denounced the anti-slavery agitators who were opposing the enforcement of the Fugitive Slave Law, and demanded that they should observe the laws and the Constitution. And a little later, at Capron Springs, he said:

How absurd it is to suppose that when different parties enter into a compact for certain purposes, either can disregard any one provision, and expect, nevertheless, the other to observe the rest. . . . I have not hesitated to say, and I repeat, that if the northern States refuse wilfully and deliberately to carry into effect that part of the Constitution which respects the restoration of fugitive slaves, and Congress provide no remedy, the South would no longer be bound to observe the compact. A bargain cannot be broken on one side and still bind on the other side. I say to you, gentlemen in Virginia, as I said on the shores of Lake Erie and in the city of Boston, as I may say again in that city or elsewhere in the North, that you of the South have as much right to receive your fugitive slaves as the North has to any of its rights and privileges of navigation and commerce. . . . I am as ready to fight and fall for the constitutional rights of Virginia as I am for those of Massachusetts.

Horace Greeley, the abolitionist, strongly insisted, in 1860, upon the right of the Southern States to secede, as the following extracts from the *Tribune* show:

New York *Tribune*, 9 Nov. 1860.—If the cotton States shall become satisfied that they can do better out of the Union than in it, we insist on letting them go in peace. The right to secede may be a revolutionary one, but it exists nevertheless.

And again in the same issue of his widely circulated and influential paper, Mr. Greeley said:

We must ever resist the asserted right of any State to remain in the Union and nullify or defy the laws thereof. To withdraw from the Union is quite another matter; and whenever a considerable section of our Union shall deliberately resolve to go out, we shall resist all coercive measures designed to keep it in.

New York *Tribune*, 16 Nov. 1860.—Still we say, in all earnestness and good faith, whenever a whole section of this republic, whether a half, a third, or only a fourth, shall truly desire and demand a separation from the residue, we shall earnestly favor such separation. If the twelve slave States, or even the eight cotton States alone, shall quietly, decisively, say to the rest, "We prefer to be henceforth separated from you," we shall insist they be permitted to go in peace.

New York *Tribune*, 19 Nov. 1860.—Now we believe and maintain that the Union is to be preserved only so long as it is beneficial and satisfactory to all parties concerned. We do not believe that any man, any neighborhood, town, county, or even State may break up the Union in any transient gust of passion; we fully comprehend that secession is an extreme, an ultimate resort — not a constitutional but a revolutionary remedy. But we insist that

this Union shall not be held together by force whenever it shall have ceased to cohere by the mutual attraction of its parts; and whenever the slave States or the cotton States only shall unitedly and coolly say to the rest, "We want to get out of the Union," we shall urge that their request be acceded to.

New York Tribune, 30 Nov. 1860.—Are We Going to Fight?—But if the cotton States generally unite with her in seceding, we insist that they cannot be prevented, and that the attempt must not be made.

New York Tribune, 24 Dec. 1860.—Most certainly we believe that governments are made for the peoples, not peoples for the governments; that the latter derive their just power from the consent of the governed; and whenever a portion of this Union, large enough to form an independent self-sustaining nation, shall show that, and say authentically to the residue, "We want to get away from you," I shall say, and we trust self-respect, if not regard for the principles of self-government, will constrain the residue of the American people to say, "Go."

New York Tribune, 28 Dec. 1860.—Nor is it treason for the State to hate the Union and seek its disruption. A State, a whole section, may come to regard the Union as a blight upon its prosperity, an obstacle to its progress, and be fully justified in seeking its dissolution. And in spite of the adverse clamor, we insist that if ever a third or even a fourth of these States shall have deliberately concluded that the Union is injurious to them, and that their vital interests require their separation from it, they will have a perfect right to seek separation; and should they do so with reasonable patience and due regard for the rights and interests of those they leave behind, we shall feel bound to urge and insist that their wishes be gratified—their demand conceded.

During the time the States were seceding Mr. Greeley published many similar statements. Nor was the *Tribune* alone, for much of the New York press and prominent journals and able editors in many of the Northern States coincided in these views. "Wayward sisters, go in peace," was the cry on every hand, echoed from the lips of the general of the army, with the refrain uttered by the eminent Republican leader Salmon P. Chase: "The South is not worth fighting for; let them alone." The *New York Herald*, a journal which claimed to be independent of all party influences, said on 25 Nov. 1860: "Coercion in any event is out of the question. A Union held together by the bayonet would be nothing better than a military despotism." And the same paper said: "Each State is organized as a complete government, holding the purse and wielding the sword, possessing the right to break the tie of the confederation, and to repel coercion as a nation might repel invasion. . . . Coercion, if it were possible, is out of the question." The *New York Times* of 3 and 4 Dec. 1860 appealed to the people of the North to repeal the State laws preventing the return of fugitive slaves and by moderation and forbearance to prevent the threatened and almost inevitable dissolution of the Union. In March 1861, after Lincoln's inauguration, the *Commercial*, the leading Republican paper of Ohio, said:

We are not in favor of blockading the southern coast. We are not in favor of retaking by force the property of the United States now in possession of the seceders. We would recognize the existence of a government formed of all the slaveholding States and attempt to cultivate amicable relations with it.

In January 1861, after six States had seceded, James S. Thayer said, at a great meeting in New York:

We can at least, in an authoritative manner, arrive at the basis of a peaceable separation. . . . The public mind will bear the avowal, and let us make it,—that if a revolution of force is to begin, it shall be inaugurated at home. And if the incoming administration shall attempt to carry out the line of policy that has been foreshadowed, we announce that, when the hand of black Republicanism turns to blood-red, and seeks from the fragments of the Constitution to construct a scaffolding for coercion—another name for execution—we will reverse the order of the French

Revolution, and save the blood of the people by making those who would inaugurate a reign of terror the first victims of a national guillotine!

These expressions were received with enthusiastic applause. At the same meeting ex-Gov. Horatio Seymour asked whether "successful coercion by the North is less revolutionary than successful secession by the South?" At the same meeting ex-Chancellor Walworth said: "It would be brutal, in my opinion, to send men to butcher our own brothers of the Southern States as it would be to massacre them in the Northern States." Other distinguished speakers and editors throughout the North and West repeatedly expressed the same sentiments. Even Mr. Lincoln, when delivering his inaugural address on 4 March 1861, although arguing the right to secede, did not openly enunciate the right of coercion, and while asserting his intention "to hold, occupy and possess the property and places belonging to the government, and collect the duties and imposts," said that "beyond what is necessary for these objects there will be no invasion, no using of force, against or among the people anywhere."

Course of Secession.—The Southern States having no hope of retaining or obtaining their rights under the Constitution except by a separation from the Federal government called conventions to decide upon what course to pursue, and ended by withdrawing from the Union. South Carolina took the lead, her Ordinance of Secession being adopted 20 Dec. 1860. Six other States quickly followed her in the following order: Mississippi on 9 January, Florida on 10 January, Alabama on 11 January, Georgia on 18 January, Louisiana on 23 January and Texas on 1 Feb. 1861. As one by one the Southern States fell into line asserting their right and determination to renounce the Federal compact, the United States officials in these States, both military and civil, peacefully turned over their charge within the limits of each State to the authorities of the same, the only exceptions being the isolated fortifications of Fort Sumter and Fort Pickens. The machinery of government went on without delay, the same officials performed their customary duties, and when the provisional government was established the only change was the substituting the authority and name of the Confederate States for those of the United States. On 21 Jan. 1861 Jefferson Davis, in his speech when relinquishing his seat in the United States Senate, said:

I rise, Mr. President, for the purpose of announcing to the Senate that I have satisfactory evidence that the State of Mississippi by a solemn ordinance of her people, in convention assembled, has declared her separation from the United States. . . . If it be the purpose of gentlemen they may make war against a State which has withdrawn from the Union; but there are no laws of the United States to be executed within the limits of a seceded State. A State, finding herself in the condition in which Mississippi has judged she is—in which her safety requires that she should provide for the maintenance of her rights out of the Union—surrenders all the benefits (and they are known to be many), deprives herself of the advantages (and they are known to be great), severs all the ties of affection (and they are close and enduring), which have bound her to the Union; and thus divesting herself of every benefit—taking upon herself every burden—she claims to be exempt from any power to execute the laws of the United States within her limits. . . . We recur to the principles upon which our government was founded; and when you deny them and when you deny to us the right to withdraw from a government which, thus perverted, threatens to be destructive of our rights, we but tread in the path of our fathers, when we proclaim our independence and take the hazard.

Here in the words of the man who was afterward the chosen chief of the reorganized federation, the reason for secession is given and the right of secession claimed. The senators from Florida and Alabama withdrew at the same time.

The Peace Congress.—On 19 Jan. 1861, the legislature of Virginia in extraordinary session passed a resolution requesting all the States to send delegates to Washington to meet in convention on 4 February to confer upon some feasible and possible plan upon which to settle the difficulties between the sections. The body which is known in history as the Peace Congress sat in Washington from 4 to 27 February, but accomplished nothing. Five Northern States were not represented, and while there still existed a very conciliatory spirit in many parts of the North, it was unfortunate that many prominent men were bitterly opposed to the slightest concessions to the South. The speech of Judge Chase of Ohio, afterward Chief Justice of the United States, distinctly gave it to be understood that the Northern States would make no concessions. He said:

The result of the national canvass which recently terminated in the election of Mr. Lincoln, has been spoken of by some as the effect of a sudden impulse or of some irregular excitement of the popular mind; and it has been somewhat confidently asserted that, upon reflection and consideration, the hastily formed opinions which brought about that election will be changed. . . . I cannot take this view of the result of the presidential election. I believe, and the belief amounts to absolute conviction, that the election must be regarded as a triumph of principles cherished in the hearts of the people of the free States. . . . We have elected him [Mr. Lincoln]. After many years of earnest advocacy and of severe trial we have achieved the triumph of that principle. By a fair and unquestioned majority we have secured that triumph. Do you think we, who represent this majority, will throw it away? Do you think the people will sustain us if we undertake to throw it away? I must speak to you plainly, gentlemen of the South. It is not in my heart to deceive you. I therefore tell you explicitly that if we of the North and West would consent to throw away all that has been gained in the recent triumph of our principles, the people would not sustain us, and so, the consent would avail you nothing.

The *Congressional Globe*, Vol. 31, Part 2, p. 1247 (27 Feb. 1861) contains letters from Senators Bingham and Chandler to Governor Blair of Michigan. Senator Bingham wrote as follows:

Washington, 15 Feb. 1861.

Dear Sir:—When Virginia proposed a convention in Washington in reference to the disturbed condition of the country I regarded it as another effort to distract the public mind, and a step towards obtaining that concession which the imperious slave power so insolently demands. . . . We have been assured by friends upon whom we can rely that if those two States, Michigan and Wisconsin, should send delegations of true unflinching men, there would probably be a majority in favor of the Constitution as it is, who would frown down rebellion by enforcement of laws. . . . It cannot be doubted that the recommendations of the convention will have a considerable influence upon the public mind, and upon the action of Congress.

I hope I shall be pardoned for suggesting that it may be justifiable and proper, by any honorable means, to avert the lasting disgrace which will attach to a free people who, by the peaceful exercise of the ballot, have just released themselves from the tyranny of slavery, if they should now succumb to treasonable threats, and again submit to degrading thralldom. . . .

K. S. Bingham.

To His Excellency, Governor Blair.

Senator Zach Chandler wrote:

Washington, 11 Feb. 1861.

My dear Governor:—Governor Bingham and myself telegraphed you on Saturday, at the request of Massachusetts and New York, to send delegates to the Peace or Compromise Congress. They admit that we were right, and that they were wrong; that no Republican State should

have sent delegates; but they are here and they cannot get away; Ohio, Indiana, and Rhode Island are caving in, and there is danger of Illinois; and now they beg us, for God's sake, to come to their rescue, and save the Republican party from rupture. I hope you will send *stiff-backed* men, or none. The whole thing was gotten up against my judgment and advice, and will end in thin smoke. Still, I hope, as a matter of courtesy to some of our erring brethren, that you will send the delegates.

Truly your friend,

Z. Chandler.

His Excellency, Austin Blair.

P. S.—Some of the manufacturing States think that a fight would be awful. Without a little *blood-letting*, this Union will not, in my estimation, be worth a rush.

These letters were promptly published in the *Detroit Free Press* and also in the *Congressional Globe*. Senator Powell commenting, in the Senate, upon the letters, said: "I think it evident from these letters that there is and has been a fixed purpose in certain quarters, that the peace conference should do nothing. It is very evident that these 'stiff-backed' gentlemen were to be sent in order to prevent any compromise being presented." Senator Chandler said: "It is a question in which the people of Michigan take a great interest. They are opposed to all compromises; they do not believe that any compromise is necessary, nor do I. They are prepared to stand by the Constitution of the United States as it is; ay, sir, to stand by it to blood, if necessary." A majority of the convention or congress was sufficiently moderate to recommend a measure to Congress which would, without doubt, have preserved peace and union, but when presented to the United States Congress it was met with cool indifference, objection was made to its consideration and upon a vote it was rejected.

The failure of the Peace Congress and the finally expressed determination of the government to make no concessions and to exercise the forces of the government in coercion forced Virginia and the other so-called border States from their conservative position. Arkansas adopted an Ordinance of Secession on 15 April, and Virginia on 17 April. In the latter State the Ordinance was to be made subject to the ratification of the people late in May, but the action of the Federal government in preparing for war and the proclamation of President Lincoln calling for troops hastened her union with her sister States of the South. Tennessee passed an Ordinance of Secession on 6 May, which was ratified by the people on 8 June, and North Carolina seceded on 20 May. Such a division of sentiment existed in Kentucky and Missouri that while they did not secede they were given representation in the Confederate Congress.

Formation of the Confederate Government.—In the meantime the several conventions of the first seven seceded States appointed deputies to a congress, naming Montgomery, Ala., as the place and 4 February as the time of meeting. This assembly formed a new federation under the name of the Confederate States of America, elected Jefferson Davis of Mississippi, President and Alexander H. Stephens of Georgia, Vice-President, and drew up a Constitution establishing a provisional government, and on 11 March adopted the permanent Constitution of the Confederate States. Alexander Stephens, who knew his people, had distinctly declared that "the tendency of the large majority of Georgia is to conser-

vatism," and this was true as well of all the other States. It was Mr. Lincoln's proclamation of 15 April that destroyed the last remaining vestige of the hope entertained by the conservatives that a return to the principles of the Constitution by the people of the North and the Federal government might bring about a reconstruction of the Union, a hope to which their hearts still clung tenaciously. Had not two States held aloof from the compact of 1787 to return in 1789 and 1790? Why might not history repeat itself? they thought and argued. The seat of government of the Confederacy was removed to Richmond, Va., and the Provisional Congress met there on 20 July 1861. At this session delegates from Virginia, North Carolina and Tennessee were added to the body. The Second Congress met on 22 Feb. 1862, with full representation from Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, Missouri, North Carolina, South Carolina, Tennessee, Texas and Virginia. In the Second Congress which convened on 22 Feb. 1862, the 13 States above named were represented and delegates were present from Arizona and from the Cherokee, Choctaw, Creek and Seminole Nations.

Secession of West Virginia.—As above noted the Virginia Convention passed an ordinance of secession on 17 April 1861, which was submitted to the people and adopted by them. There was a majority against it in the north-western part of the State. In June 1861, a convention of the Unionist counties was held in Wheeling. This convention adopted an ordinance for a reorganization of the State government, and in August adopted an ordinance providing for the formation of a new State. Most of the citizens being in the field as soldiers on one side or the other, a very small vote was polled, but a majority was for the formation of a new State. In May of 1862 the "reorganized government" of this part of Virginia passed a bill authorizing the formation of a new State. On 31 Dec. 1862, the Congress of the United States passed an act admitting the State of West Virginia into the Union, the law having the following preamble:

Whereas, the people inhabiting that portion of Virginia known as West Virginia did, by a convention assembled in the city of Wheeling on the twenty-sixth of November, eighteen hundred and sixty-one, frame for themselves a Constitution with a view of becoming a separate and independent State; and whereas at a general election held in the counties composing the territory aforesaid on the third day of May last, the said Constitution was approved and adopted by the qualified voters of the proposed State; and whereas the legislature of Virginia, by an act passed on the thirteenth day of May, eighteen hundred and sixty-two, did give its consent to the formation of a new State within the jurisdiction of the said State of Virginia, to be known by the name of West Virginia, and to embrace the following named counties. . . .; and whereas both the convention and the legislature aforesaid have requested that the new State should be admitted into the Union, and the Constitution aforesaid being Republican in form, Congress doth hereby consent that the said forty-eight counties may be formed into a separate and independent State.

The End of Secession.—Although the Supreme Court of the United States several times decided that the seceded States were never *legally* out of the Union, yet for four years the secession of 11 States was an accomplished fact, and for four years the Confederate States of America was a *de facto* government, exercising, through its executive, legislative and judicial departments, all the powers and functions of a Federal government within the territory of the

States which comprised it, under a constitution modeled upon the Constitution of the United States and adopted and ratified by the people of its States. In the States themselves there was no change nor interruption in any of the affairs of government except in the places which were occupied by the Federal armies. But by force of arms the Confederate government was overthrown and each of the seceded States, after a period of reconstruction, came back and took its place in the Union under the old Constitution as amended by the victorious party in the great conflict. See also CIVIL WAR; UNITED STATES — CAUSES OF THE CIVIL WAR; UNITED STATES — SECESSION.

BRIG.-GEN. JOSEPH WHEELER,
Author of 'Military History of Alabama.'

SECESSIONISTS, the members of an association in Germany similar to that formed in the Société des Beaux Arts at Paris. The Secessionists were artists who revolted against the strictly academic and traditional spirit in which selections and awards were made by the jury which decided the hanging of pictures in the Academy of Art and distributed the medals and other awards voted to their merits. In 1892 Piglhein (q.v.), F. von Uhde (q.v.), Dill, A. Keller, Stück and others founded a new school of naturalism, and this movement in German art was greeted with the same howl of derision as that with which the Pre-Raphaelites in England had been met. The movement gained ground, especially in Munich, however, the headquarters of a strong conservative and academic coterie. The new spirit here burst into actual revolt; and the members of the "Munich Secession" actually built a new exhibition building for themselves. Their work, moreover, won public recognition and the leaven of their example did its work in vivifying German art. The movement is now merged in the Deutscher Künstlerbund founded in 1904. Consult Bierbaum, 'Fritz von Uhde'; De la Mazelière, 'La peinture Allemande au XIXe siècle' (1900).

SECESSIONVILLE, sē-sēsh'ōn-vīl, Battle of. In May 1862, Gen. D. Hunter, commanding the Department of the South, began preparations for throwing troops upon James Island to make a quick advance upon Charleston, S. C. On 2 June the advance of Gen. I. I. Stevens was landed in the southwest part of the island, and next day made a reconnaissance in force to within a short distance of a battery at Secessionville, about two miles from Stone River, with water on three sides. It was on a narrow causeway bordered by swamps, and approachable by land only from the west. The gunboats co-operated in the movement, which was but partially successful, the Confederates, under Lieut-Col. Ellison Capers, 24th South Carolina, defending the position and inflicting upon Stevens a loss of 17 killed and wounded and taking 22 prisoners. The effect was increased watchfulness on the part of the Confederates, the strengthening of the forces on James Island and the stoppage at Charleston of troops that had been ordered to Richmond to resist McClellan. On the 8th Stevens made another reconnaissance, came under artillery fire and withdrew with a loss of seven killed and wounded. On the same day General Wright's division arrived from Edisto

Island and the next day marched to near Grimbail's Landing, two or three miles to the left of Stevens, who was covering the position opposite Legareville, on John's Island. It was determined to carry the battery by a rush, and thus open the way to Charleston, but 10 miles distant; and orders were given for an assault to be made at dawn of 11 June, but Col. T. G. Lamar, in command of the Confederate works at Secessionville, assumed the offensive and toward evening of the 10th attacked Wright's pickets and advance posts with infantry and artillery and was repulsed, suffering severe loss and inflicting upon Wright a loss of about 25 killed and wounded. This caused a postponement of the assault and the beginning of the construction of a battery to silence the Confederate guns. General Hunter, disappointed in his expectation of carrying Charleston with a rush, returned to Hilton Head on the 11th, leaving orders with General Benham, next in command, to make no attempt to advance on Charleston or on Fort Johnson until largely reinforced but to provide, however, for "a secure intrenched encampment." At the end of five days the battery had been constructed, but it failed to silence the Confederate guns, and Benham, as Hunter says, "disobeyed positive orders and clear instructions" and against the emphatic protest of his two division commanders proceeded to assault the work. He had for the purpose 3,100 men under General Wright and 3,500 under General Stevens. The work to be assaulted had an earthen parapet seven to eight feet high, outside of which was a ditch seven feet deep and in front of which was a strong abatis. A line of rifle-pits extended on both flanks and in the rear, sweeping the open interior of the work. Its armament was six heavy guns—8-inch columbiads and rifled 24- and 18-pounders. It was defended by about 1,000 men, and there were supports near that came at the close of the action. Stevens, with his 3,500 men, was to make the assault and Wright, moving from Grimbail's Landing, was to co-operate by moving on his left and rear. Stevens had two brigades, Colonel Fenton's (8th Michigan, 7th Connecticut, 28th Massachusetts) and Colonel Leasure's (46th and 79th New York and 100th Pennsylvania), and four guns. At 3.30 A.M., the troops were assembled beyond the camps and at 4 A.M., when it was so dark one man could not follow another except at short intervals, the column moved forward, Fenton leading, with a storming party of two companies of the 8th Michigan, closely followed by the other eight companies of the regiment, the 7th Connecticut and the 28th Massachusetts. Leasure followed Fenton. The advance moved quietly and when within 800 yards of the work surprised and captured a small picket-guard without firing a shot and orders were given to accomplish the allotted task with the bayonet only. Lamar had knowledge of the movement and had sent for reinforcements and was standing by his heavy guns, which had been charged with canister, as the leading regiment came within 300 yards and deployed into line; then his guns opened their canister-fire, and at the same time heavy volleys of musketry from dikes and hedges were poured upon the right flank of the assaulting column. The Union regiments closed up rapidly and made a rush

for the work, shooting down the gunners; all the regiments got close to the work and men of each went through the abatis; men of the 8th Michigan and 79th New York gained the ditch and scaled the parapet. "Some of them," says Beauregard, "in the impetus of the assault went even inside one of the salients of the works"; but it was of no avail; the mingled Union troops could not be handled and at 5 o'clock, after a severe contest of 25 minutes, they fell back 500 yards to a hedge, under cover of artillery, with a loss of over 500. Wright had participated in the movement by checking a reinforcement on its way to the work, but did not become seriously engaged, although losing some men. At 9 o'clock Benham ordered Stevens back to camp. The Union loss was 107 killed, 487 wounded and 89 missing, an aggregate of 683. The Confederates report a loss of 52 killed, 144 wounded and 8 missing. The result of the battle was fatal to the plan of an immediate advance on Charleston and late in June the Union troops were ordered to withdraw from James Island and for some time to come no further attempt was made to capture the city. Consult 'Official Records,' Vol. XIV.

E. A. CARMAN.

SECHEM, Palestine. See NABULUS.

SECHIUM, a genus of the gourd family (*Cucurbitaceæ*) with one species (*S. edule*). This is a perennial, rough-stemmed, climbing vine native to the West Indies and the neighboring mainland, sometimes cultivated for covering arbors, since it makes a rapid and sturdy growth, but chiefly for the valuable food afforded by its roots and fruits. It has large, thin, heart-shaped leaves five-angled like those of the cucumber; branched tendrils opposite the leaves, and yellowish, monœcious flowers, the pistillate solitary or paired in the axils, the staminate in a raceme. These flowers have rotate calices and five-parted corollas and a one-celled ovary with six-lobed stigma, which matures into a pear-shaped fruit, some six inches long. It has an irregularly ribbed or furrowed surface slightly spiny, but shining, and in color ranging from pale green to creamy tints; the interior is fleshy and white, and contains a large flat seed, which germinates within the pericarp, often before it falls from the vine, so that the whole fruit is planted. This fruit is edible, as is also the very large, corky and starchy root-tuber, sometimes weighing 20 pounds, and both are cooked as vegetables having somewhat the flavor of turnips. The sechium fruit is called vegetable pear in the British colonies, and has local names such as chayote or pepinella.

SECKENDORF, Friedrich Heinrich, frēd'-rīh hīn'rīh zēk'ēn-dōrf, COUNT VON, Franconian soldier and diplomat: b. Königsberg, 5 July 1673; d. Meuselwitz, Germany, 23 Nov. 1763. He served in the war against the Turks on the Danube, and in that of the Spanish Succession, greatly distinguished himself at Blenheim in 1704 and was present as an Ambassador at the conclusion of the Peace of Utrecht. He also served in the war against Sweden, 1715, and against the Spaniards in Sicily, 1720. In 1726 he was Ambassador to Berlin and gained over Frederick William I to acknowledgment of the pragmatic sanction and an alliance with Austria.

Seckendorf next served in the war of the Polish Succession, gaining victory over the French at Klausen. During the Turkish War he was made field-marshal in 1737, and commander-in-chief. He was unsuccessful, however, and was recalled and imprisoned in the fortress of Grätz. Receiving no appointment when released, he entered the service of Charles VII of Germany against Maria Theresa. He cleared Bavaria of Austrian troops, but on the emperor's death in 1745 peace was established and Seckendorf was restored to his Austrian honors. He retired to his castle at Meuselwitz, but in 1788 was imprisoned by Frederick II of Prussia, on a charge of intriguing against that country, and was only released after six months upon the payment of 10,000 thalers.

SECKENDORF, Gustav Anton von, BARON ("PATRICK PEALE"), German dramatist and novelist: b. near Altenburg, Germany, 26 Nov. 1775; d. Alexandria, La., 1823. He was educated at Leipzig, Freiburg and Wittenberg, became well known as a writer and lecturer and died while on a lecturing tour in the United States, where he was known as "Patrick Peale." His works include 'Otto III, der gutgeartete Jüngling' (1805); 'Kritik der Kunst' (1812); 'Beiträge zur Philosophie des Herzens' (1814); 'Des Vaters Bild' (1822), etc.

SECKER, Thomas, English prelate: b. Sibthorpe, Nottinghamshire, 1693; d. Canterbury, England, 3 Aug. 1768. He studied medicine at London and at Paris, and took his degree at Leyden in 1721, after which he decided to enter the ministry. He was graduated from Oxford in 1722, and in the following year was ordained a priest. His first living was at Houghton-le-Spring in 1724, and in 1727 became rector of Ryton and prebendary of Durham. He was appointed chaplain to the king in 1732, became rector of Saint James', London, in 1733, bishop of Bristol in 1735, of Oxford in 1737, dean of Saint Paul's in 1750 and archbishop of Canterbury in 1758. He was a wise, large-hearted and hard-working bishop, and an able though not a brilliant preacher.

SECOND, a division of time, the 60th part of a minute of time or of a minute of a degree. The hour and degree are each divided into 60 minutes (marked thus, 60'), and each minute is subdivided into 60 seconds (marked thus, 60").

In music, the interval of a second is the difference between any sound and the next nearest sound above or below it. There are three kinds—the minor second or semitone, the major second and the extreme sharp second. Also a lower part added to a melody when arranged for two voices or instruments.

SECOND ADVENT OF CHRIST. See MILLENNIUM.

SECOND ADVENTISTS. See ADVENTISTS.

SECOND CENTURY. The outstanding feature of the history of the 2d century is the series of reigns of the so-called Spanish Cæsars. Trajan (98-117) who ruled when the Roman Empire was at its greatest extent was the first. His successors until 180 A.D. are all men selected for their tasks by wise predecessors, to become benevolent autocrats in the best sense of the word. Ruling the civilized world with firmness and wisdom, humanity is said to

have had more chance for happiness under them than in any other corresponding period of the world's history, and yet even they persecuted the Christians. Trajan's successors were Adrian, or Hadrian (117-138); Antoninus Pius (138-161) and Marcus Aurelius (161-180). Each of these adopted a successor whom he thought capable of bearing the great burden of ruling the Roman Empire worthily. Marcus Aurelius, however, was succeeded by his son, Commodus (180-193), profligate and cruel to an extent that has made his name a by-word in history, weak and incompetent as a ruler, so that the barbarians played sad havoc on the frontiers of the empire. After Commodus, Pertinax (193) was proclaimed by the Prætorian guards who assumed the function of disposing of the empire. He was murdered after a reign of three months. Then the empire, offered for sale by the Prætorians, was bought by Didius Julianus (193) for some \$10,000,000. He was put to death not long after by an order of the Senate and was succeeded by Septimius Severus, elected by the soldiers of the army of the Danube. Severus defeated two rivals for the empire who had also been elected by their soldiers and proceeded to give Rome a strong government. His reign was stained at the beginning of the 3d century by a bitter persecution of the Christians (202).

The Spanish Cæsars have an individuality that has won for each of them a special place in history. Trajan was a native of Spain and a soldier, elected by the Senate after the death of Nerva, who had made him an associate in the government. Trajan pushed the limits of the Roman Empire farther than ever before. He conquered Armenia and invaded the lands beyond the Euphrates to bring most of what had been Assyria under Roman rule. Out of the conquered territory he made three Roman provinces under their names of Armenia, Mesopotamia and Assyria. In the earlier part of his reign he had conquered the Dacians and thrown a bridge across the Danube, some of the piers of which are still standing. He brought a colony of Romans to settle in the conquered provinces, so that ever since it has been called Roumania. In honor of his conquests, Trajan erected at Rome the famous column called by his name, which tells the story of his Dacian wars. The spiral band of sculptures on it contains more than 25,000 figures. In spite of his beneficent rule, Trajan is responsible for the third persecution of the Christians, the first having come under Nero and the second under Domitian. A letter of Pliny the Younger to Trajan tells how rapidly this "contagious superstition" as he calls it was spreading throughout not only the cities but the towns and the country. Trajan feared that their refusal to sacrifice to the Roman gods would lessen their fidelity to the empire, so he began a bitter persecution. The blood of martyrs only proved the seed of new Christians and attracted worldwide attention to this faith for which men were ready to die.

Trajan's successor Adrian, another Spaniard born, did much to consolidate the Roman Empire. In person he superintended the construction of a wall across the northern part of what is now England, from the Tyne to Solway Firth. The remains of the old Roman wall can still be plainly traced over most of its course.

Then he spent some time in Gaul, proceeding to the East, everywhere to devote himself to the good of the empire. Whenever he stayed long in a city, he made it a point to leave some magnificent public structure, temple, arch, theatre or other building as a memorial of his presence there. He spent some time in Athens and did very much to restore its old glory. The last years of his reign he was at Rome, where he built the Pantheon, still one of the architectural wonders of the world, and a magnificent tomb for himself on the other side of the Tiber, not far from the Vatican, now known as the Castle of Saint Angelo. During his reign, the Jews who had flocked back in large numbers to Palestine from which they had been driven by Titus, had all their religious feelings outraged to the last degree by the attempt to place a statue of Jupiter on the site of what remained of their old temple. They revolted and more than half a million of Jews perished, nearly all of the survivors being forced into exile. This was the final dispersion of the Chosen People.

Hadrian's successor was his adopted son, Aurelius Antoninus, surnamed Pius. He reigned 23 years, during which the empire was absolutely peaceful and extremely prosperous. He devoted himself to the benefit of the provinces and the marvelously beautiful Roman aqueduct near Nimes in France erected by him is a type of his work for them. Happy peoples have no history and the greatest event in the reign of Antoninus was the association in the government with himself early in his reign of his adopted son, Marcus Aurelius. They are often spoken of as the Antonines and the 42 years of their reign from 138 to 180 are in Roman phrase a red-letter time for humanity. Marcus Aurelius (q.v.) was a philosopher of the Stoic school and his 'Meditations' (see MEDITATIONS OF MARCUS AURELIUS) probably represent the highest flight of merely human thinking with regard to man's duties toward himself, his fellows and the Author of the universe in which he is placed. Marcus Aurelius not only wrote and studied but worked. He accomplished an immense amount of good for the poor of Italy in a spirit that closely resembled that of Christianity.

It seems not unlikely that he was influenced by the Christian writings. He established homes for orphans and also for the old and made it one of the tasks of his life to see justice done. When the poor of Italy were loaded with taxes which had accumulated until they could not pay them, he caused all the tax claims to be heaped in the Forum and burned, thus freeing the people from an oppressive burden at one stroke.

Marcus Aurelius' life of meditation was rudely disturbed by the necessities of his reign as emperor. He had to direct and lead armies against barbarians on all frontiers. Roman generals defeated the Parthians and Aurelius was compelled to extend the Roman frontier in the East into Mesopotamia once more, though he had hoped that the Euphrates was sufficient protection. Teutonic tribes along the Rhine and the Danube compelled him to lead his legions himself and practically all his later years were spent in camp. Roman affairs were very discouraging after the period of peace and

worse was to follow. The bubonic plague was brought back from the East by the armies who had fought there and it raged with fearful virulence. Some towns and districts were actually depopulated, the few remaining alive preferring not to dwell in the old scenes. Between wars and the plague, the Romans were tempted to believe that there must be some fault of theirs calling down the vengeance of the gods. They concluded that it must be the Christians' worship of a new god who had provoked the anger of the old gods. So much disaffection was created by this that finally the philosopher emperor, in spite of his own refusal to believe any such nonsense, was brought to consent to the beginning of the frightful persecution of the Christians which occurred in his reign. Ever since the year 112, under Trajan, the Christians had lived in the danger of persecution, at times tolerated, at others the subject of severe measures. This state continued in spite of the philosopher emperors for the full hundred years down to 211.

Commodus was a typical example of that non-heredity so often noticed in the sons of great men. Few men in the history of humanity have been worse. Born at Lanuvium in 161, he became emperor before he was 20, after having been a youth of great promise and apparently excellent character. His father wrote the 'Meditations,' it is said for the benefit of his son. How disappointed he would have been in him had he lived! For some three years, Commodus, under the influence of the wise counsellors, appointed by his father, was a model ruler. Then the discovery of a conspiracy against his life changed his whole character and his rule was little better than that of a maniac. He succeeded with almost insane cunning in securing the popular favor by brilliant shows and spectacles in the amphitheatre, and kept the Prætorians from revolt by bribery, meantime reigning as a disgrace to the royal dignity. Perhaps nothing in political history is so significant as the Senate of Rome voting to this lunatic who had perpetrated awful cruelties and almost unspeakable crimes *divine honors* and the added names, Pius and Felix. He was finally put to death by members of the imperial household who found that they themselves were soon to be the victims of his insanity, so they anticipated his designs.

Commodus was followed by the so-called "barrack emperors." The designation is due to the fact that they were elected by the army who, in nearly a century (192-284), chose 25 emperors, of whom 21 were murdered. Between them and the invading barbarians on every side, Rome sank rapidly into decadence. Greek intellect still maintained its primacy and one of the great men of the century is Galen of Pergamum, who spent some years at Rome as the physician of Marcus Aurelius. He was an indefatigable worker, who wrote hundreds of works on medicine of which 83 remain. He was one of the most observant physicians who ever lived and his works are a mine of acute clinical observation. He suggested that phthisis was best treated by fresh air and good food and that the best food was milk and eggs. He was long the supreme authority on medicine and especially during the Middle Ages his dicta were accepted as almost infallible. The de-

velopment of medicine in modern times has made us realize how fortunate it was that the mediævals should have chosen so safe and sound a guide in medicine, though their reverence for him used to be set down rather as a fault than a virtue.

The two noteworthy victims of Marcus Aurelius's persecution of the Christians were Justin Martyr and Polycarp. Justin owed his conversion to the effect produced upon him by seeing the Christians suffer tortures and death so bravely. He had been a deep student of Plato and after his conversion he wrote the well-known *Apology for Christianity* and subsequently a second one and a *Dialogue with the Jew Tryphon*. These contain many autobiographical details. Eusebius mentions apologetic works addressed to Antoninus Pius and Marcus Aurelius. Justin suffered martyrdom under the prefect Rusticus (circa 165). His writings have continued to exert a deep influence on Christianity all down the centuries and as a very early witness he is of great significance. Of high, pure soul, in the midst of the paganism of the time, he found himself compelled, when brought in contact with Christianity, to admire the superhuman constancy it gave. He was taken by its pure moral teaching, and then after he had acquired knowledge of it was forced to accept its truth. His life and martyrdom are a supreme tribute to early Christianity.

The other victim of Aurelius' persecution was Saint Polycarp (69-155), who is often said to have known in his youth John the Evangelist and to have been deeply influenced by him. John lived on to the age of Trajan, so that Polycarp is the 2d century link with the Apostles. The old man was 86 when he was apprehended. His flock had hidden him and succeeded for years in keeping him from seizure. The proconsul urged him, when he was brought before the multitude in the Stadium, to curse Christ and save his life. Polycarp made his famous reply: "Fourscore and six years have I served Him and He has done me no harm. How then can I curse my king that saved me?" It was too late in the day to throw him to the wild beasts, the sports being over, so it was resolved to burn him, and the populace collected the wood for the fire. His career is just a typical example of a kindly old Christian who, in their superstitious desire to appease their gods so that Roman good fortune might return, was put to death by the mob.

Many of the Romans of the 2d century were very wealthy and not all of them spent their money foolishly or for merely personal pleasure. Some of them found a special pleasure in erecting magnificent structures for the adornment of the cities in which they lived and for the benefit of their fellow-citizens. Theatres, baths, temples and triumphal arches were often erected by the cities themselves, sometimes with the help of generous contributions from wealthy citizens. Aqueducts, bridges, fountains and other monumental works of definite public utility were also constructed through imperial or private beneficence. Some of them remain down to the present day or sufficient remains of them are left to enable us to appreciate how good was the taste and how fine the execution of such structures. One of the wealthy men noted for such beneficence was Herodes, surnamed Atticus, who enriched his native city,

Athens, with a large number of structures, but particularly a huge marble stadium capable of accommodating the entire population of the city. He is said to have given over half a million of dollars in our values to aid the city of Troas in Asia Minor to build an aqueduct for the bringing of pure water into the city.

These beautiful buildings came in the midst of serious intellectual decadence. Magnificent theatres were erected in many places and yet no dramatic literature was written that has proved worthy of preservation. The older Greek plays were given occasionally for those who might be interested in Greek, but as a rule what attracted people to the theatre was shows of various kinds, "dancing girls, music and a spectacle." Ovid, in the preceding century, had declared that women went to the theatre much more to be seen than to see. Cicero had complained even in his time that the spectacle at the theatre had replaced the drama and was so elaborate that, as he writes to a friend, "it left no room for cheerful enjoyment, and I think you will feel no regret at having missed it. What is the pleasure of a train of 600 mules in Clytemnestra, or gay colored armor of infantry and cavalry in some mimic battle? These arouse the admiration of the vulgar; to you they would have brought no delight." The theatre grew worse, not better, and mere farces became the favorite plays of the 1st century, degenerating still further in the second. Beautiful theatres became, then, the scenes for only rough horseplay, the adaptation of the harvest amusements of the countryside, often with improvised dialogue and local hits and satires on the authorities, with interludes of music and dancing, but without anything approaching literature. The pantomime without words became a favorite and the city populations were losing both virility and intelligence. Above all, dancing girls imported from the various countries came to stimulate the jaded senses of the Romans and to show Roman women how to attract the attention of the men. The music and the dancing had no intellectual interest, but it had a sensual appeal, and that was what was sought. People were living for their senses and their bodies, as practically always happens when riches with luxury come to humanity, but had no intellectual interests worth while talking about. The 80 years under the Spanish Cæsars are the most peaceful years of the Roman Empire, and Gibbon has suggested that they are the happiest years of human existence, but such happiness evidently is not a source of intellectual achievement. Latin literature was very largely influenced during the latter part of the 1st and the beginning of the 2d century by the Spanish writers, the Senecas, Lucan, Martial, Quintilian, and in the 2d century by African writers. With the exception of Pliny, born at Como, whose letters are valuable for style as well as for matter, only those born out of Italy had any stimulus to write. Professor Wilkins suggested that "the language which had been unduly refined and elaborated now relapsed into a tasteless and confused patchwork, without either harmony or brilliancy of color." 'Apuleius' *Golden Ass* is the one book from this time that is read in the modern time, but entirely because of its erotic interest. Melancthon is hardly too severe on the style of the book when he says that "Apuleius brays like his own ass." Aulus Gellius, the gram-

marian, writes better, though not much, and only the lawyers of the time seem to have known how to write Latin. Gellius is the last of the so-called Latin classics. The true literary tradition was lost. The century had, however, a number of Greek writers whose names and works deserve to be recalled. Ptolemy, the astronomer after whom the Ptolemaic system was named, and Lucian, the writer of satires, are the best known. Diogenes Lærtes, the Greek historian, and his colleagues, Arrian, Appian and Pausanias, are often referred to.

The most serious popular interest was the amphitheatre, where the gladiators fought with each other or with wild beasts, sometimes unto death. The people who sat on the benches lacked the courage to keep back the barbarian invasion already beginning, but they liked to be thrilled by the sight of blood and of bravery in others, and have the ultimate emotion of seeing people die. Rome set the fashion which was followed enthusiastically in the great amphitheatres built in so many of the cities of the Roman world. The special delight of the populace during the persecutions, and a state of persecution existed almost continually during the century, was to see the Christians thrown to the wild beasts. After a while some of them objected because the Christians went to death so calmly and made no resistance, though occasionally, of course, some timid soul lost confidence and escaped martyrdom at the last moment by offering incense to the gods or perhaps ran screaming toward the barrier when it was too late for rescue and the beasts intercepted him. Such incidents furnished some variety to the otherwise monotonous spectacle of seeing men and women and little children devoured by the wild beasts, but it must not be forgotten that the people who crowded to see such spectacles were not in any sense of the word barbarians, but on the contrary, as a rule, refined, well-dressed, educated Roman citizens, who bathed every day, often several times, had beautiful art objects in their homes, who ate many course dinners and sometimes had a country house as well as a city home, and who knew the classical Roman literature and often not a little about Greek literature.

JAMES J. WALSH,

Author of 'The Thirteenth Greatest of Centuries.'

PRINCIPAL EVENTS OF THE SECOND CENTURY.

117. Trajan, Roman emperor, dies and is succeeded by Hadrian who limits the Roman Empire at the Euphrates.
121. Caledonians drive the Romans out of Scotland. Hadrian builds the wall from the Tyne to Solway Firth to keep them out of England.
131. Revolt, massacre and exile of the Jews. Galen, the celebrated physician, born.
138. Completion of the Pantheon and Hadrian's Tomb at Rome.
145. Antoninus Pius begins a reign of peace and prosperity for 23 years.
155. Martyrdom of Polycarp at Rome.
161. Marcus Aurelius succeeds Antoninus Pius.
163. The bubonic plague ravages Europe. The Christians persecuted.
165. Justin Martyr put to death at Rome.
166. Rome sends an embassy to China, to establish a trade in silk.
180. Commodus begins to reign. Goths, settled on the Vistula and Oder, take possession of the coast of the Black Sea.
194. Commodus assassinated; Septimius Severus succeeds after the short reigns and assassinations of Pertinax and Didius Julianus.
196. Capture and destruction of Byzantium by Septimius Severus.

SECOND SIGHT, an extraordinary power of vision, mental or physical, real or imaginary, believed to be possessed by certain individuals. This belief, by many held to be superstitious, but by not a few regarded as having a basis in the natural laws of mental and sensuous perception, once prevailed throughout the Scotch Highlands and the Hebrides, where it has now almost wholly disappeared together with the belief in the Brownie or in the Greonach, the "Old Longbeard," and with the general use of charms and incantations. Like that superstition, however, it still lingers in retired nooks of the Highlands and of the Western Isles. Second sight, called by the Scotch Gael *taish* (Irish Gaelic *taise*, fetch, spectre), is recognized by many eminent students of psychic phenomena as a faculty possessed by many persons whereby they have vision (or other sense-perception) of persons and occurrences at distances far transcending the range of normal vision or hearing. Dr. Samuel Johnson's definition of second sight and his illustrations of its phenomena are exact and without prejudice; he left the Western Isles deeply impressed with a philosophic curiosity regarding this mysterious faculty, not believing but only "willing to believe"; he could not "advance his curiosity to conviction." "The second sight," he writes, "is an impression made either by the mind upon the eye, or by the eye upon the mind, by which things distant or future are perceived, and seen as if they were present. A man on a journey far from home falls from his horse; another, who is perhaps at work about the house, sees him bleeding on the ground, commonly with a landscape of the place where the accident befalls him. Another seer, driving home his cattle, or wandering in idleness . . . is suddenly surprised by the appearance of a bridal ceremony, or funeral procession, and counts the mourners or attendants, of whom, if he knows them, he relates the names, if he knows them not, he can describe the dresses." It is seen that though *taish* means spectre, ghost, it means also phantasmal appearances of living persons and material objects — "phantasms of the living," as second sight of persons at a distance is called by the Society for Psychical Research. Dr. Johnson's reply to the objections of those who held second sight to be purely a delusion was that the thing was wonderful only because it is rare; considered in itself, he says "it involves no more difficulty than dreams, or perhaps than the regular exercise of the cogitative faculty." Particular instances have been given, with such evidence, as "neither Bacon nor Bayle has been able to resist"; and the second sight of the Hebrides implies only the local frequency of a power which is nowhere totally unknown." ('Journey to the Hebrides,' Philadelphia 1810, 184 sqq.) Walter Scott's opinion of the reality of second sight was that "if force of evidence could authorize us to believe facts inconsistent with the general laws of nature" — as ascertained by him — "enough might be produced in favor of the existence of the second sight." Modern psychology has less fear of the overturning of the laws of nature by the admission of the power of second sight. The finally decisive word of psychological science upon the reality of this faculty has not yet been pronounced.

SECONDARY ENRICHMENT, a process of weathering chiefly effective on sulphide (q.v.) ores, whereby the ore is rendered much richer than it was when originally deposited. The process is largely the result of the affinity of oxygen for the sulphur of the sulphides. Above the water table (q.v.) the pores of the rock are easily permeated by the atmosphere and oxidation can readily take place. Any iron sulphide present is weathered to the oxide limonite which is very insoluble and remains behind in the upper part of the vein as an iron stain known as the Gossan, or Iron Cap. Sulphides of copper, zinc and other metals oxidize to soluble sulphates. These may in part be further altered, especially where the wall rock is limestone, and form carbonates or other compounds, which may remain in the oxidized zone or gossan above the water table. But since the sulphates are mostly very soluble they are usually carried down by the water to or below the water table, where by certain reactions with other sulphides present they are reprecipitated as sulphides. This is then a place of enrichment, where the vein has the metal it originally carried, and also that leached down from above. It is known as the enriched zone, or the secondary sulphide zone. Below this is a zone where the vein is of the original composition. This is known as the lean sulphide zone.

SECONDARY ROCKS. (a) Rocks formed during the secondary or Mesozoic Age of the earth. In this sense the term is rarely used now. (b) Rocks resulting from the alteration of other or primary rocks; among these are gneisses, schists, greenstones and rocks generally formed through metamorphosis, whether static, dynamic or thermic. Clastic rocks, being derived from originally deposited rocks, are also secondary, as are also in the strictest sense all non-clastic rocks which have resulted from the fusion and recooling or solution and reprecipitation of older rocks, that is, stalactites, silicious or calcareous tufts, etc. See **SEDIMENTARY ROCKS**.

SECRECY OF BALLOTS. See **BALLOT**.

SECRET SERVICE, United States, originally, a department or bureau of the Treasury Department, organized in 1864, and having 28 secret service districts throughout the country. The bureau was not originally created by law, nor recognized by Congress by special expense appropriations. While its duties are not definitely defined, the work of the bureau until recent years was largely the detection of counterfeiters, moonshiners, smugglers and other criminals who attempt to defraud the United States Treasury. During the Civil War the bureau was by necessity made an important branch of government service, the chief being a military officer with the rank of brigadier-general of volunteers. The assassination of President Lincoln brought about a more careful guarding of the person of the chief executive, and since 1865 secret service officers have invariably accompanied the President upon his journeys and during his absence from the White House. And since the shooting of President McKinley, secret service men have increased their vigilance in guarding. While certain trained secret service officers are detailed for this work, others are stationed in

foreign countries, and a number of so-called revenue officers are constantly engaged in Kentucky, Indiana, Tennessee and other States, detecting the illicit distilling of liquor and bringing moonshiners to justice.

Counterfeiters.—The bulk of the work of the bureau for many years before the war has been the detection and punishment of counterfeiters. John E. Wilkie, chief of the service, in 1899 said: "Certainty of swift detection should perhaps prevent counterfeiting, but so long as there is a gambler's chance of escape, there will be found those who feel sure they can succeed where others have failed. Hence the necessity for the secret service branch of the government. And as the making of spurious money is a fascinating enterprise for a cunning rogue, so the checkmating of that same rascal in the countless schemes devised to yield an illegitimate fortune is a game of absorbing interest to him who plays it. The liberty of one, perhaps the life of one or the other, are the stakes in this battle royal. The advantage lies first with the law-breaker. He plans and works in secret for months and sometimes years; then stealthily, through trusted channels, the product of his labor is marketed and bad money is quickly turned into good. But work as he may, some imperfection in his spurious bills which has escaped him one day arrests the glance of the keen-eyed money handler. Familiarity with the characteristics of genuine money results in the involuntary detection of a counterfeit. No two cases are ever exactly alike, for the counterfeiter is a fertile fellow, and is a constant student and inventor of precautionary measures that he feels certain will insure his safety."

In the investigations made by the division, the chief has constantly before him the exhaustive daily reports of each man in the service, and a careful weighing of the various points submitted by operatives working often at widely separated localities will frequently suggest a move in the right direction. The gravity of the crime makes progress slow, for no step is taken till facts are established to warrant it. It is always considered desirable to so arrange the final act in this drama that the criminal may be taken wholly by surprise. There is a sort of momentary paralysis following the shock of sudden disaster, and when a raid is properly planned the chances of serious resistance are minimized. Occasionally it happens that it becomes necessary for a deal to be made directly with the handlers of spurious money, and in these cases it takes a man of nerve and keen wit to bring it to a successful issue. Such transactions are always fraught with great personal danger.

Informers.—There is small encouragement for the private citizen to aid the government in the arrest of counterfeiters as the following circular will show:

U. S. TREASURY DEPARTMENT,
SECRET-SERVICE DIVISION,
Washington, D. C. —————

The general principles governing the action of this division in presenting small gratuities of money as an expression of its thanks to persons who perform meritorious service in bringing counterfeiters to justice are:

- 1st. Expenses incurred or services rendered in detecting crime against the United States, when unauthorized by this division, are not reimbursed or compensated by it.
- 2nd. As all United States officers are expected to aid in the suppression of crime against the United States when their attention is directed to any specific violation of law,

this class is excluded from receiving the gratuities awarded by this division.

3rd. All persons not of the foregoing class, who arrest and procure the conviction and sentence of a counterfeiter, or whose evidence is regarded by the prosecuting attorney as having been more material in the case than that of any other witness, upon application, in writing to the office of the Chief at Washington, D. C. (accompanied by a certificate from the prosecuting officer, which certificate should set forth the docket-record of the case, and state that the applicant is the meritorious person through whose agency a conviction of the counterfeiter was procured), will, if approved by the Assistant Secretary of the Treasury, receive a gratuity, the amount to be graded by various considerations—such as, the ability for mischief, and the antecedents of the person arrested and convicted; the length of the term of imprisonment for which he is sentenced; the quantity and character of counterfeit money and counterfeiting material captured with or through him.

No application for a gratuity in any case will be considered until all the counterfeit money and counterfeiting material connected with the case have been expressed to this office. (Express charges C. O. D.)

There are no blanks for use of such applicants. Persons in making application should state fully the service rendered for which a gratuity is asked.

In order to avoid errors and trouble, it should be the practice of all informers to put themselves in communication with operatives of this division, advising them of every movement. As a matter of protection in their rights, this course is indispensable, for an operative is bound to communicate daily to the office of the Chief all information he gains, so that his records, and those at headquarters, stand for the justification of the informer whenever he avails himself of their facilities.

In the absence of an agent of this division, informers should confer with United States Attorneys, Marshals, Commissioners, Collectors of Customs or of Internal Revenue, who will gladly advise with them on such matters.

This circular is not intended to give the holder any authority to act for the Secret Service Division of the United States Treasury Department.

CHIEF.

Statistics.—The reports of William J. Flynn, the chief of the secret service, to the Secretary of the Treasury show that about 400 arrests are made annually. Of this number one-half are of persons manufacturing, passing or having in their possession counterfeit silver coin. The greatest activity of the counterfeiters was in 1896, when a total of \$757,531 in notes and \$10,678 in coin was captured. Since then the normal yearly find runs between \$20,000 and \$50,000 worth of notes and \$10,000 to \$25,000 worth of coin. The number of counterfeit printing plates captured which was 935 in 1895, in recent years is usually below 100. In 1916 of 417 arrests for counterfeiting 229 were convicted, 19 acquitted, 55 released for cause and the remainder awaited trial. California and Texas furnished the most delinquents.

The department has estimated that the average of counterfeit coin in circulation is three dollars in every \$100,000, and of paper one dollar in \$100,000.

There is to-day, as part of the Federal government, a new secret Service, which is larger and more powerful because of the greater latitude it is given in its work. Its duties take its agents to all points of the world. It is authorized to act for every branch of the government, and to handle all manner of cases of violation of the Federal statutes. It has come into being only in recent years, yet it employs more secret agents, spends more money, performs a greater variety of service, than has any other such body of men. It is under the Department of Justice, and its province is to gather evidence in all manner of cases that this department represents before the courts. Anti-trust prosecutions, violations of the national banking laws, land graft, bucket shop frauds, night riding, smuggling, peonage, white slavery, and above all treason against the United States

come under its jurisdiction. In the work of all the departments it takes hold where investigations point to crime. There are investigating bureaus in most of the departments. These amass facts and figures but no evidence. The province of the new secret service is to procure evidence admissible in court in any case where the government may appear as the prosecutor. The force numbers several hundred and is supported by Congressional appropriation.

In the Philippines.—In the Philippine Islands there are 25 employees of the Secret Service Bureau under charge of a chief, since the organization on 7 Aug. 1901 of the Manila district. Previous to that date the department was under the jurisdiction of the military authorities, when the duties performed consisted of general secret service work incidental to the military occupation of a foreign country, namely, to detect and frustrate plots against the government, locating and arresting insurgent leaders and the capturing of insurgent records and munitions of war, as well as performing all the criminal work necessary. At this time, the country being under martial law, arrests were made under that authority, without the application of civil process, simplifying to a great extent the duties of the secret service agents as compared with the present. As the insurgent army disbanded, great numbers of its officers and soldiers came to Manila, and as they had done nothing but soldier for many years, they were not disposed to settle down immediately to peaceful vocations, and were willing to engage in any pursuit that did not demand any mental or physical exertion. During the early days of American occupation, and while the Bilibid prison was still in charge of the Spanish authorities, great numbers of prisoners of the worst class effected their escape, and although the secret service office continually located them and returned them to prison, the majority remained at large. The Manila office maintains a correspondence with the other large cities of the Orient and the United States with reference to criminal information. There are on file about 3,000 photographs of convicted criminals of all classes and nationalities, together with a complete description of the same, and the records contain information pertinent to every political and criminal case which has ever come under the supervision of the Secret Service. The Post Office Department also maintains a secret department, though it is not so called, being named inspection department. Its duties are to protect the public against frauds carried on through the mail.

SECRET SOCIETIES have existed in all ages known to history, and among all classes of mankind, except, perhaps, savages of the very lowest type. In the ancient world they were chiefly religious, or at least professedly so, but in ancient times religious and temporal power were so closely associated that it was difficult, if not impossible, to draw a dividing line. There were the mysteries of Osiris and Serapis in Egypt, of Orpheus and Dionysus in Greece, of Cybele in Phrygia and of Mithras in Persia, all of which tended to surround the worship of the gods with elements of secrecy and awe, which appealed to the conscience and imagination of men, and helped to keep the ignorant multitude in submission to the hierarchy and

all that it represented. The tendency of ancient religions, in all countries, was toward secrecy and mysticism, and it was not easy to obtain admission to the inner circle of the elect. Once admitted, however, as a participant in the mysterious rites, the initiate became one of a fraternity whose influence was felt in every walk of life, and whose power even the most despotic tyrant did not care to defy. In ancient Egypt there were secret organizations, which taught the Eleusinian mysteries (q.v.), and among mystics to-day there is evidence of the influence of this secret body. Among Jews as well as Gentiles secret societies held potent sway. The Essenes (q.v.) were a religious sect, devoted sincerely to the purer life which the Pharisees, with less sincerity, professed, and their asceticism was attended by a large degree of mysticism. It has been claimed that Jesus Christ was a member of the Essene order. The Cabalists were successors of the Essenes, and also had their mystic practices and secret signs, and the Christian Gnostics were an exclusive sect with occult ceremonies and teaching.

In the Middle Ages the secret courts of Westphalia were practically vigilance committees, bound to secrecy by the very object of their existence. The Knights Templar were a secret order, although there is no trustworthy evidence that they were guilty of the practices alleged against them as a ground for the suppression of the order, and the seizure of its wealth.

The Freemasons originated in the combinations formed by operative masons in the Middle Ages for self-protection while they were building the cathedrals and other great structures which excite the admiration of the modern world. It is generally believed by students of antiquity that the origin of the order rests on a still more ancient body from which it sprung. Speculative Freemasonry, as it is called, was based on the more ancient form, and found in it a useful groundwork for the vast organization which has spread over the globe, and has its members in every class, from emperor and king to the toiler who works for his daily bread.

The secret societies which have arisen within the 19th century have been chiefly political and benevolent. The struggle for freedom in Italy gave birth to powerful secret organizations, which continued to exist after Italian unity had been gained, and have caused, at times, much anxiety to the authorities. Ireland has also had and still has a number of secret political societies, including the United Irishmen, the Fenians, the Orangemen and other orders of the past and present. In Russia the revolutionary society known as Nihilists (see NIHILISM) has slain one tsar, and is an ever-present menace to autocratic government. In China secret societies pervade every class of the population; some of them are continually hatching rebellion, and one of them, known as "Boxers," caused the attack on the legations at Peking, which provoked Europe and Japan to severe reprisals.

Coming down to modern American secret societies, we find that they divide naturally into groups. Many are concerned with political or semi-political movements, as the United American Mechanics and the Knights of Labor; others are of religious character, as the Rosicrucians, and various alliances and leagues within the several denominations; others foster

temperance or some moral issue, as the Good Templars; others are fraternal, and have generally insurance features, as the Odd Fellows (q.v.) and Eagles (q.v.); others are approximately fraternal, as the Greek letter societies (q.v.) of the colleges; others grow out of trade alliances, as the ancient guilds and modern trades unions; the military also have their secret societies, of which the most conspicuous is the Grand Army of the Republic (q.v.) now being fast decimated by death, but surviving in the Sons of Veterans (q.v.). With very many of these there is little or no need of secrecy, and it is maintained largely to avoid the nuisance of visitors not in harmony with their work, or simply because they have become used to it, and it is hard to change custom.

The famous Tammany Society of New York, less generally known as the Columbian Order, dates from 1789, being only a fortnight younger than the republic itself; it was based on an earlier secret society, the Sons of Liberty of Maryland, one of those bodies that had to be conducted largely in secret, as developing the spirit that culminated in the Revolution of 1776. Tammany is now a wholly political body, within the Democratic party. (See TAMMANY). The Independent Order of Red Men (q.v.) developed from the same parent stock as Tammany, but along radically different lines of fraternity. It is one of many important societies, described and enumerated under the title of 'Fraternal Societies in America' in this Encyclopedia. A number of organizations have grown up in opposition to the spread of political activity of Roman Catholic societies. Early among these were the United American Mechanics (q.v.), the American Protective Association (q.v.), better known as the A. P. A., Sons of Seventy-Six, Order of the Star Spangled Banner and more recently Guardians of Liberty. Their policies have been directly opposed to those of the Ancient Order of Hibernians (q.v.) and the modern Knights of Columbus (q.v.). The Sons of Temperance (q.v.) is the earliest organization noted interested in this work, having been founded in 1843. It was later followed by the Independent Order of Good Templars, which had a vast following in 1875-85, but declined when Prohibition became prominent. A large number of the more important secret societies will be found under their respective titles.

There seems to be no doubt that secrecy of organization in America is on the wane, as the trend of public thought is toward publicity. Secrecy is a relic of the times when men were not permitted to think and act for themselves, and had to avoid domination. It is safe to assert that there is not an organization to-day in the United States, where secrecy is regarded as of great importance, even Freemasonry (q.v.) making public a great deal of its work and doings. The fact that so many secret organizations retain very large memberships seems to be due, not to the secrecy, but to their having engaged in useful or fraternal work, and having a mission to accomplish. There are secret societies that are bad, however. Of such societies with evil purposes, the most noted is the Mafia (q.v.), of Italy, which is said to have been introduced into the United States with the large Italian immigration, and to which many

crimes have been ascribed. The Molly Maguires were a society in the Pennsylvania coal regions, about 35 years ago, organized for the objects of terrorism and murder. It was suppressed by a relentless prosecution on the part of the State, and the execution of the leaders. Consult Heckethorn, 'Secret Societies of All Ages'; de la Hodde, Z., 'Secret Societies of France'; Frost, 'Secret Societies of the French Revolution,' etc. See SOCIETIES, CRIMINAL; KU KLUX KLAN; ESSENES: FRATERNAL SOCIETIES IN AMERICA; MASONIC FRATERNITY; ODD FELLOWS, and other secret societies under their respective titles.

SECRET SOCIETIES, College. See GREEK LETTER SOCIETIES.

SECRETARIAL EDUCATION. The distinction between the secretary and the stenographer is not sharp. The duties of the two frequently shade the one into the other. The stenographer of course has distinctive abilities. He knows some system of shorthand, he is a typist and he can transcribe his shorthand notes on the typewriter. The secretary, on the other hand, while he will find these abilities of the stenographer useful, will find that they are only a small beginning of what he needs. In fact the secretarial range of usefulness is very wide, too wide to be wholly comprehended in a single course of training. It is advisable to consider secretarial education under two heads, general or preparatory education and technical or special education.

Whether we have in mind the general or technical training it is necessary to classify the secretarial work. We may distinguish between the private or personal secretary and the institutional or organization secretary. The latter is a person who records the minutes of meetings of boards of trustees, boards of directors, committees, etc. This type of secretary needs very little technical training but should have a good general education. The private or personal secretary may be a social, educational, literary, political, ecclesiastical or business secretary, according as he serves a person engaged in any of these professions or occupations. The word secretary has its best application only in this sense, signifying a person who has charge of the *secreta* (secrets) of his employer.

Secretarial education presupposes a thorough high school or other secondary school course. After this preparatory training follows a liberal education with major emphasis on the particular field in view. The prospective social secretary gives major emphasis to philanthropy, history, art, literature. The prospective educational secretary centres his major interest on comparative education, educational administration, the philosophy of education, history of education, etc. The literary secretary must have literary taste, a knowledge of style and a wide acquaintance with the world's best literature. The political secretary will need thorough acquaintance with history, economics, sociology, law, etc. The ecclesiastical secretary must add to a liberal education a knowledge of church polity. The business secretary must lay emphasis on economics, geography, industrial history, commercial law, accounting, sociology and psychology. It is clear that the best results can be obtained only when the general

education has consciously aimed at the particular field in which the secretarial duties are to be performed. Without such general education the secretary remains merely a clerk or a stenographer.

Secretarial education in its technical or specialized form should, therefore, be assigned to the last two years of the regular college course or, preferably, it should be a graduate course. With collegiate courses as a background, this technical training can be given in one or two years. It should offer the following features: Applied psychology, correspondence, business organizations, office management, filing systems, publicity methods, library methods, including cataloguing, business law, finance, stenography, typewriting.

History of Secretarial Education.—Business colleges have undertaken the training of secretaries but they have been unable to command the best standards of preparation or of training. They admit as students persons who have had less than a grammar school education. Their product is, therefore, defective in the use of English, frequently inaccurate in the use of ordinary office machinery, and wholly unprepared for the secretaryship as outlined above. The best business college product furnishes good material for stenographers.

High school commercial departments are rapidly entering this field. Their entrance requirements are higher and they give a broader training in language, history, science, etc., but they often fall short of thoroughness in the mechanics. That is, they give insufficient time to secure the necessary speed and accuracy in stenography and typewriting. The high school commercial product at its best approaches a secretarial standard but falls far short of the best conception of the secretaryship.

Both the business college and the high school commercial department are temporary means for meeting an ill-defined need. As the secretarial definition becomes clarified, the demand grows for a higher type of training. Colleges are adding secretarial courses and several universities are offering advanced courses in Business Administration. Among them are Simmons College, Harvard, Yale, New York University and others. A typical undergraduate secretarial college course is the following: *Freshman year:* English, French, German, history, hygiene, physics, filing. *Sophomore year:* English, French, German, history, penmanship, stenography, typewriting. *Junior year:* Business law, economics, English, stenography, typewriting, French, German, history, sociology. *Senior year:* Accounts, business methods, commerce, commercial teaching, economics, education, English, French, German, government, history, sociology, Spanish. A typical graduate course, open only to students who have already earned the bachelor's degree, is the following: Accounts, administration, business practice, stenography, typewriting, business law, library practice, commerce.

A. R. BRUBACHER,

President, State College for Teachers, Albany, N. Y.

SECRETARY-BIRD, or SERPENT EAGLE, a remarkable raptorial bird (*Serpentarius secretarius*) of South Africa, representing alone the family *Serpentariidae*, associated

with the vultures. The general aspect of the bird is that of a long-winged, long-tailed, gray-and-black hawk mounted upon very long legs, so that as it stalks across a plain it might easily be mistaken for a crane. It runs with the speed of a horse and will fly when forced to do so, and may soar to a considerable height. It builds a big substantial nest in some bush or tree and reoccupies it from year to year. Their food consists of small animals and reptiles of all sorts, and especially of snakes, which it kills with a powerful forward kick, or, if the first stroke is not effective, repeats it with feet and knobbed wings, actively dodging the serpent's lunges, until the reptile is disabled or dead. These birds are frequently tamed and kept about the farmyard in South Africa as vermin destroyers. They take their name from the tufts of erectile feathers growing on each side of the head, which suggest a bunch of pens stuck behind a clerk's ear: the Arab name means "thirty ears." Consult Evans, 'Birds' (New York 1900).

SECRETARY OF STATE, an officer whose business is to superintend and manage the affairs of a particular department of government. In the United States the Secretary of State has entire charge of foreign affairs, consular agencies and diplomatic matters. He is a member of the President's Cabinet and is usually considered the principal adviser to the chief executive. In Great Britain there are five secretaries of state, namely, those for the Home, Foreign, Colonial, War and Indian departments. The Secretary of State for the Home Department has charge of the privy signet office; he is responsible for the internal administration of justice, the maintenance of peace in the country, the supervision of prisons, police, sanitary affairs, etc. The Secretary for Foreign Affairs conducts all correspondence with foreign states, negotiates treaties, appoints ambassadors, etc. The Colonial Secretary performs for the colonial dependencies similar functions to those of the Home Secretary for the United Kingdom. The Secretary for War, assisted by the commander-in-chief, has the whole control of the army. The Secretary for India governs the affairs of that country with the assistance of a council. Each secretary of state is assisted by two under-secretaries, one permanent and the other connected with the administration, with numerous subordinates. The Chief Secretary for Ireland is not a secretary of state, though his office entails the performance of similar duties to those performed by the secretaries of state. In 1885 the office of Secretary for Scotland was revived; he exercises in Scotland many of the powers and duties of the secretary for the home department, but has no cabinet rank by virtue of his office. The Secretary to the Admiralty is a subordinate member of the government, always a member of the House of Commons, in which he represents the Admiralty when the First Lord of the Admiralty is a peer. A secretary of embassy, or of legation, is the principal assistant of an ambassador or envoy.

SECRETION, the process whereby certain structures — glands or membranes — elaborate, separate or secrete, from the common medium presented by the blood, definite and specialized products destined either for use in the economy

of the body, or for being sent out of the organism. In this way the process of secretion subserves a double function, or exhibits a double aspect, inasmuch as it not only manufactures products for home consumption, as it were, but provides also for the removal of waste matters from the body. Substances or products elaborated for the use of the organism are named secretions. Products secreted only to be discharged from the organism are called excretions. Take the liver and its bile as an example of a true secretion destined — primarily, at any rate — for use in the body, that is to say, in the process of digestion and elaboration of food; then as an illustration of the excretory form of the process, observe the kidneys and their secretions, these organs secreting from the blood urea, carbonic acid and other products which, in the form of urine, are destined to be discharged sooner or later from the body. The work of secretion is thus primarily seen to be among the most important of those actions the perfect performance of which contributes to the welfare of the organism; and interruption to the secretory processes results necessarily in the induction of disease of more or less serious kind. As both secretions and excretions are poured out from the secreting organ either upon the outer surface of the body or into some of its internal channels or ducts, it would appear that the two processes are identical in their ultimate aims and ends.

But true secretions (for example, bile and milk) consist of substances or compounds which, as such, do not exist in the blood, but demand a process of elaboration in the glands or secreting structures for their due and perfect formation. Excretions, such as the urine, consist of substances which exist in the blood in a form somewhat related to the final product. The elements are collected and thrown out more or less as such. Secretions exist *potentially* in the blood, and require for their elaboration definite and special structures. Excretions actually exist in the blood, and demand for their elimination and separation processes more analogous to mere filtering, and less complicated than those demanded by the work of secretion. This latter distinction receives practical confirmation and support from the fact that when excretions are checked in their natural discharge they may appear in their characteristic form in the blood. This result is well seen in cases of suppression of urine through disease or injury of the kidneys. But if true secretions be checked they cannot, under the same or ordinary circumstances, be detected in the blood; and removal of the secreting organ forever prevents the reappearance of the secretion. A pent-up secretion may be reabsorbed by the blood, and be detected in that medium, but this does not affect the grand distinction to be drawn between the actual nature of and differences between the two processes.

The essential structural characters of a secreting surface consist, firstly, of a structureless primary or basement membrane; secondly, of blood-vessels, which bring the blood from which the secretion is elaborated; and lastly, of cells or special structures devoted to the further elaboration of the constituents derived from the blood. A simple membrane, such as a serous or mucous membrane, exhibits the ar-

range of these elementary parts in its simplest phase; while more complicated arrangements of the same essential parts result in the formation of the more definite secreting parts which we term glands. Of these structures, in themselves constituting most of the chief organs or viscera of the body, three great plans may be distinguished, so far as the arrangement of their elementary parts is concerned. Thus the simple tubular glands—well exemplified in the tubular follicles of mucous membranes, in the gastric follicles or glands of the stomach, in the sweat or sudoriparous glands of the skin, etc.—consist of simple tubular involutions or depressions of the membrane which forms them, or with which they are connected. Each consists, therefore, of an open and elongated pouch or vesicle, the wall of which is composed of the primary membrane, while its lining is formed of secreting cells. This primary and elementary form of glands may be complicated by presenting a saccular rather than a merely tubular form, or by having the simple tube developed in a coiled form. The aggregated or conglomerate glands form the second division of gland structures. Such are the true mucous glands of the membranes of that name, the salivary and mammary glands, the prostate gland and the pancreas or sweetbread. These glands exhibit an essential structure composed of rounded clusters of vesicles termed acini, grouped together in various ways, which contain gland-cells, and which open by minute ducts gradually uniting to form the main duct of the gland. These acini or vesicles, as before, are lined by secreting cells. The third variety of glandular structures is that comprised in the idea of convoluted tubular glands. The kidney and the testicle exemplify this latter class of structures. In these glands we find tubules of basement membrane of generally uniform size, presenting a convoluted appearance, and terminating either in blind pocket-like extremities or by dilatations, as seen in the Malpighian corpuscles. (See KIDNEYS.) Sometimes, however, such tubular structures may, as in the testicle, form a loop, and then return along their original course. The tubules are lined by their secreting cells, and in their tortuosity evince a structure which presents a large secreting surface frequently comprised within a very small space or extent.

The exact means or rationale whereby each gland is enabled, from the common medium furnished to all, to elaborate through its own special cells its characteristic secretion, presents a problem from the perfect solution of which physiological science seems as yet far off. The cells of the liver contain bile; those of the mammary gland contain the fatty particles of the milk; and those of the testicle spermatozooids. But it can only be said that cells secrete; of the origin of these secreting powers and of the exact manner in which they are exercised nothing is known; yet that some acute and distinct specialization of the powers of secreting or gland-cells takes place over those of other and ordinary cells there can be no doubt whatever.

The view that secretion and the great process of nutrition (q.v.), to which secretion ministers, are identical is a reasonable and thoroughly consistent opinion. Viewed as mere organs, and apart from all purely functional

considerations, the structure and formation of secreting glands might be regarded as simply processes of pure nutrition.

The greater the vascularity or blood-supply sent or distributed to any secreting organ the greater generally are its secreting powers. But the rate of circulation through a gland, or the mere quantity of the blood itself, cannot be shown to exert any direct influence on its secretory powers. Secretions may be retained for a lengthened period in some glands—such as the testicle—which are only periodically active, or they may be almost continually discharged, as is the case with the secretion of the kidneys. Under stimulation most if not all glands secrete more rapidly and abundantly, but the nature of the stimulation varies in different cases, or may be either of normal or abnormal kind. The discharge of secretions is effected by pressure from behind, while occasionally, as in the ureters and bile-ducts, the pressure of muscular fibres aids in the expulsion of secretions. The particular quality of blood may affect secretion, as at certain times a greater quantity of a particular material may be contained in the blood, the presence of this material stimulating the action of some appropriate gland.

The influence of the nervous system is important in connection with the general conditions of secretion, but much belonging to this topic exists in a still obscure state. It is known, however, that by regulating the supply of blood to a gland the nervous system may indirectly operate in preventing or forwarding the work of any gland, and that through the agency of conditions acting upon the nervous centres and upon the vegetative nervous system, effects are respectively wrought upon the glands. Food in the mouth induces a reflex action (q.v.), which action, produced through impressions made on nerve centres and reflected to the nerves of the salivary glands (q.v.) induces a copious flow of saliva through the stimulation of the glands. Mental conditions alone, and without material stimuli, will excite secretion, as seen in the flow of tears, or in the flow of saliva following the description of dainties; while the sudden stoppage of the milk secretion through fear or sorrow affords an illustration of the same fact. One secreting surface or gland bearing a functional relation to another gland (for example, kidneys and skin) may, through diminished or increased action, affect that other. Consult Bayliss, 'Principles of General Physiology' (2d ed., 1918).

SECTOR (Latin, *seco*, to cut), denotes in geometry that portion of the area of a circle included between two radii and an arc; or, a mixed triangle formed by the radii mentioned and the arc of a circle. Thus ABC contained within the radii CA , CB , and the arc AB is a sector of the circle of which the arc AB is a portion. The area of a circular sector is equal to the product of the arc of the sector by one-half of the radius. If the angle at the centre is given, the length of the arc of the sector may be found, since it is equal to π multiplied by the radius into the ratio of 180 degrees to the number of degrees of the sector. Thus:—

$$S = \pi r \frac{n^\circ}{180^\circ}, \text{ and } A = \pi r \frac{2n^\circ}{360^\circ},$$

for the area.

A spherical sector (the one just described is a circular sector) is a volume or solid that may be generated by revolving a circular sector about a straight line drawn through the vertex of the sector as an axis. The arc of the spherical sector generated the surface of a zone called the base of the spherical sector and the two radii generate the surfaces of the two cones, having a common vertex at the centre of the sphere. The *volume* of the spherical sector is equal to the zone which forms its base, multiplied by one-third of the radius of the sector.

Sector is also used as the name of an instrument employed in practical mechanics. It is sometimes called the sectorial scale of equal parts. It is usually a scale of wood, brass or ivory, consisting of two arms which open by turning round a joint or hinge at their common extremity. On each arm there is a diagonal line drawn through the point about which the arms revolve. These are divided into equal parts, which are numbered from the common point outwards.

The sectorial scale is so marked with lines of sines, tangents, secants, chords, etc., as to fit all radii and scales, and is useful in making diagrams: laying down plans, etc. Its principal advantage consists in the facility with which it gives a graphical determination of proportional quantities. It becomes incorrect comparatively, when the opening is great, or the result greater than the data. The sector is founded on the fourth proposition of the sixth book of Euclid, where it is proved that equiangular triangles have their homologous sides proportional.

This instrument is said to have been invented by Guido Uvaldi about 1568, though Gaspar Mordente of Antwerp describing it in 1584, attributes its invention to his brother Fabricius in 1554. It was described by several German and English writers in the same century, and again by Galileo, who claimed to have invented it in 1604. Frenchmen call it the compass of proportion.

Another instrument, used in astronomical observation, is called sector. A limb of this instrument embraces only a portion of a circle used for measuring differences of declination too great for the compass of a micrometer. This instrument was contrived for the purpose of measuring with great accuracy the zenith distances of stars, and when it is so employed it is called a zenith sector. It was by means of the zenith sector that Bradley discovered the existence and magnitude of two very important astronomical elements — the aberration of light, and the nutation of the earth's axis. The instrument has been at times used in trigonometrical surveys for determining the difference of latitude between two stations. For the difference of the zenith distances of the same star, observed at its meridional passages at two places, gives the difference of the astronomical latitudes of such places without any regard to the star's declination.

There is yet another way in which the word

sector is used. It sometimes denotes an arc-shaped attachment to an equatorial mounting often used for communicating the motion of the driving clock to the polar axis. A driving clock, *obiter dicta*, is a powerful and accurate clock motion used in astronomical and physical investigations to turn an equatorial telescope round its polar axis, so as to hold an object fixed in the field of view; or, for driving a chronograph or other instrument.

SECTS, Religious. See RELIGIOUS SECTS.

SECULAR GAMES, in Roman history, games celebrated at long and irregular intervals, and not, as their name would seem to indicate, once every century. Under the republic they were known as the Tarentine games, from a place in the Campus Martius, called Tarentum, where they were celebrated, and appear to have been instituted about the time of the consul Valerius Publicola. Nothing is known of their origin beyond the fact that they were celebrated in honor of Pluto and Proserpina for the purpose of averting from the state some great calamity. Under Augustus they were revived in 17 B.C. with considerable pomp, occupying three days and nights, and being accompanied by sacrifices to Jupiter, Juno and all the superior deities. For this occasion Horace wrote his 'Carmen Sæculare' in honor of Appollo and Diana, sung by a chorus of youths and virgins. The secular games were celebrated on subsequent occasions, namely, in the reign of Claudius in 47 A.D., in that of Domitian in 88, and in that of Philip in 248, exactly 1,000 years after the building of Rome.

SECULARISM, an ethical system founded on the principles of natural morality and independent of revealed religion or supernaturalism. Its first postulate is freedom of thought — the right of every man to think for himself: this is now admitted, at least in theory, by most Christians; but it was not so when the platform of Secularism was first promulgated about the year 1846 by George Jacob Holyoake in England. Implied in this postulate as its necessary complement is the right to difference of opinion upon all subjects of thought. And this right would be nugatory without the right to assert that difference. Finally, Secularism asserts the right to discuss and debate all vital questions, such as the commonly received opinions regarding the foundations of moral obligation, the existence of God, the immortality of the soul, the authority of conscience, etc. Secularism does not maintain that there is no other good but the good of the present life: with that question it does not meddle: but it does maintain that the good of the present life is a real good, and to seek that is good; and it aims to find "that material condition in which it shall be impossible for man to be deprived or to be poor." In this life there are, it asserts, material agencies which cannot be neglected without folly or hurt, and that it is "wisdom, mercy and duty to attend to them." It does not combat the pretensions of Christianity; does not say there is no light or guidance save in nature; but maintains that "there is light and guidance in secular truth, whose conditions and sanctions exist independently, act independently, and act for ever."

SECULARISTS. See RELIGIOUS SECTS.

SECURITIES. See **BANKS AND BANKING—FUNCTIONS OF BANKS, ETC.**

SECURITY OF PERSON. See **RIGHTS.**

SEDALIA, Mo., city, county-seat of Pettis County and the largest city of the central portion of the State, on the Missouri Pacific and Missouri, Kansas and Texas railroads, 189 miles west of Saint Louis and 96 miles east of Kansas City. Sedalia is the terminal point of four divisions of the Missouri Pacific and of three divisions of the Missouri, Kansas and Texas Railroad, including the main lines and branches. The general car and repair shops of the latter road are located at this point, occupying 37 acres of ground, with buildings and machinery costing \$160,000 and employing 600 to 800 men. In 1904 the Missouri Pacific Railway Company established at Sedalia its general shops for repairs and construction of cars and locomotives for the entire system at an expense of over a million dollars and calculated for the employment of 2,000 men, the citizens donating \$230,000 in money and land as an inducement.

There are numerous manufactories of domestic commodities and several large jobbing and distributing, packing and shipping-houses. There are three national banks, two State banks, and one trust company, with a total capital, surplus and undivided profits of \$850,500; deposits, amounting to \$5,000,000; also two loan companies. The banks operate a clearing-house for the country banks in surrounding counties, clearings amounting to \$1,250,000 per month.

The public buildings include the courthouse, a stone structure, costing \$110,000; city hall, market, government building, engine-houses, etc.; Carnegie library, cost \$50,000; Y. M. C. A., cost \$60,000, 650 members. The public park of 50 acres in city cost \$85,000, with swimming pool, tennis court, nice lake for boating, children's playground equipment, large convention hall that has a seating capacity of 1,500. The Missouri State Fair was located in Sedalia in 1901, and \$1,000,000 has been spent in buildings and improvements. There are 27 churches and excellent free schools. There are a dozen public school buildings, with furniture, libraries, etc., valued at \$350,000; 100 teachers, annual pay roll \$57,000. Besides the public schools are two business colleges, one college for colored students, supported by the Methodist Episcopal Church, and several private and parish schools. The high school has a four-years' course and articulates with the State University.

Public utilities are represented by water, gas and electric companies, with a capital of \$3,250,000, supplying 2,000,000 gallons of water per day, gas, electric light and power; a street railway company, operating nine miles of street railway, also furnishing electric light and power; a steam heating company, all operating under franchises protecting public and private rights; and two telephone companies. The municipal and school elections are conducted the same as the national and State elections; having the two political parties—Democratic and Republican—each party nominates a candidate for each office. The government is vested in the mayor and board of eight aldermen. Other officers are police judge, clerk, marshal, assessor, collector, treasurer and attorney. The total valua-

tion for taxation in 1915 was \$5,733,045, being 40 per cent of cash value. Tax levy for current expense and sinking fund 1 per cent. Total revenue, \$105,179.82. Bonded debt \$172,000, of which a part bears 4 per cent and the balance 4½ per cent. Prior to 1860 the present site of Sedalia was wild prairie. Foreseeing the building of the Pacific Railway, Gen. George R. Smith, a resident of Pettis County, acquired a tract of land in 1856 and 11 Nov. 1857 filed a plat of the town of Sedalia. The first settlement on the town site was in 1860, the railway reaching the place in January 1861. Owing to the breaking out of the Civil War, the westward advance of the railway was delayed, and Sedalia for several years was the western terminus and an important military post and shipping point for the Southwest. The place was held by the Federal troops throughout the war, save for its capture, after a sharp fight, in October 1864, by the Confederate general, Jeff Thompson, who was driven out the next day by Gen. A. J. Smith. The impetus in growth given to Sedalia during the war was afterward continued by its becoming a railway centre of importance, and its growth, though slow, has been constant. Pop. 25,000.

M. V. CARROLL,

Secretary of Chamber of Commerce.

SEDAN, sã-dãn, France, a town in the department of Ardennes, near the Belgian frontier, on the Meuse River, opposite Torcy, and about 160 miles northeast of Paris. Its principal buildings are the theatre, public library and college. The town has important cloth manufactures, employing the majority of the inhabitants. Its chief interest is connected with the defeat of the French army by the Germans, and the surrender of Napoleon III with 100,000 soldiers 2 Sept. 1870. Pop. about 22,000. See **FRANCO-GERMAN WAR.**

SEDAN-CHAIR, so called from Sedan, a town in northern France. A covered chair, cushioned and decorated, used as a vehicle for carrying one person who sits within it, the enclosure being therefore of much greater height than width. It is carried on two poles which pass through rings secured to the sides, usually by two bearers. They were introduced in western Europe in the 16th century, but their use was extended greatly in the 18th century when they were the common means of transportation for ladies and gentlemen in England and France. Similar chairs carried on the shoulders of two or more bearers, have long been in use in China.

SEDDON, James Alexander, American statesman: b. Falmouth, Va., 13 July 1815; d. Goochland County, Va., 19 Aug. 1880. He was graduated from the law school of the University of Virginia and practised law in Richmond. He was a Democratic member of Congress 1845-47 and 1849-51, after which he retired to his estate. In February 1861 he was one of five delegates to the "Peace Congress" at Washington where he maintained the right of a State to peaceful secession. In July 1861 he was a delegate from Virginia to the Confederate provisional Congress, and in November 1862 became Secretary of War in the Confederate Cabinet. This position he held until the Civil War was nearly over, resigning 28 Jan. 1865 and retiring from public life.

SEDDON, Richard John, New Zealand premier: b. Eccleston, Lancashire, England, 1845; d. at sea, 10 June 1906. Emigrating to Australia at 18 he was attracted to New Zealand four years later by the gold discoveries. He sat in the New Zealand Parliament in 1879–81 and 1881–90; later he became minister for defense and public works, commissioner of trades and customs, and finally rose to be premier. By profession he was a mining engineer, and he was an associate of the American Institute of Mining Engineers. He was the body and the soul of the New Zealand government.

SEDGE, a common term indiscriminately applied to the many marshy plants of the family *Cyperaceæ*, and particularly to the genera *Cyperus* and *Carex*. The sedges are grass-like or rush-like herbs with slender stems, generally solid, often triangular, and but rarely swollen at the nodes. The leaves are pointed and narrow (the word "sedge" refers to their cutting edges), with closed sheaths, with or without reduced ligules, and are three-ranked. The flowers are either perfect or otherwise, and are very small, having a hypogynous perianth, generally consisting merely of bristles or scales, with from one to several stamens having slender filaments, and a simple, toothed or cleft style. The fruits are one-celled and are lenticular or three-cornered. The tiny grass-like flowers are gathered into spikelets of one or more, each (or rarely a pair) in the axil of a scale, which may be persistent or deciduous; the spikelets are themselves arranged in various inflorescences, often in conspicuous umbels. The sedges frequent marshy lands, chiefly, and are occasionally useful in binding sea-sands or in contributing to the growth of peat-bogs.

SEDGWICK, Adam, English geologist: b. Dent, Yorkshire, 22 March 1785; d. Cambridge, 27 Jan. 1873. He was graduated at Trinity College, Cambridge, in 1808, became a Fellow there in 1810 and in 1816 was ordained in the Anglican Church. Because of general high ability he was appointed professor of geology at Cambridge in 1818, a chair hitherto something of a sinecure. Sedgwick, however, set at once about acquiring a knowledge of geology that enabled him to raise the chair to one of importance in the university: was one of the founders of the Cambridge Philosophical Society in 1819, through which he greatly assisted the development of the study of natural science; and labored indefatigably to augment the geological collections of the university, often at his personal expense. He continued his duties as a clergyman and made important geological investigations in Wales, Yorkshire, Devonshire, the Lake Country, the Isle of Wight and northern Scotland. He founded the Cambrian and the Devonian systems; but was for long engaged in a controversy with Murchison, whose Lower Silurian system overlapped Sedgwick's Upper Cambrian system. The matter was disputed until the substitution of the term Ordovician after Sedgwick's death. He was president of the Geological Society in 1829–30, and was awarded its Wollaston medal in 1851. He was also awarded the Copley medal of the Royal Society in 1863. As a memorial to him the Sedgwick Museum was opened at Cambridge in 1903. Author of 'Geological Relations and Internal Structure of the

Magnesian Limestones' (1828); 'Discourse on the Studies of the University of Cambridge' (1833); 'Synopsis of the Classification of the British Palæozoic Rocks' (1855), etc. With Murchison he wrote 'Physical Structure of the Rocks of Devonshire' (1839).

SEDGWICK, Anne Douglas (MRS. BASIL DE SELINCOURT), American novelist: b. Englewood, N. J., 28 March 1873. She left the United States when a child and has since lived chiefly in Paris and London. She studied painting in Paris but later turned her attention to literature. She was married in 1908. Author of 'The Dull Miss Achinard' (1898); 'The Rescue' (1902); 'Paths of Judgment' (1904); 'A Fountain Sealed' (1907); 'Tante' (1911); 'The Nest' (1912); 'The Encounter' (1914), etc.

SEDGWICK, Arthur George, American lawyer and editor, son of Theodore Sedgwick (1811–59, q.v.): b. New York, 6 Oct. 1844; d. Pittsfield, Mass., 14 July 1915. He was graduated at Harvard University in 1864, entered the Union army as first lieutenant in the 20th Massachusetts regiment in that year, was taken prisoner and held at Libby Prison. He afterward entered the Harvard Law School and was admitted to the bar in 1866. He then practised law at Boston and was engaged with O. W. Holmes, Jr., in editing the *American Law Review* in 1866–72. He practised in New York in 1875–81, and was contributing editor to both the *Evening Post* and the *Nation* until 1905. He was law lecturer at Lowell Institute, Boston, in 1885–86, and was Godkin lecturer at Harvard University in 1909. He was joint author of 'Treatise on the Principle and Practice Governing the Trial of Right to Land' and author of 'Elements of Damages' (1909); 'Democratic Mistakes' (1912).

SEDGWICK, Catharine Maria, American author, daughter of Theodore Sedgwick (1746–1813): b. Stockbridge, Mass., 28 Dec. 1789; d. Roxbury, Mass., 31 July 1867. She was for many years the principal of a famous school for young ladies, and in her day was widely known as an American novelist. Her best-known works are 'A New England Tale' (1822); 'Redwood,' first published anonymously, translated into four European languages, and erroneously attributed to James Fenimore Cooper; 'The Traveller' (1825); 'Hope Leslie, or Early Times in Massachusetts' (1827); and 'The Linwoods' (1835). Consult Dewey, 'Life and Letters of Catherine Sedgwick' (1871).

SEDGWICK, Ellery, American author: b. New York, 27 Feb. 1872. He was graduated at Harvard University in 1894 and taught at Groton School, Massachusetts, 1895–96. He was on the editorial staff of the *Worcester Gazette* 1896 and *The Youth's Companion* 1896–1900; and from 1900–05 was the editor of *Frank Leslie's Popular Monthly*. After a brief connection with *McClure's Magazine* and with Messrs. D. Appleton and Company, he became editor of the *Atlantic Monthly* and president of the company 1909. In 1915 he was elected member of the National Institute of Arts and Letters. He has published 'Life of Thomas Paine' (1899).

SEDGWICK, John, American soldier: b. Cornwall, Conn., 13 Sept. 1813; d. Spottsylvania C. H., Va., 9 May 1864. He was graduated at

West Point in 1837 and served in the army from that time until his death, taking prominent part in three wars and in many engagements against the hostile Indians in the West. During the second Seminole War in Florida 1837-38, he was second lieutenant of artillery, was promoted in 1839, and took part in the Mexican War 1846-47, receiving promotion for gallantry after Churubusco and after Chapultepec. When the Civil War began he became lieutenant-colonel of artillery and rose to the rank of major-general. Stationed first at Washington, he was afterward commander of brigade, then of division in the Army of the Potomac, being placed in command of the Sixth army corps in 1863. He took part in the battle of Fair Oaks, the Seven Days' Battles; was severely wounded at Antietam, and after a leave rejoined the army in time for Chancellorsville and Fredericksburg. He played a distinguished part at Gettysburg, and in 1864 participated in the battles of the Wilderness and Spottsylvania, at which latter place he was shot by a Confederate sharpshooter during a movement of his troops. A bronze statue of him was erected at West Point in 1868. His death forms the subject of a painting by Julian Scott, now in the public library at Plainfield, N. J.

SEDGWICK, Henry Dwight, American lawyer and author, brother of Ellery Sedgwick (q.v.): b. Stockbridge, Mass., 24 Sept. 1861. He was admitted to the bar in 1884 and was engaged in practice in New York in 1885-98. He has since been occupied with literary work. Author of 'Letter of Father Cuellar' (1896); 'Life of Father Hecker' (1897); 'Life of Samuel Champlain' (1901); 'Life of Francis Parkman' (1904); 'The New American Type' (1908); 'Italy in the Thirteenth Century' (1912); 'An Apology for Old Maids' (1917); 'Dante' (1919), etc.

SEDGWICK, Robert, American colonist and soldier: b. Woburn, England, about 1590; died Jamaica, West Indies, 24 May 1656. He emigrated to Charlestown, Mass., in 1635, being one of the first settlers there; in 1638 he assisted in organizing the Ancient and Honourable Artillery Company of Boston (having received his training in the Artillery Company of London), and two years later became its captain. He rose to the command of the militia, in 1652. With John Winthrop, Jr., he helped establish, in 1643, the first iron works of the United States. Under Cromwell's orders he captured several French ports in the Penobscot region and in 1655 assisted in the capture of Jamaica. Cromwell raised him to the rank of major-general and made him governor of that island.

SEDGWICK, Theodore, American jurist and legislator: b. Hartford, Conn., May 1746; d. Boston, 24 Jan. 1813. He studied at Yale, was admitted to the bar in 1766, began practice at Great Barrington, Mass., and soon removed to Sheffield, where he attained eminence in professional and civil affairs, frequently representing the town in the Massachusetts legislature. At the beginning of the Revolution he entered the Continental army, serving on Gen. John Thomas' staff in the expedition to Canada, and later acting unofficially as commissary. In 1785-86 he was in the Continental Congress, and in the winter of 1787 was prominent in the suppression of Shays' rebellion (q.v.). He was

speaker of the State house of representatives in 1788, and in that year also a member of the State convention for the ratification of the Federal Constitution; from 1789 to 1796 a representative in Congress; and in 1797-99 United States senator, being president pro tem. in 1797. Then he was again in the House, and its speaker until 1801. From 1802 until his death he was a justice of the Supreme Court of Massachusetts, being noted on the bench for the clearness of his opinions. He was one of council who secured a decision (1780) by which such a construction was given to the constitution of Massachusetts as to abolish slavery in that State. He was an active Federalist, and a member of the American Academy of Arts and Sciences.

SEDGWICK, Theodore, American author, son of Theodore Sedgwick (q.v.): b. Albany, N. Y., 27 Jan. 1811; d. Stockbridge, Mass., 9 Dec. 1859. He was graduated at Columbia College in 1829, and was admitted to the bar in 1833. He was attache at the United States legation at Paris in 1833-34, and afterward practised law in New York until 1850. From 1858 until his death he was United States district attorney of the southern district of New York. Author of 'Memoir of William Livingston' (1833); 'What is Monopoly?' (1835); 'Treatise on the Rules Which Govern the Interpretation and Practise of Statutory and Constitutional Law' (1857; 2d ed., 1874), etc. He edited the political writings of William Leggett (2 vols., 1840).

SEDGWICK, William Thompson, American biologist: b. West Hartford, Conn., 29 Dec. 1855. He was graduated from the Sheffield Scientific School of Yale University in 1877 and later studied at Johns Hopkins University. He was an instructor at the former 1878-79; was at Johns Hopkins as a Fellow in biology 1879-80; as instructor and associate professor of biology at the latter also 1880-83. Since 1883 he has been professor of biology in the Massachusetts Institute of Technology. He was biologist for the Massachusetts State Board of Health 1888-96. He is a joint author of 'General Biology' (1886); and published 'The Principles of Sanitary Science and Public Health' (1902); 'The Human Mechanism' (1906).

SEDILIA, in architecture, originally the rows of seats in a Roman amphitheatre. Later applied to the stone seats on the south side of the altar in Roman Catholic churches; used by the priest, deacon and sub-deacon in the intervals of the church service. In cathedrals a row of such seats is provided for the clergy.

SEDIMENTARY ROCKS, as originally applied, a term used to indicate those deposits or sediments laid down by water, as contrasted with those rocks which have solidified from a fluid condition and known as igneous. The term has been somewhat expanded in recent usage, to include also the deposits formed by wind and those made by glaciers. They may be divided on the one hand into those laid down in the sea (marine), and those formed on land (terrestrial or continental). On another basis they are divided into aqueous, eolian and glacial. On still another basis they may be considered as of mechanical, chemical or

organic origin. The most familiar types are consolidated gravels, conglomerates; consolidated sands, sandstones; consolidated clay, shales; and consolidated marls or lime oozes, limestones. For a more detailed account of these rocks and the methods by which they are formed, see SHALE, SANDSTONE, and the section on *Sedimentary Rocks* in the article on ROCKS.

SEDITION, an offense short of treason but more serious than ordinary breach of the peace, or conduct tending thereto. Sedition, as a distinct offense, is unknown to English law, and is also unknown to United States laws, save in acts of Congress relating to the army and navy, and there it evidently means a mutiny or uprising against superior authority, for it is provided that a soldier joining any sedition, or who being present at a sedition does not do his utmost to suppress the same, shall be punished with death, while a sailor uttering seditious words can be punished at the discretion of a court-martial. State laws relating to sedition treat it as a minor offense, to be punished when it amounts to an actual attempt, whether in speaking or writing, or by actual violence, to agitate the overthrow, by unlawful means, of established authority. Anarchist meetings are within this description; when they lead to riot and murder, moreover, as in the case of the Haymarket Riot, in Chicago, the offense is more serious, and all parties concerned are held as principals or accessories to the crimes which result directly from their course of action.

The Alien and Sedition laws enacted by Congress in 1798 embodied an extension of the meaning of sedition which the majority of the American people evidently did not approve, and were aimed at freedom of speech and of the press. The motive for these laws was the suppression of the revolutionary tendencies excited by the French Revolution, the Republican (afterward called the Democratic) party sympathizing with the Revolution, and the Federalists being adverse at least to the extreme phases of that great convulsion. Several prosecutions under the Sedition Law served to make it more odious, and the consequence was the retirement of the Federalist party from power, and the election of Thomas Jefferson to be President of the United States. Since that time, except during the late Civil War, no attempt has been made to interpret as sedition the editorial utterances of the press regarding current events. See ALIEN AND SEDITION ACTS.

SEDITION LAWS. See ALIEN AND SEDITION ACTS.

SEDLEY, sĕd'li, SIR Charles, English poet, dramatist and wit: b. Aylesford, Kent, 1639; d. 20 Aug. 1701. He was educated at Oxford, but did not graduate. He wrote comedies and songs; of the latter one or two are still popular, but the former are unequal to his reputation. His first comedy, 'The Mulberry Garden,' partly founded on Molière's 'École des Maris,' was published in 1668; and among his other works of this class are 'Bellamira or The Mistress' (1687), based on the 'Eunuchus of Terence,' and 'The Grumbler.' In later life he entered Parliament and took an active part in politics, uniformly opposing the unconstitutional policy of James II, and was one of the chief promoters of the Revolution.

SED RAT, the name given in the religious lore of the Mohammedans to the lotus tree, standing on the right-hand side of the invisible throne of Ali, with two rivers running from its roots. Its boughs extend farther than the distance between heaven and earth, while numberless birds sing among them, and countless angels rest beneath their shade.

SEDUCTION, in law, the act of wrongfully persuading a woman, as by promise of marriage, to surrender her chastity. The theory of this offense in English law is that it is not against the seduced person but against the parent or person standing in that relation, who may sue for damages for actual loss of services caused by such seduction. If this be proved, he can recover not only any pecuniary loss he may have sustained but also compensation for injury to his feelings and damages by way of punishment of the offender. Very slight evidence of service is sufficient to establish the relation of master and servant and to fix the defendant's liability. The action is usually brought by the father, but it may be brought by any person who stands in the relation of master to the seduced person. Usually the woman cannot sue in her own name, but in Scots law she may do so if the deceit of the defendant has been the sole cause of the injury. The action, as a rule, can be brought only in behalf of an unmarried woman, the seduction of a wife being known as criminal conversation, but in England it was formerly held that an action might be brought by the father of a married woman living in his house separated from her husband and giving even the slightest services to her parent. By statute, however, the husband can now demand damages in a suit for divorce where the seducer is correspondent. While the rule in England is that the parent cannot sue if the daughter is not performing at least slight services for him, this has been modified in the United States to the extent that the parent may bring action if he is entitled to her services during minority, whether she is in his service or not. Statutes in the United States have greatly modified the old common-law rule. For instance, seduction was not a crime at common law, but in many of the States it has been made so by statute if the woman seduced was previously chaste, particularly when accompanied by a promise of marriage. Likewise in some States the seduced woman may bring the action in her own name and may have both a criminal and a civil remedy.

SEDUM, a genus of plants of the family *Crassulaceæ*, the many species of which inhabit chiefly the north temperate and Arctic zones. They have succulent, generally smooth foliage, of varying form, but often crowded on the stems, and four or five parted flowers, with distinct petals, usually in cymose inflorescences and of pink or yellowish hue. The carpels of the fruit are separate or united at the base. The sedums are pre-eminently useful for rock-gardens, and for cultivation in plots or in poor soil, since they are remarkably hardy under adverse conditions. Some prefer barren rocks, and spread luxuriantly over them, thus earning their common name of stone-crop. Like the house leeks (*Sempervivum*), which they closely resemble, they are easily propagated by seeds

or offshoots, and are possessed of great vitality. *S. telephium* is the orpine (q.v.), a live-for-ever, or live-long, so called because a cut branch, fastened out of doors, will grow, and perhaps bloom, drawing upon the store of reserve tissue in its fleshy bulk, and since it will occasionally start into growth when pressed and dried it is also called Aaron's rod. This species was further known as Midsummer men, as it was used for love-charms on midsummer's night, two stems of it being set up to see if one, representing a lover, would turn to the other. *S. acre*, the English wall-pepper, is a common creeping plant covered with yellow, star-like flowers, fond of sunny, rocky places, and is an emetic and cathartic. One of the handsomest species is the old-fashioned border plant, *S. spectabile*, with upright stems and broad cymes of purplish flowers. *S. telephioides* and *S. roseum*, the rose-root or rhodia of old time shops, with rose-scented roots, make themselves conspicuous by growing in great masses on mountain ledges. *S. album* was formerly used as a medicine, and cooked or eaten as a salad under the name of worm grass or prickmadam.

SEE, Horace, American naval engineer: b. Philadelphia, 17 July 1835; d. 1909. He received his training as a mechanical engineer in a machine shop. As superintendent engineer of the firm of William Cramp and Sons he was identified with its fame as the builder of high-class ships. He is known as the inventor of the hydropneumatic ash ejector, the cylindrical mandrel for face bearings and other important mechanical devices. He was consulting engineer and naval architect for several noted corporations in the United States.

SEE, Sir John, Prime Minister of New South Wales: b. Felling, Huntingdonshire, England, 1844; d. 1907. In 1853 he went to Australia, and in 1880 was elected member of the colonial Parliament, to which he was re-elected several times as member for Grafton until 1904. In 1885 he was appointed Postmaster-general and from 1891 to 1894 was Treasurer. In 1899-1901 he held the portfolio of Chief Secretary and Minister of Defense, and from 1901 to 1904 was Prime Minister. In 1902 he was knighted. Ill health compelled his retirement in 1904.

SEE, Thomas Jefferson Jackson, American astronomer and mathematician: b. on a farm near Montgomery City, Mo., 19 Feb. 1866. In 1884 he entered the University of Missouri and was graduated (A.B., L.B., S.B.) at the head of his class in 1889, with the Missouri astronomical medal for an original thesis on the 'Origin of Binary Stars.' He at once entered the University of Berlin, for post-graduate study, and won with high honors the degrees of A.M., Ph.D., 10 Dec. 1892. Upon returning to America 25 Dec. 1892, he organized and had charge of the department of astronomy at the University of Chicago, and aided in establishing the Yerkes Observatory, 1894. In 1896 Dr. See entered upon a survey of southern double stars and nebulae for the Lowell Observatory. During two years at Flagstaff, Ariz., and at the City of Mexico, he examined with a 24-inch telescope some 200,000 fixed stars, between 15 and 65 degrees south declination, and discov-

ered some 600 new double stars, besides measuring about 1,400 stellar systems previously reorganized by Sir John Herschel and other observers. Dr. See lectured on Sidereal Astronomy at Lowell Institute, Boston, in December-January, 1898-99, and was immediately afterwards appointed professor of mathematics, United States Navy, by President McKinley. On duty at the Naval Observatory, Washington, 1899-1902, with 26-inch telescope, he observed double stars and satellites, and measured the planets and satellites by daylight and at night, thus deducing the absolute diameters and constants of irradiation of the chief bodies of the solar system. On duty at the Naval Academy, 1902-03; since in charge of the Naval Observatory, Mare Island, Cal. During 1902-03, he investigated the position of Laplace's "Invariable Plane of the Solar System"; and during 1904-06 carried out important researches on the moments of inertia, internal densities, pressures, temperatures and rigidities of the heavenly bodies, earthquakes, etc. He has made numerous other researches in regard to the origin of the solar system, the cause of the land and water hemispheres of the terrestrial globe, gravitation, etc.

He has published 'Die Entwicklung der Doppelstern-Systeme' (Berlin 1893); 'Researches on the Evolution of the Stellar Systems' (Vol. I, Lynn 1896); Vol. II, 'Capture Theory of Cosmical Evolution' (1910); 'Researches on the Physics of the Earth' (in Proc. Am. Philos. Soc. 1906-13); 'Dynamical Theory of the Globular Clusters' (in Proc. Am. Philos. Soc., 1912); 'Electrodynamic Theory of Magnetism and of Universal Gravitation: Discovery of the Cause of Gravitation, with proof that this fundamental force of nature is propagated with the velocity of light' (communicated to the Royal Society of London, by Lord Rayleigh, Feb. 1915); 'Determination of The Physical Cause which has established the Unsymmetrical Equilibrium of the Solid Nucleus in the Fluid Envelope and thereby produced the well-defined land and water hemispheres of the Terrestrial Spheroid' (in 202d volume of the *Astrom. Nachr.*, Kiel, January 1916).

SEE, a word applied to the seat or throne of a bishop, but more usually employed as the designation of the city in which a bishop has his residence, and frequently as that of the jurisdiction of a bishop, that is, as the equivalent of diocese. The Holy See is located in Rome.

By universal usage, see designates the city (thence, at least in popular language, the entire diocese) in which the seat of the bishop is placed. Sees have, as a rule, been in some city, or considerable town, and in general the name of a see is taken not from the district governed by the bishop but from the city or town. To this usage, the names of most of the Protestant Episcopal sees in America are an exception. Sees *In Partibus Infidelium* were those which retained their ancient names, though in many cases not merely the cities themselves, but even all traces of the Christian religion, in the sites on which they anciently stood, have disappeared. In the Roman Catholic Church, the Pope alone establishes sees, and alters their distribution and their local limits and boundaries; though

these changes are not made except in extreme cases (e.g., the French Revolution) with out consent of the actual bishop. In the Church of England, all changes in dioceses, their limits, boundaries, etc., are done by authority of Parliament. In America the General Convention of the Protestant Episcopal Church creates new sees and changes limits of diocese. See **Diocese**.

SÉE, a river of France in the department of La Manche. It waters the arrondissement of Avranches and flows into the bay of Mont Saint Michel, which until the great tidal wave of the year 709 was a forested area 60,000 acres in extent. Equinoctial tides sometimes reach a vertical height of 50 feet at the river's mouth.

SEE-ADDER, an English name for a marine Stickleback, one of a group of small fishes (*Gastrosteus*) common in the coasts of the north temperate zone. The European varieties are found in certain districts in brackish water. Most species are well proportioned, the marine varieties being a trifle elongated. The mouth is moderately wide. The teeth are small but firmly set. A hard bony covering protects the head. There are no scales on any part of the body, but a set of shields or scutes protect the sides. The first dorsal and the ventral fins carry pointed spines. There are wide variations, however, between the several species and even within a species in regard to the degree of this armature. The sea-stickleback reaches a length of seven inches and has 15 spines on the back. It is never found in large schools. The stickleback is a short-lived animal, reaching an age of only three or four years. When the warm season approaches each male selects or appropriates a certain territory to himself and defends it against all comers especially against members of his own species and sex.

SEEBACH, Marie, German actress: b. Riga, 1834; d. 3 Aug. 1897. Her father was an actor and placed her at Cologne to prepare to become an operatic star. She held very many successful engagements and a number of starring tours and in 1887 was called to the Theatre Royal in Berlin. Her favorite rôle was Gretchen, but she was also very successful as Klärchen in 'Egmont,' Julia, Ophelia, Jane Eyre, Desdemona, Lady Macbeth, Maria Stuart, the nurse in 'Romeo and Juliet' and Louise in 'Kabale und Liebe.' She paid a visit to the United States in 1871 and gave there about 160 performances in 17 cities. The Marie Seebach Stiftung, a home for the poor of her profession, was endowed by her at Weimar in 1895. Consult Gensichen, 'Aus Marie Seebachs Leben' (Berlin 1900).

SEEBERG, Reinhold, German Lutheran theologian: b. Pörrafer, Livonia, 1859. In 1878-82 he studied at the University of Dorpat, and in 1882-84 at the University of Erlangen. In 1885-89 Dr. Seeburg was successively privatdocent, assistant professor and university preacher at the University of Dorpat. From 1889 to 1894 he was professor of Church history and of New Testament exegesis at the University of Erlangen, and from 1894 to 1898 held also the chair of systematic theology there. In 1898 he became professor of systematic theology at the University of Berlin. He is the author of several works on the history of

dogma and on the relations of the Church to the social life of the time, all of which are highly esteemed. The chief of these are 'Der Begriff der christlichen Kirche' (1885); 'Lehrbuch der Dogmengeschichte' (2 vols., 1895-98; 2d ed., 3 vols., 1907-13); 'Die Kirche und die soziale Frage' (1897); 'Grundriss der Dogmengeschichte' (1901; 3d ed., 1910); 'An der Schwelle des zwanzigsten Jahrhunderts' (1901; 5th ed., 'Die Kirche Deutschlands im 19. Jahrhundert,' 1904); 'Die Grundwahrheiten der christlichen Religion' (1902; 5th ed., 1910; English translation 'The Fundamental Truths of the Christian Religion,' 1908); 'Das Abendmahl im Neuen Testament' (1905; 2d ed., 1908); 'Aus Religion und Geschichte' (2 vols., 1906-08); 'Die kirchliche soziale Idee' (1907); 'Offenbarung und Inspiration' (1908; English translation 'Revelation and Inspiration' 1910); 'Sinnlichkeit und Sittlichkeit' (1909); 'Alte und neue Moral' (1910); 'System der Ethnik' (1911); 'Vom Sinn der Geschichte' (1913).

SEEBOHM, sē'bōm, Frederic, English economic historian: b. 1833; d. 1912. He was educated at Edinburgh and at Cambridge. In 1856 he became a barrister of the Middle Temple, but devoted much of his attention to the study of the social organization of the Saxon, Celtic and early English tribes, and has published 'The English Village Community' (1883-90); 'Tribal Custom in Anglo-Saxon Law' (1902); 'Tribal System of Wales' (1895); 'The Oxford Reformers: Colet, Erasmus and More'; 'The Era of the Protestant Reformation'; 'Customary Acres and their Historical Importance' (posthumous, 1914).

SEED PLANTS, plants of the highest branch of the vegetable kingdom, characterized by producing seeds (q.v.) as a result of the fertilization of their egg-cells, and called *Spermatophyta*, formerly known as the *Anthophyta*, and *Phanerogamia*. The first of these names is to be preferred, since it means "seed plants." The second which means "flowering plants" is less applicable, since in many plants, as the gymnosperms, there is properly no flower; and the third, meaning "visible marriage," is quite inapplicable, since the act of fertilization is very difficult to observe. There are more than 100,000 known kinds of seed plants, divided into two classes, namely: *Gymnosperms*, with naked seeds, and *Angiosperms*, with seeds enclosed in dry pods or fleshy fruits. The former, of which there are less than 500 kinds, include the pines, spruces, firs, cedars, cypresses, etc., while the latter include the lilies, grasses, orchids, buttercups, pinks, mints, roses, beans, parsleys, sunflowers and thistles. The Angiosperms are properly the "flowering plants," in which alone the organs of the flower are fully developed. For the families of seed-plants see **VEGETABLE KINGDOM**.

SEED TESTING, the determination of the purity and the viability of seed by natural or artificial means. The purity of seed embraces not only the idea of freedom from weed seeds, seeds of nearly related species, and such things as chaff, bits of stem, dirt, etc., but it also includes the idea of "trueness to type," or "purity of stock," as the seedsmen term it. This last, however, is generally a matter of seed-growing, the grower being held responsible for the ejection of "rogues," or plants which differ

from the particular variety in hand. In some cases, for instance with certain varieties of peas, the rogues may be removed by sieves where they are smaller or larger than the type, or by hand-picking where the color as in certain beans indicates a difference. Winnowing is also useful in various cases. The presence of rogues always lowers the value of the sample and careful seedgrowers and reputable seedsmen exercise constant vigilance in this respect. It is impossible, however, except with certain species or varieties, to recognize rogues by their seeds. Occasionally rogues are superior to the remainder of the crop; in such cases, when observed in time they may become important varieties, after due selection and growing by themselves for several years. For the satisfactory testing of purity of stock, samples of seed are grown in the field together with samples known to be pure and due comparisons are made, the conditions of soil, season, etc., being as nearly identical as possible. Trueness to type is far more important to the customer than either freedom from most impurities or a high per cent of germinable seeds, because the impurities can frequently be removed and deficiencies in germination may be adjusted by heavier sowings. Many specialists both in Europe and in America have devoted much time and study to the purity of seed; that is, the freedom from weed seed. Among their popular methods the following are most frequently used. Samples of equal weight are taken from various parts of the bulk and after thorough mixing a sample of this composite is taken. This is weighed and spread upon white paper or glass, and the impurities are picked out by means of forceps, each kind of impurity being placed by itself. Any seed not of the kind examined constitutes an impurity; that is, radish seed would be an impurity in cabbage samples. Each kind of impurity is then weighed and its percentage determined. These percentages vary considerably with the different kinds of plants, cereal and most vegetable seeds being grown under clean cultural methods, and being generally easy to clean, should be nearly if not fully 100 per cent pure; whereas clovers and grasses, being grown without such cultural care, and being much harder to clean without considerable loss of good seed, may often have as much as 25 per cent of impurities. These percentages have been tabulated both in Europe and in America, and form a basis by which the experiment stations of both continents judge samples sent in for inspection. The next operation is the determination of the character of the impurities. If these consist of useful seeds they may not seriously affect the value of the sample; but if noxious weeds are present the sample is condemned, and if 1 per cent or more of ordinary weed seeds is found many specialists condemn the sample. The presence of Canada thistle, cockle, dodder, wild mustard, chess, wildoats, Russian thistle, or of the bulbs of wild onion or garlic, even in small quantities, is generally sufficient to condemn the sample. These may all be seen with a hand-lens or even, in some cases, with the unassisted eye.

Germination tests are conducted either in soil under glass, out of doors, or in specially constructed germinators, some of which are rather elaborate in order to maintain particular conditions during the test. These devices are

seldom used except in the botanical laboratories of agricultural experiment stations. Many of the leading seedsmen devote some of their greenhouse space to the testing of seeds for viability. Their methods are about as follows: The samples are taken in various ways; but frequently the operator estimates the percentage that from his experience he feels sure will not grow. Then he picks out 100 or 200 seeds that he thinks will germinate and plants them. Upon the basis of the estimate and the actual behavior of the sample planted, he figures the approximate value of the seed. When greenhouses are not available seeds are often sprouted between sheets of damp blotting paper, upon porous saucers, plaster of paris dishes, etc.—methods of value also for the home testing of seeds. Temperatures favorable to the germination of each kind of seed must be maintained; these range from about 45 degrees to 80 degrees or even more. Oat seed will germinate upon melting ice. Moisture and an adequate supply of air must also be given and daily inspection and the removal of the sprouted seeds are essential. Some seeds germinate in a few hours; others require weeks.

Otherwise seed-testing is more interesting than useful, and it has not the all-importance formerly attributed to it, because, under existing conditions, arbitrary standards can rarely be established, because systematic inspection would be too cumbersome and costly, and because the reputable seedsmen are on the alert to keep their stock up to the highest practical grade without other inspection than that they exercise themselves. With them the price of seed is usually a rather safe index of purity, viability, etc., the higher price, other conditions being equal, indicating the superior quality. Such should be given the preference, especially with grass and clover seeds and such other seeds as are difficult to clean.

For interesting tables, details of methods, descriptions of apparatus, etc., consult various publications of the Division of Botany, and the 'Year Books' of the Department of Agriculture; also an epitome of these in the 'Cyclopedia of American Horticulture' (New York 1900-02).

SEEDS, the fertilized ovule of a phanerogamic plant, containing the embryo of a new plant like the parent and its food supply. Only one class of plants, the spermatophytes, develop true seeds. This class is subdivided according to the character of the ovules—whether naked and fertilized by pollen lying directly upon them (Gymnosperms), or enclosed in a pericarp, and fertilized through the medium of a stigma and the style (Angiosperms). The simple seed or seeds and the surrounding pericarp, formed by structural changes in the persistent parts of the flower or stalk, constitute the fruit. Often a one-celled indehiscent fruit containing a seed is mistaken for the seed itself.

The essential parts of a seed are developed from those of the ovule. They are the nucleus or embryo, and its food supply, and at least one, but nearly always two integuments, although assuming different positions in the seed. The embryo is generally visible as a distinct differentiation in the seed tissues, and one, two or several leaves may be seen issuing from the short axis or stem portion of the embryo called

the hypocotyl. These are the seed leaves or cotyledons. The number of cotyledons in Gymnosperms may vary from two to several; in Angiosperms, the embryo has either one or two, and this characteristic is so constant, that this class is further divided into monocotyledons or dicotyledons, according to the appearance of the seedling with one or two seed-leaves. The hypocotyl, often clasped between the cotyledons, bears at one end a mass of tissue called the plumule, where two tiny leaflets (in dicotyledonous seeds) may sometimes be discerned, and at the other end another mass called the radicle. Very often nutritive tissue is formed between the embryo and the seed-coats, and may be hard or horny. This reserve tissue, or albumen, as it is called, when derived from the nucellus is called perisperm, but when developed within the embryo-sac is the endosperm. The embryo itself, when this external nutriment is absent, is filled with an accumulation of reserve material, especially in the cotyledons.

When started into growth by the proper conditions of heat, oxygen and moisture the embryo liberates itself in many ways. In some monocotyledons, where the nutriment is stored outside of the embryo, the one seed leaf is provided with absorbent cells at its apex and is connected with the cells of the reserve tissue at that point, transferring the sustenance to the young embryo. Among the dicotyledons in such seeds as the gourd, the radicle pushes out through an aperture in the seed-coat, and fastens itself in the ground with lateral rootlets. It carries out one end of the hypocotyl with it, but cannot disengage the other, clasped between the cotyledons in their tightly fitting case, until the hypocotyl, arching itself in the effort to grow upward toward the light, finally exerts such a strain that the seed-case is ruptured, and the seed-leaves are pulled out. Then the hypocotyl straightens up and the two cotyledons turn green and act as foliage leaves. Often split acorns are found lying on the ground in early spring, anchored by a fleshy white thread. The embryonic leaves nearly fill the seed-coats, and are thick, swollen and tense, clasping the hypocotyl. The acorns take up water from their environment, the embryo begins to grow, the seed-coats burst at one end, and the radicle, the hypocotyl and the thick stalks of the cotyledons are extended. The radicle turns downward into the soil, producing root-hairs, and the plumule, extricating itself from the clasp of the seed-leaves, starts upward, but the cotyledons themselves remain in the coats of the acorn, and gradually give up all their store of nourishment to the embryo and dwindle away. In the mangroves, the whole process of germination takes place while the seed is still on the tree, and the embryo itself tumbles into the mud with such force that it remains in position to continue growth.

The seed-coats are variously constructed, the inner usually a papery colorless membrane, or of a mucilaginous, easily-swelling nature; the outer one, the "testa," while sometimes of other hues, is more often brown, gray or black. The testa is usually made of several layers of cells, each of which may be differently fashioned; but often provision is made for the extrusion of the embryo, and the hilum, or place of attachment, shows on the smooth or rough surface. Another growth is occasionally developed from

the base of the seed as it matures. This is either very small mere fleshy ridges or bumps surrounding the base, and then called a caruncle, which often becomes a specific character as in the *Polygalaceæ*; or entirely or partially encloses the seed, being then known as an aril, as in the orange investments of the spindle tree and the mace.

There are innumerable variations of the outer coats adapted to their needs of seed dispersion, protection and germination. Some seeds, like those of the quince, are enveloped in an adhesive mucilage which serves to cement them to the soil, so that the embryo may have a chance to strike into it. Certain smooth or polished seeds, when moistened, are capable of developing a similar mucilage either from the whole surface or from special groups of cells. In such cases as that of the squirting cucumber, which violently ejects sticky seeds, the mucilage not only secures the seed to the ground, but to any animal that chances to touch one, and they are therefore carried to some distance. Birds are fond of the viscid mistletoe berries and often carry the seeds away on their beaks, wiping them off on a convenient branch, to which they stick and start growth.

Plants native to loamy soils are likely to have seeds with irregular integuments, pitted and reticulated with delicate ridges which suffice to fix them in the earth, and others have developed spines for further anchorage. Others have growths of hairs, which in riverside willows, for instance, adhere to mud, or in the Spanish moss, become entangled in the roughnesses of the bark. The growth of hair upon a seed, however, is of more general use in the dispersion of the species. The cotton seed has a hairy investment which keeps it afloat in the wind, and the tufts of hair on fireweed and milkweed are familiar sights, sailing along in autumn and spreading these weeds far and wide. Some seeds instead of hairs, develop wings, as those of the cinchona and pine. Orchids have seeds so light and small that they drift away like dust.

Aquatic plants have seeds curiously adapted for dispersion by water. *Nymphaea* seeds are loosely enveloped in an aril, leaving an air chamber between it and the outer seed-coat, and the seeds therefore float and are driven about by the wind. Many smaller water plant seeds manage to keep afloat, and sometimes become entangled in the feathers of water fowl, to be transferred to other bodies of water. Very many seeds have extremely hard shells, and are practically impermeable to water like those sea-beans (q.v.) which come ashore on the sea coasts, having traveled over seas. Some of these hard-shelled seeds are transferred from place to place by birds and animals which eat their pericarps and eject the seeds uninjured. The vitality of certain varieties of seeds is extraordinary, some of them retaining their powers of germination for 20 to 30 years.

SEELER, Edgar Viguers, American architect: b. Philadelphia, Pa., 18 Nov. 1867. He was graduated from the Philadelphia Central High School in 1884, entered an architect's office, and later studied architecture at the Massachusetts Institute of Technology, and the École des Beaux Arts, Paris, where he was for three years under Victor Laloux. He returned

to America in 1893 to accept the assistant professorship of design in the architectural department of the University of Pennsylvania, began independent practice in 1895, but in 1898 withdrew from teaching, though remaining staff lecturer and adviser in the architectural department. Among important buildings designed and erected by him are the Astronomical Observatory and the Dental Laboratory of the University of Pennsylvania; the Winona Free Public Library, Minnesota (with W. P. Laird); the Real Estate Trust Company's office building, Philadelphia; the First Baptist Church, Philadelphia, and the James V. Brown Memorial Library, Williamsport, Pa., as well as many city and country residences. He was elected a Fellow of the American Institute of Architects in 1900, and a member of the faculty of the Pennsylvania Academy of the Fine Arts in 1902.

SEELEY, sē'li, Sir John Robert, English historian and essayist: b. London, 10 Sept. 1834; d. Cambridge, 13 Jan. 1895. He was graduated from Christ's College, Cambridge, in 1857; was elected Fellow and made classical lecturer there. He published (under the pseudonym "John Robertson") a book of poems (1859); was appointed in 1863 professor of Latin in University College, London, where he continued until 1866; and in 1865 published 'Ecce Homo,' in many respects the best, and certainly the best-known, of his works. It was a simple account of the life and teaching of Christ, dealing with these, however, as the title indicates, wholly from the human side. Owing to its title and the limited scope of the volume, the author was held to deny by implication certain doctrines, a consideration of which he had purposely omitted. There followed a discussion in which Newman, Gladstone and Stanley were numbered among the participants. In a later edition Seeley in a preface guarded himself against misconception. He was professor of modern history at Cambridge in 1869-95. Further publications of his are 'Natural Religion' (1882); 'The Expansion of England' (1883), a popular narrative from the imperial viewpoint; 'The Growth of British Policy' (1895); and 'The Life and Times of Stein' (1878), his chief contribution to historical knowledge.

SEELYE, sē'li, Julius Hawley, American college president: b. Bethel Conn., 14 Sept. 1824; d. Amherst, Mass., 12 May 1895. He was graduated from Amherst in 1849, and afterward studied theology at the Auburn Theological Seminary and at the University of Halle. From 1853 to 1858 he was pastor of the First Reformed Dutch Church of Schenectady, N. Y., from which charge he was called to the presidency of Amherst College. He was a member of the 44th Congress from Massachusetts, and was later engaged in the revision of the tax laws of that State. His writings include 'The Way, the Truth, and the Life' (1873); 'Christian Missions' (1875); 'Empirical Psychology' (1882); 'Citizenship: a Book for Classes in Government and Law' (1894).

SEELYE, Laureus Clark, American college president, brother of J. H. Seeley (q.v.): b. Bethel, Conn., 20 Sept. 1837. He was graduated at Union College in 1857 and during the next six years he was engaged in theological

study at Andover, Mass., Heidelberg and Berlin. After a brief pastorate in the Congregational denomination at Springfield, Mass., he accepted a call to the chair of English literature at Amherst in 1865, and in 1873 became the president of Smith College. In 1910 he was made president-emeritus. His best known books are 'The Antiquity of Celtic Literature' (1870); 'Our Celtic Inheritance' (1870); 'The Ancient Fenians' (1871); and 'The Higher Education of Women: its Perils and its Benefits' (1888); also various articles and addresses on educational and religious topics.

SEER, sēr, a weight in India, formerly varying in different parts of the country, but by an act of the Anglo-Indian government 31 Oct. 1871 adopted as the primary standard of weight, and made equivalent to a kilogram.

SEFATIANS. See MOHAMMEDANISM.

SEGAN-FU, sē-gān'foo, China. See SINGAN-FU.

SEGANTINI, Giovanni, Italian artist, 'the painter of the Alps': b. Arco, Trentino, 15 June 1858; d. Maloja, Oct. 1899. Bred in poverty, his mother dead, and abandoned by his father; before his teens herding flocks in the hills to earn a living, he amused himself by sketching surrounding scenes. His drawings becoming known, after further vicissitudes, he at length studied at the Brera Academy, Milan, while supporting himself by portrait painting and art tuition. His first pictures 'The Choir of San Antonio,' 'The Ship,' 'The Falconer,' and 'The Dead Hero,' showed his improving quality, and in 1882 he settled near Lake Como at Brianza, where he painted the 'Ave Maria,' which was awarded the gold medal at the Amsterdam exhibition (1883). This was followed by 'Mothers,' 'A Kiss,' 'Moonlight Effect,' and 'After a Storm in the Alps.' In 1886 he removed to Val d'Albora, 5,000 feet above sea-level in the Swiss Alpine Engadine, and influenced by Millet's vogue, sought his subjects in the lives of the lowly agriculturists of the region. 'The Drinking Place' won the gold medal in Paris in 1889; 'Ploughing in the Engadine,' now in the Munich Pinakothek, won the gold medal at Turin, 1892; 'At the Tether,' 'In the Sheep-fold,' 'Dark Hours,' 'By the Spinning Wheel,' 'Return to the Old Home' are also of this period, as well as 'Mid-day on the Alps' and 'Winter at Savognino.' As if premonitory of his all too early death he developed a moralizing and mystical vein which is shown in 'Sorrow finding Comfort in Faith' painted in 1896, now in the Hamburg Gallery; 'Unnatural Mothers' in the Vienna Gallery; 'Punishment of Luxury' in the Walker Gallery, Liverpool; 'Angel of Life' in the Budapest Gallery; 'The Massacre of the Innocents,' 'Divine Youth' and the 'Annunciation.' Segantini is ranked as the greatest of modern Italian artists. At Saint Moritz is the Segantini Museum, where many of his pictures are exhibited, including his unfinished 'Panorama of the Alpine World,' intended for the Paris Exhibition. Consult monographs by Montandon (Bielefeld 1904); Ritter (Paris 1898); Segantini (Munich 1913); Servaes (Vienna 1902); Sizeranne (Paris 1899); Villari (London 1901).

SEGAR. See CIGAR.

SEGESTA, sə-jēs'tə (Gr. *Egesta*), Sicily, the northwestern extremity of the island, lies 11 miles from Castellamare (q.v.), its port. Its interest is wholly historical, as the site is now unoccupied. Segesta was built upon a steep mountain, now known as Monte Varvaro, on the river called at present 'Fiume Gaggera. It formed an alliance with Athens in 416 B.C., and in 413 with the Carthaginians (after the fall of Syracuse). In the first Punic war, it became subject to Rome, thus acquiring the name Segesta. The ruins of the ancient city are extensive; the most remarkable are the Greek theatre and temple.

SEGMENTATION OF THE EGG. See EMBRYOLOGY.

SEGÓVIA, sə-gō'vī-ə (Sp. sā-gō'vê-ā), Spain, (1) capital of the province of the same name, on the Eresma, 43 miles northwest of Madrid, occupies a rugged height (3,300 feet), surrounded by ancient walls and defended by a turreted castle, the Alcazar. Its old-fashioned buildings are quaint but stately; its cathedral, a fine specimen of the Gothic, is scarcely surpassed in Spain. There are besides several other churches, suppressed convents, bishop's palace, mint, military academy, church seminary, theatre, hospitals and a picture gallery. The lofty aqueduct (built by Trajan) is the finest Roman ruin in Spain. Segovian Romanesque architecture is one of the most remarkable provinces of Spanish art. In few parts of the world can so much fine architecture and decorative sculpture be found. Paper, linen and glass are manufactured. The kings of Castile and Leon made Segovia their place of residence. In 1808 the town was entered and sacked by the French troops.

(2) The province covers an area of 2,713 square miles, whose surface is diversified by mountains and plains. The Sierra de Guadarrama, containing the famous defile of Somosierra, is the principal mountain. Silver, copper, lead, iron, marble and jasper are found in the mountain districts. The chief agricultural products are wheat, barley, madder, flax, hemp; besides grapes, olives, canobs and chestnuts. Large numbers of sheep are raised. Pop. 187,000.

SEGREGATION, in geology that tendency of mineral ingredients to separate from the parent magma, and to crystallize out, each by itself. In granite and other crystalline massive rocks, veinlike portions are found in which the matter is either coarser or finer than the rest of the mass. These were produced at the final stage of cooling of the rock, when the segregation from the original molten or viscous mass occurred along certain lines or around particular centres. These are termed segregation veins. Cracks or cavities may also be filled with mineral matter segregated from the surrounding rock mass. See MINING.

SEGU, sā'goo, or **SEGO**, sā'gō, West Africa, an important town of the French Sudan, in Bambara, on the left bank of the Niger, about 30 miles above Sansandig, and 350 from Timbuktu. The houses are built of clay, of a square form, with flat roofs; some of them have two stories and many of them are whitewashed. Besides these buildings, Moorish mosques are seen in every quarter. This town has been for

many centuries a stronghold for the Mohammedan faith. Pop. over 30,000.

SEGUIDILLA, səg-i-dēl'yā, a Spanish form of versification, consisting of four lines, generally assonant lines, of seven and five syllables alternately. It usually has a close of three verses, called *estribillo*, of which the first and last lines rhyme.

SEGUIN, sā'gwīn, **Edouard Onesimus**, American physician: b. Clamecy, France, 20 Jan. 1812; d. New York, 28 Oct. 1880. He was educated at the college of Auxerre and Saint Louis and studied medicine under Jean Gaspard Itard. The latter urged him to undertake the treatment of idiocy, and after careful study of the causes and conditions of congenital delinquencies, he opened a first school for the training of idiots in 1839. In 1844 a committee of the Academy of Sciences examined and commended his methods. After the revolution of 1848 he settled in the United States. In 1873 he was American commissioner to the Vienna exposition and published a 'Report on Education.' During his later years he gave attention to the study of animal heat and invented a physiological thermometer. He was connected with various medical societies and president of the Association of Medical Officers of American Institutions for Idiotic and Feeble-minded Persons. His published contributions to the subject include, 'Théorie et pratique de l'éducation des idiots' (1841-42); 'Traitement moral, hygiène et éducation des idiots et des autres enfants arriérés' (1846); 'Historical Notice of the Origin and Progress of the Treatment of Idiocy,' translated by J. S. Newberry (1856); 'Idiocy and its Treatment by the Physiological Method' (1866). Besides these he wrote a number of works on medical thermometry.

SEGUIN, Edward Constant, American physician and neurologist: b. Paris, France, 1843; d. New York, 19 Feb. 1898. He was the son of Dr. Edouard Onesimus Seguin (q.v.), and came with his father to America after the revolution of 1848. He was educated in the public schools of Ohio, began studying medicine with his father in 1861 and continued it at the College of Physicians and Surgeons in New York. He spent two years in the medical department of the Union army while enrolled as a student, and contracted a tubercular difficulty, to cure which he served among the United States volunteers at Little Rock, Ark., during part of 1864-65, and again in New Mexico during 1868-69. During the winter of 1869-70 he studied nervous diseases under such Parisian specialists as Brown-Séquard, Charcot, Ranvier and Cornil, and on his return to New York entered into a medical partnership with Dr. W. H. Draper. He was appointed pathologist to the Connecticut Hospital for the Insane at its opening and held the post 10 years. From 1871 to 1885 he was a member of the faculty of the College of Physicians and Surgeons, giving lectures on the spinal cord and on nervous diseases. In 1873 he founded a clinic for nervous diseases. Apart from these duties he carried on an independent practice in his specialty, beginning with 1876. He was one of the founders of the American Neurological Association, and the New York Neurological Association. He bequeathed to the Academy of

Medicine his large collection of books and pamphlets relating to nervous diseases, and to the College of Physicians and Surgeons other books and instruments.

SÉGUR, sâ-gür, Joseph Alexandre, French writer: b. Paris, France, 1756; d. there, 1805. He was author of operas and comedies which are still read, and also wrote 'Correspondance secrète entre Ninon de l'Enclos, le Marquis de Villarceaux et Madame de Maintenon'; 'La femme jalouse,' etc. A selection of his works has been published, 'Œuvres diverses' (1819).

SÉGUR, Paul Philippe, COMTE DE, French historian, son of the preceding: b. Paris, 4 Nov. 1780; d. there, 25 Feb. 1873. He entered the army in 1796 and rose to be brigadier-general and aide-de-camp to Napoleon during the Russian campaign. He was made a peer by Louis Philippe, and after the second Restoration retired to private life. He wrote 'Histoire de Napoléon et de la grande armée pendant l'année 1812' (1824); 'Histoire de Russie' (1829); 'Histoire de Charles VIII' (1835).

SÉGUR-D'AGUESSEAU, dâ-gě-sô, Louis Philippe, COMTE DE, French dramatist and historian, brother of the preceding: b. Paris, France, 10 Dec. 1753; d. there, 27 Aug. 1830. He was forced by his father to enter military life, served under Rochambeau in America, was appointed ambassador to Russia in 1783, and after the overthrow of the monarchy devoted himself to literature. He was appointed a member of the council of state by Napoleon and after the Restoration was received into the Chamber of Peers. He published 'La politique de tous des cabinets de l'Europe' (1793); 'Théâtre de l'Hermitage' (1798); 'Tableau historique et politique de l'Europe de 1786-96' (1800); 'Histoire des principaux événements du règne de Frédéric-Guillaume II' (1800); 'Histoire universelle' (1817); 'Histoire de France' (2 vols., 1824-34); 'Mémoires ou Souvenirs et Anecdotes' (1825); 'Œuvres complètes' (34 vols., 1824 et seq.).

SEGURA RIVER, sâ-goo'râ, Spain, a river rising in the province of Jaen, and flowing eastward in a winding course, past the city of Murcia, into the Mediterranean Sea. It enters the latter about 45 miles north of Cartagena after a course of 150 miles. In its upper course it flows through arid heath-lands, but lower down it has been made to irrigate its valley by means of numerous canals, the result being the proverbially fertile *Huerta de Murcia*. As a consequence of drawing off the water, however, the main channel is practically unnavigable.

SEIDEL, sî'děl, Emil, American socialist politician: b. Ashland, Pa., 13 Dec. 1864. He learned the wood carver's trade in Germany. He was one of the organizers of the Wood Carvers' Union, and of the Socialist party at Milwaukee, Wis. He was Socialist candidate for governor of Wisconsin in 1902; and was elected mayor of Milwaukee in 1910, serving one term.

SEIDL, zî'd'l, Anton, Hungarian composer and musical director: b. Budapest, Hungary, 6 May 1850; d. New York, 28 March 1898. He studied at the Leipzig Conservatory, and later at Budapest under Hans Richter, and by that musician was recommended to Richard Wagner

when the latter was preparing for the opening of the Baireuth Festspielhaus. As a consequence he came into intimate association with Wagner and acted as stage manager during the first season of music dramas there in 1876. In 1878 Seidl became musical stage manager at the Royal Opera House, Vienna, and the next year migrated to Leipzig where he was made conductor. After conducting the Nibelung dramas at London in 1882 he joined a company traveling through Germany, Austria, Hungary, Italy, Belgium and Holland during the seasons of 1883-84, which produced only the Wagner operas. He was made conductor at the Metropolitan Opera House, New York, in 1885 after the death of Dr. Leopold Damrosch, and thenceforth, though he made temporary sojourns in Europe filling musical engagements, he regarded America as his home. His influence upon the development of musical taste in this country was extended. Besides being made conductor of the concerts of the Philharmonic Society he was the organizer of the popular concerts held during several successive summers at Brighton Beach. Consult Krehbiel, H. E., 'Anton Seidl' (New York 1898).

SEIDLITZ (sěd'lits) POWDER, an aperient powder named from the mineral spring of Seidlitz or Sedlitz in Bohemia. Seidlitz powders are prepared in two parts, each contained in a separate envelope. The alkaline portion, which is contained in a blue paper, consists of two drams of Rochelle salts (tartrate of soda and potash) and 40 grains of bicarbonate of soda; and the acid part, in a white paper, of 35 grains of tartaric acid. In preparing for use, the alkaline portion is dissolved in half a tumbler of water, and the acid part is then added, producing effervescence; and the draught is to be taken while the effervescence is going on. Sometimes a little sulphate of magnesia is added to increase the strength.

SEIGNIORAGE, sě'nyör-āj. See COINAGE; FINANCE.

SEIGNORY, or SEIGNIORY, (1) in English law, the lordship retained by a grantor after alienation of land in fee simple, and regarded as an incorporeal hereditament. The seignory dates back to Roman times, and later found its way to England, where the only seignories now existing are those created before 1290. By a statute passed in England in 1882, a tenant for life of a manor may alienate the seignory of any freehold land within such manor. The lordships of manors are the only seignories of consequence to-day in England.

(2) In Canada, land held by a tenure resembling that of feudal times; also, a seignor's mansion.

SEISIN, in law, (1) possession of land by one claiming a freehold therein; also, the land so possessed. The possession must be actual and by a person entitled to the land or by one claiming a freehold interest therein. If the person having possession is disseized by one who intends to hold the freehold, either with or without legal right, the freehold is thereby transferred to the disseizor. Actual possession is known as "seisin in deed," while a right of present possession is known as "seisin in law."

(2) The ceremony accompanying the delivery of possession of land held in freehold: in this sense often called "livery of seisin."

SEINE, sãn (ancient, SEQUANA), a river in France, which rises in the department of Côte-d'Or, at the southwestern extremity of the Plateau de Langres, on the northern slope of Mont Tasselot, in the Bois de Chanceaux, about six miles northwest of Saint Seine and 20 miles northwest of Dijon. The first part of its course is north-northwest through the departments of Côte-d'Or and Aube, passing Châtillon and Troyes. After receiving the Aube at Marcilly, it proceeds almost due west, passing Nogent and entering the department of Seine-et-Marne, receives the Yonne at Montereau and shortly after the Loing and the Loing Canal, all on the left. Here its course becomes again north-northwest and it proceeds through the departments of Seine-et-Marne, passing Melun; the southeast of Seine-et-Oise, passing Corbeil; and Seine where, shortly before entering Paris, it receives the Marne on the right. Traversing Paris it shortly after commences a long series of remarkable windings, receives the Oise on the right, traverses the northwest of Seine-et-Oise, passing Mantes; the department of Eure, passing Pont de l'Arche and receiving the Eure; and that of Seine-Inférieure, where it flows through Rouen. Resuming its series of windings across the southern part of that department it forms a long and wide estuary and finally joins the English channel near Le Havre. Its direct course is 270 miles; its winding course about 500 miles. Of the latter, 350 miles, commencing at Méry below Troyes in the department of Aube, are navigable, but only by barges, which require to be tracked against the current if not moved by steam. The navigation properly commences at Rouen, from which to the port of Havre the river is usually distinguished by the name of the Seine-Maritime and at full tide floats sailing vessels of from 400 to 500 and steamers of 600 to 800 tons. Its estuary is much encumbered by shifting sandbanks and dredges are constantly employed to remedy this evil. At the time of the equinoctial gales and at spring-tides a "tidal bore" locally the *mascaret* with a perpendicular front rushes up the river with a great noise as far as Jumièges and sometimes even to Rouen. The area of the basin of the Seine is 16,700 square miles. The river is well supplied with fish. The scenery, though in parts surpassed by the Loire Saône and Garonne, taken as a whole, with the hills and valleys, forests and meadows, superb mansions, numerous villages, populous towns and famous cities which line its banks make the Seine the finest river in France.

SEISMOGRAPH, sīs'mō-grăf, or **SEISMOMETER**, an instrument for recording the period, extent and direction of each of the vibrations which constitute an earthquake. For a complete seismograph, three distinct sets of apparatus are required: (1) To record horizontal motion; (2) to record vertical motion; and (3) to record time. The horizontal and vertical motions must be written on the same receiver, and if possible side by side, while at the instant at which the time is recorded a mark must be made on the diagram which is being drawn by the seismograph. The first instruments were merely modifications of the **SEISMOSCOPE** (q.v.), but successive improvements have been introduced, and the seismograph has

been brought to a high pitch of perfection. Some of the best, if not the best, forms known are in use in the Imperial Observatory at Tokio, Japan. Milne's pendulum seismograph is a common form. This has a horizontal pendulum, swinging like the boom of a schooner. At the movable end of the pendulum is a box with a light which shines through the hollow pendulum rod, coming out through slits. By an ingenious mechanism any trembling of the light coming through the slits is recorded on a band of paper passing over a slowly moving timed cylinder. The Marvin seismograph, used by the Weather Bureau at Washington, employs a pendulum pointing upward, as in a metronome. The balance mechanism is of exceeding delicacy, and the mounting of the instrument is extremely solid to protect it from local vibrations. The record is taken on a traveling paper band in the ordinary manner.

SEISMOLOGY, sīs-mōl'ō-jī, that branch of physical science which is concerned with the study and investigation of the phenomena of earthquakes, their causes and effects, their distribution, and the various circumstances attending their occurrence. Its pursuit is regarded as of the utmost importance to geological and other forms of terrestrial research. Seismology, however, is not limited to the study of earthquakes in the usual restricted sense, but deals with related phenomena occurring under many and differing aspects. According to leading authorities, it should investigate minute movements or tremors of the earth which escape ordinary observation; pulsations of the earth which, by reason of the length of their period, are not noticed; and oscillations, or elevations and subsidences of the earth which slowly alter the relative land and sea levels. Seismology has been developed almost wholly since the beginning of the 19th century, and must still be regarded as in the early stages of its progress; but already it has a great and growing body of materials and of literature, and its possibilities seem to point to the application of the science in practical ways. One of these, it is confidently predicted, will be the warning of dwellers in seismic regions when earthquakes or similar disturbances impend. See EARTHQUAKE.

SEISMOSCOPE, the earliest and simplest form of earthquake recorder. The first known was invented by a Chinese named Choko, in 136 A.D., and shows the occurrence and direction of an earthquake by the fall of a column, a principle which was afterward independently adopted in the West. Vessels filled with viscid liquids have been used; the height to which the liquid is washed up the side of the vessel being taken to indicate the intensity, and a line joining the points of maximum motion to denote the direction of an earthquake. Palmieri's seismoscope consists of horizontal tubes turned up at the end, partly filled with mercury. To intensify the motion of the mercury, small floats of iron are placed on the surface, attached by threads to a pulley provided with indices moving in front of a scale of degrees, whence the intensity may be read off. The direction is determined by the azimuth of the tube giving the maximum indication, several tubes being placed in different azimuths. Pendulum seismoscopes,

both swinging and fixed, have also been employed. See SEISMOGRAPH.

SEISTAN, sās-tān, or **HAMUN, Lake**, Afghanistan, a large, irregularly-shaped, shallow lake or swamp on the western frontier adjoining the Persian province of Khorassan; a division of this province is named Seistan after it. The lake is not a single expanse of water, but is divided into three depressions. A great part of the area is generally dry; but, as the basin has no outlet, when the Helmund and its other feeders are in flood this lake regularly overflows its boundaries, fertilizing large tracts of country. The great variations in the size of this remarkable salt water lake give it a peculiar interest. The rainfall of the region is usually not over three inches, and in the spring a few pools only mark the seistan area. But as the depression here is 1,000 feet below sea level, it attracts the drainage of some 125,000 square miles, so that at times the lakes or chain of lakes is quite extensive. A sufficiency of grain is easily grown to support the population—over 200,000. There is an abundance of water-fowl, living in the vast reed-beds of the salt marsh.

SEITZ, sits, **Don Carlos**, American newspaper manager: b. Portage, Ohio, 24 Oct. 1862. He was graduated at Liberal Institute, Norway, Me., in 1880. He was city editor of the *Brooklyn Eagle* in 1889-91; was later connected with the *New York Recorder* and with the *Brooklyn World*; was advertising manager of the *New York World* in 1895-97, and has been its business manager since then. Author of 'Discoveries in Everyday Europe' (1907); 'Writings by and about James McNeill Whistler' (1910); 'Surface Japan' (1911); 'The Buccaneer' (1912); 'Whistler Stories' (1913); 'In Praise of War' (1917), etc.

SEIXAS, sēk'sas, **Gershom Mendes**, American patriot and minister: b. New York, 14 Jan. 1745; d. there, 2 July 1816. He was a son of a refugee from Lisbon (who settled in New York about 1730), and choosing the Jewish ministry as his profession in 1766 was placed in charge of the Spanish and Portuguese Synagogue of his native city. On the outbreak of the Revolution he espoused the American cause, closing the synagogue rather than continue it under British rule. While the majority of his people went to Philadelphia he settled in Stratford, Conn., until in 1780 he was asked to organize a synagogue in Philadelphia, the "Mikve Israel," where he continued to display his patriotic zeal. Owing largely to his efforts on 23 Dec. 1783 a modification in the test clause in the Pennsylvania constitution was made, whereby Jews were subjected to no disqualification for office. After the evacuation of New York in 1784, the old synagogue was re-established and Seixas resumed his former charge. In 1787 he was appointed one of the trustees of Columbia College, holding the office uninterruptedly until 1815. When Washington was inaugurated in 1789 Seixas was selected as one of the ministers to take part in the ceremonies.

SEJANUS, sē-jā'nūs, **Lucius Aelius**, son of a Roman knight, and favorite of Tiberius: b. Vulturni in Etruria; d. Rome, 31 A.D. In 14 A.D. he was made commander of the Prætorian bands, and acquired the confidence of the suspicious Tiberius, to such an extent as to govern

him completely; while the servile senate paid complete deference to the powerful favorite, the prætorian cohorts were also favorable to him, and there was no obstacle in the way of his attaining the supreme power he aimed at but Drusus, son of Tiberius, and the sons of Germanicus, Drusus and Nero, the nearest of kin to the emperor. Drusus was put out of the way by poison; the latter, with their mother, were banished and thrown into prison, a step which they did not long survive. Several friends of Germanicus were beheaded at the instigation of Sejanus; and when Tiberius finally retired from Rome, and withdrew from the government, Sejanus governed with absolute power, and the senate ordered that the statues erected in his honor should be publicly worshipped. But at the moment of his highest elevation the suspicions of Tiberius were awakened, and his measures were taken so cautiously, that Sejanus suspected nothing until openly accused by the emperor before the senate. He was then imprisoned, condemned to death, and executed on the same day. The historian Tacitus has given a searching and vivid, although possibly a prejudiced, account of the character and intrigues of Sejanus, while his fate is the subject of a tragedy of Ben Jonson's. Consult Tacitus, 'Annals' (iv, 1, 2, 3, 8, 39ff.; 74, and v, 6ff); Suetonius, 'Tiberius'; Jülg, 'Vita Lucii Aelii Sejani' (Innsbruck 1882); and Tarver, J. C., 'Tiberius the Tyrant' (New York 1902).

SEKAKUL, an African parsnip (q.v.).

SEKI KOWA, sā'kē kō'wa, or **SEKI SHINSUKE KŌWA**, or **TAKAKAZU**, Japanese mathematician: b. Fujioka, near the present Tokio, province of Kōzuke, 1642; d. near there, 1708. He was of the samurai class and became the greatest mathematician of his time in Japan, benefiting, however, by the work of several great Japanese mathematicians immediately preceding him, among whom was Yoshida. He was famous both as a teacher and for his discoveries, and his work greatly improved the algebra of the Japanese, which had come to them from the Chinese. He understood the native calculus, *yenri*, which he may have invented; and also knew the principle of determinants. Most of his manuscripts are lost. Consult Mikami, Y., 'Development of Mathematics in China and Japan' (1913); and Smith, D. E., and Makino, Y., 'A History of Japanese Mathematics' (1914).

SELACHII, sē-lā'kī-i, the order of fishes now known more generally as the *Elasmobranchii*, which includes the sharks, rays and their allies. See ICHTHYOLOGY; SHARKS, ETC.

SELAGINELLA, sē-lāj-i-nē'l'a, club moss, a genus of mostly tropical plants with small scale-like leaves and propagated by spores. (See FERNS AND FERN-ALLIES). The species are very numerous, and widely distributed in warm regions. They are generally quadrangular, the two lower rows of small one-veined leaves larger than the upper two rows, thus giving a flattened look to the fronds. They are generally creeping plants, often forming moss-like mats of foliage, but in some species supported by other plants, are erect and often several yards long. Selaginellas are cultivated in green houses both as pot plants, for edgings, and for hiding bare earth,

with their verdant foliage, sometimes iridescent, or changing in hue. *S. lepidophylla*, a Mexican species, growing in flat rosettes, while not very beautiful, is one of the familiar resurrection plants, because it becomes desiccated in time of drought and revives when moist conditions return. When dried out, it rolls its branches inward forming a ball, in which condition it is blown to a new situation by the wind. If it be placed in water the brown stems uncurl, flatten out into fern-like fronds and become green, and if this be done within a reasonable time after its uprootal, the selaginella will start into a new, genuine growth.

SELAH, sē'la, a Hebrew word which occurs 71 times in the book of Psalms and three times in the prayer of the prophet Habakkuk (Hab. iii), and is retained in the English Authorized version of the 'sacred texts; in the Septuagint version it is represented by the word *diapsalma*. Its signification cannot be definitely ascertained, but commentators interpret it variously as indicating either a pause or repetition, or the end of a strophe, or playing with full power, or a short recurring symphony, or, finally, a bending of the body in reverence. Dr. C. A. Briggs explains the term as a derivation from a verb meaning "to lift up" as in "raising" a hallelujah. Consult Jacob in *'Zeitschrift für alttestamentliche Wissenschaft'* (Vol. XVI, Giessen 1896); Briggs, C. A., in *Journal of Biblical Literature* (Vol. XVIII, Boston 1899); Briggs, E. C., in *American Journal of Semitic Languages* (Vol. XVI, Chicago 1899); Briggs, C. A. and E. C., 'Commentary on the Psalms' (New York 1906-07).

SELBORNE, sēl'börn, Roundell Palmer, 1st EARL OF, English statesman: b. Mixbury Oxfordshire, 27 Nov. 1812; d. Petersfield, Hampshire, 4 May 1895. He was graduated from Christ Church, Oxford, in 1834 and was called to the bar in 1837. He was returned to Parliament for Plymouth in 1847, became Solicitor-General in 1861, and was Attorney-General in 1863-66. He was knighted in 1861 and subsequently was made Baron Selborne. He was appointed Lord Chancellor in 1872 and did much to aid the establishment of a Supreme Court of judicature in 1873, but on the fall of the ministry in 1874 he again went out of office. He was reinstated as Lord Chancellor in 1880, was created Earl of Selborne in 1882, and in 1886 he separated from Gladstone on the Home Rule question and thereafter his political work was concerned chiefly with legal reform. He published 'The Book of Praise' (1863); 'Notes of Some Passages in the Liturgical History of the Church of England' (1878); 'Ancient Facts and Fictions Concerning Churches and Tithes.' Consult 'Selborne Memorials' (London 1896-98).

SELDEN, John, English scholar and statesman: b. Salvington, Sussex, 15 Dec. 1584; d. London, 30 Nov. 1654. He was educated at Oxford and afterward called to the bar of the Inner Temple. His first work, 'Analecton Anglo-Britannicon,' was a history of civil government in Britain before the Norman conquest. This notable publication was followed by two others dealing with the later progress of English law, and with the history of English titles of honor. His 'History of Tithes' (1618)

so offended James I that its author was severely censured by the High Commission court, and later cast into prison by the king for denying that Parliament owed its privileges to the Crown. As a member of the first two Parliaments of Charles I, in the second of which he supported the impeachment of the Duke of Buckingham, and in the famous Long Parliament in 1640, his career was marked by great zeal for the advance of civil and religious liberty. In 1629 he published the work upon the Arundel Marbles ('Marmora Arundellia'), for the translation of whose inscription he is famed. His other publications include 'De Successionibus in Bona Defuncti Secundum Leges Hebræorum' (1634); 'De Successione in Pontificatum Hebræorum Libri Duo' (Leyden 1638); 'De Jure Naturali et Gentium juxta Disciplinam Hebræorum' (1640). His 'Marie Clausum' (1635) was written in reply to Grotius' 'Mare Liberum.' His most famous work, however, is his 'Table-Talk' (published by his amanuensis, Richard Milward, in 1689 and reprinted in London 1868). Consult Wilkins' collection of Selden's works, with life of the author (1726) and Aikin, 'Life of Selden'; Johnson, G. W., 'Memoirs of John Selden' (10 vols., New York 1883-84); and Waters, Robert, 'John Selden and His Table-Talk' (ib. 1899).

SELECTIVE SERVICE LAW AND DRAFT. The Act of Congress authorizing the President to increase temporarily the Military Establishment of the United States, approved 18 May 1917, provided for the raising and maintaining by selective draft of increments (in addition to the regular army and national guard of 500,000 men each, together with recruit training units for the maintenance of such increments at maximum strength, and the raising, organizing and maintaining of additional auxiliary forces and also for raising and maintaining at their maximum strength, by selective draft when necessary, the regular army and the national guard drafted into the service of the United States. It also provided that such draft shall be based upon liability to military service of "all male citizens, or male persons not alien enemies, who have declared their intention to become citizens, between the ages of 21 and 30 years, both inclusive"; that the several States, Territories and the District of Columbia should furnish their proportionate shares or quotas of the citizen soldiery determined in proportion to the population thereof, with certain credits allowed for volunteer enlistments in branches of the service then organized and existing. The nation was confronted with the task of constructing, without delay, an organization by which the selection might be made for the entire country by means of a uniform and regulated system. A suggestion of administration, incomplete because of entirely different conditions, arose from the precedent of the Civil War draft; and on 22 May 1917 the judge-advocate-general was detailed as "provost-marshal-general" and charged with the execution, under the Secretary of War, of so much of the act of 18 May "as relates to the registration and selective draft." Plans had already been formulated for the operation of the selective draft, and with the formal designation of the provost-marshal-gen-

eral the work of organization began. It was obvious that to build up a new Federal organization would require a greater period of time than was afforded by the military necessity. The existing governmental organizations of the several States were presented as available substitute and the statute authorized their use. This expedient was unprecedented, but its practice abundantly justified its adoption.

The immediate need was for a comprehensive registration of every male of draft age. To effect this registration each State was divided into districts containing a population of approximately 30,000, in each of which a registration board was appointed by the governor. Usually this board consisted of the sheriff, the county health officer and the county clerk; and where the country's population, exclusive of cities of more than 30,000 inhabitants, exceeded that number, additional registration boards were appointed. Cities of over 30,000 were treated as separate units. The election district was established as the actual unit for registration in order that the normal election machinery might be utilized, and a registrar for every 800 of population in each voting or election precinct was appointed by the registration board. In cities approximating 30,000 of population the registration board was made up of city officials, and where the population exceeded the unit number additional registration boards of three members were appointed, one a licensed physician.

Governors and mayors were given considerable latitude in making geographical divisions of the States and cities for the purpose of defining registration jurisdictions; the only limitation being that approximately 30,000 inhabitants should be included within the confines of a district. The general scheme was that the board of three should exercise supervision over the precinct registrars, the governors supervising the work of the registration boards, while the mayors of cities containing 30,000 or more inhabitants acted as intermediaries between governors and registration boards. Each State was constituted a separate unit and each governor was charged with the execution of the law in his State. By proclamation of the President, 5 June 1917, was designated as registration day throughout the United States, with the exception of Alaska, Hawaii and Porto Rico; and, due to the fact that registration organization of the States had been so quickly and thoroughly completed, 9,586,508 male citizens of the designated ages were registered on the day set, and the first step in the operation of the selective service law was accomplished. Registration consisted in entering on a card essential facts necessary to a complete identification of the registrant and a preliminary survey of his domestic and economic circumstances.

With the registration completed there followed the operation of examination, selection and mobilization. The unit jurisdiction of approximately 30,000 of population was maintained as far as possible, and for each district or division a local board of three members was appointed by the President upon the recommendation of the governor. The board members were residents of the districts they served, and the personnel comprised representative and responsible citizens of the community, including

usually a licensed physician. In many cases registration boards were reappointed local boards. Such boards exercised original jurisdiction in all cases except claims for discharge on account of engagement in industry or agriculture. In every Federal judicial district one or more district boards were organized, consisting usually of five but in some cases of a larger number of members, comprising leading citizens of the community and appointed by the President upon the recommendation of the governor. District boards exercised appellate jurisdiction over local boards and original jurisdiction in industrial and agricultural claims. The initial step in the process of examination and selection was to establish the order of liability of each of the registrants to be called for service. The cards within the jurisdiction of each local board, taken as a unit, had been serially numbered when completed and filed, and duplicates of the cards so numbered were deposited with the governor and with the district boards. The average number of registrants within the jurisdiction of a local board was about 2,500, the highest being 10,319. In order to establish the order of liability of each registrant in relation to the other registrants within the jurisdiction of the same local board, a drawing was held 20 July 1917 in the public hearing room of the Senate Office building in Washington, as a result of which every registrant was given an order number and his liability to be called for examination and selection determined by the order number. The official lists of the numbers drawn by lot were furnished to every local board and from these lists the boards made up the availability order list of all registrants within their respective jurisdictions.

The selective service law required certain persons to be exempted from military service, including Federal and State legislative, executive and judicial officers, ministers of religion, students of divinity, persons in the military or naval service of the United States and certain aliens. The law further authorized the discharge from draft, under such regulations as the President might prescribe, of county and municipal officers, custom-house clerks and other persons employed by the United States in certain classes of work, pilots and mariners, and, within prescribed limitations, registrants in a status with respect to persons dependent upon them for support and persons found physically or morally unfit. Exemption from combatant service only was authorized in the case of persons found to be members of any well-recognized religious sect or organization whose existing creed or principles forbid its members to participate in war in any form, and whose religious convictions are against war or participation therein. The success of this great undertaking was primarily due to the painstaking forethought and the statesmanlike breadth of view with which the provost-marshal-general and his associates organized the machinery for its execution. But other elements have contributed to its success, and first among these was the determination to rely upon the co-operation of the governors of States and State agencies in the assembling of the registration and exemption boards. By reason of this association of State and local agencies with the National government the law came as no man-

date enforced by soldiers, but as a working of the home institutions in the hands of neighbors and acquaintances pursuing a clear process of selection, and resulting in a gift by the States to the nation of a body of men to be trained. The press of the country co-operated in a most helpful way, drawing the obvious distinctions between this mode of selection and those punitive drafts which have sometimes been resorted to after the failure of volunteering, and pointing out to the young men of the country that the changed conditions of warfare made necessary a mode of selection which would preserve the industrial life of the nation as a foundation for successful military operations. The country seemed generally to have caught enough of the lessons of the European War to have realized the necessity of this procedure, and from the very beginning criticism was silenced and doubt answered by the obvious wisdom of the law. The unquestioned fairness of the arrangements, the absence of all power of substitution, the fact that the processes of the law were worked out publicly, all co-operated to surround the draft with assurances of fairness and equality, so that throughout the whole country the attitude of the people toward the law was one of approval and confidence. This does not mean that the law is perfect either in its language or in its execution, but that its passage may be regarded as a milestone in progress toward self-consciousness and national strength. Its acceptance shows the unity of spirit of the people, and its operation shows that a democracy has in its institutions the concentrated energy necessary to great national activities, however much they may be scattered and dispersed, in the interest of the preservation of individual liberty, in time of peace. The problem presented involved not merely the selection of forces to be trained into armies but officers to do the training. By the provisions of the national defense act of 3 June 1916 officers' reserve corps had been authorized. Rules and regulations for their organization were promulgated in July 1916, and amended in March 1917. Immediately upon the passage of the act the building up of lists of reserve officers in the various sections of the military establishment was undertaken, with the result that at the end of the fiscal year some of the branches of the service had substantial lists of men available for duty in event of call. The largest number of commissions were issued in the technical services, for which professional non-military training was the principal requisite. The largest reserve corps was that in the medical department, in which more than 12,000 physicians were commissioned. The expansion of these technical services proceeded easily upon the basis of the reserve corps beginning, but the number of applicants for commissions in the strictly military or combatant branches of the service was relatively small. They consisted of men who had had military experience either in the regular army or the national guard, and men who were graduates of schools and colleges affording military training, and of the training camps which had been maintained at Plattsburgh and throughout the country. Their number, however, was wholly inadequate, and their experience, while it had afforded the elements of military discipline, had not been such as was plainly required to train men for partici-

pation in the European War with its changed methods and conditions.

The original selective service law, with its subsequent amendments, mobilized the man power of the nation between the ages of 18 and 45, inclusive. Under the original and later acts approximately 23,709,000 men were registered and slightly over 2,800,000 were inducted into the military service in a manner that was fair to the individual, efficacious in providing the army with men as quickly as they could be equipped and utilized and provocative of a minimum of disturbance to the industrial and economic life of the nation. After 15 Dec. 1917 the administration of the law was greatly improved by the system of classification that was employed in the selection of men. The economic needs of the nation required that men whose removal would interfere with its civic, family, industrial and agricultural life should be taken in the order in which they could be best spared. On 15 December all exemptions that had previously been granted were annulled and all registrants were required to file questionnaires giving detailed information in regard to industrial status and claims for exemption. Registrants were arranged in five classes in the inverse order of their importance to the economic interests of the nation and the support of dependents. The men thus placed in class one were first rendered liable for military service, those in the other four so-called deferred classes being granted temporary exemption. On 16 May 1918, according to a joint resolution of Congress, it became possible to frame new regulations whereby the quotas to be furnished by the several States were apportioned according to the number of registrants in class one, instead of according to population, as was required by the original act of the previous year. Further registrations of men who had attained the age of 21 years since the first registration were held on 5 June 1918 and 24 Aug. 1918, according to the provisions of presidential proclamations, authorized in the joint resolution of Congress, approved 20 May 1918. On 7 Aug. 1918 the distinguishing appellations "Regular Army," "Reserve Corps," "National Guard" and "National Army" were ordered discontinued; and the military forces of the nation were consolidated into the "United States Army." About the latter part of July it became evident that the carrying out of the military program would soon lead to the exhaustion of class one. In order to prevent the industrial disturbance and economic hardships incidental to calls upon the deferred classes, Congress passed an amendment to the selective service law, approved 31 Aug. 1918, which provided for the registration of all male persons between the ages of 18 and 45, both inclusive, and made registrants liable to service in the navy and marine corps as well as in the army. This registration was held on 12 September 1918. In putting into execution the provisions of the selective service law, registration was by States. Each State was divided into districts with registration boards appointed by the governor. Registration was handled by the same machinery that handles voting during elections. The subsequent work of examining and classifying registrants was handled by local and district boards appointed by the President upon the recommendation of the governors of the various States. In November 1917 two ad-

ditional types of local boards were established to aid in the administration of the draft. Medical advisory boards were appointed by the President on the recommendation of the governors. These boards varied in membership from 3 to 40 and consisted of leading medical authorities who were in a position to act in an advisory capacity to those who were charged with making physical examinations of registered men. At the same time legal advisory boards were also established to assist registrants and draft officials in the interpretation of the selective service law. These boards consisted of three permanent members appointed by the President on the recommendation of the governor and an indefinite number of associate members appointed by the governor direct. On 4 July 1918 the provost-marshal-general in a letter to the local draft officials suggested the advisability of establishing boards of instruction, which should get into close and immediate touch with newly drafted men and give them preliminary directions in order better to fit them for the duties facing them. Slightly over 2,800,000 of the registrants were inducted into military service, 2,541,000 through calls issued to local boards to furnish their allotted quotas and 259,000 through induction of individuals. Approximately 140,000 of the latter were inducted in October and during the first 10 days in November for the Students' Army Training Corps. The inductions during each month are shown in the following table:

Month	Men Inducted	Month	Men Inducted
1917		April.....	174,377
September.....	296,678	May.....	373,063
October.....	163,644	June.....	301,941
November.....	35,721	July.....	401,147
December.....	20,320	August.....	282,898
1918		September.....	252,295
January.....	23,288	October.....	250,000
February.....	83,779	November.....	10,000
March.....	132,484	Total.....	2,801,635

With the exception of the Students' Army Training Corps and a few thousands of voluntary inductions, no men of the last registration were inducted into the army. This means that of the 10,481,000 registrants between the ages of 21 and 30 approximately 2,630,000, or 25 per cent, were taken into military service through the draft. At the time of the signing of the armistice class one of the 21 to 30 years old group was practically drained of men capable of rendering full military service. Those remaining classified therein were men qualified for limited service only, men granted temporary deferment on account of employment with the Emergency Fleet Corporation and men classed as delinquents on account of failure to file questionnaires. These groups constituted about 6 per cent of the total registrants. About 4 per cent of the registrants were placed in deferred classes on the ground of employment in a necessary industrial or agricultural enterprise and about 65 per cent on all other grounds.

The balance sheet of the first draft as prepared by the provost-marshal-general's office, as of 30 Aug. 1918, shows the registration of 5 June 1917, 9,586,508; inducted or otherwise ac-

counted for prior to 1 Dec. 1917, 897,061; number due to file questionnaires, 8,689,447; number placed in Class I, 2,473,680; number placed in Class II, 497,261; number placed in Class III, 416,456; number placed in Class IV, 3,406,240; number placed in Class V, 1,895,810; total, 8,689,447. Analysis of Class I—Total number in Class I, as of 1 Sept. 1918, 2,473,680; delinquents, 285,895; emergency fleet, 46,552; limited service, 245,234; remedial defectives, 58,950; not physically examined, 42,801; total, 679,432. Fighting men left, 1,794,248; registration of 5 June 1918, 744,865; number placed in Class I, 408,517; total, 2,202,765. Delinquents, 11,107; emergency fleet, 5,530; limited service, 32,589; remedial defectives, 9,433; not physically examined, 37,771; total, 96,430.

The nationality of aliens registered was: Co-belligerents—Belgium, 3,952; France, 3,510. Great Britain—England, 27,553; Ireland, 20,840; Scotland, 7,491; Wales, 1,563; Canada, 47,258; elsewhere, 16,479. Greece, 68,005; Italy, 245,679; Portugal, 21,943; Rumania 7,695; Russia, 275,413; Serbia, 2,852; China, 7,170; Japan, 15,336. Neutral—Denmark, 8,063; Netherlands, 6,679; Norway, 16,678; Sweden, 24,663; Switzerland, 4,929; Mexico, 59,145; Central and South America, 5,429; sundries, 22,688. Enemy—Germany, 40,663; Austria-Hungary, 238,768. Allied with enemy—Bulgaria, 7,271; Turkey, 36,031; total, 1,243,801.

As an average per capita cost for registering men for the Federal draft and inducting them into the national army by 30 June 1918 that of \$1.42 in the State of New York, as shown by the Selective Service Bureau of the adjutant-general's office, may be cited. In New Rochelle the cost to the government was nothing, that city bearing the expense. In other places the induction cost per capita ran from 12 cents a man by Board 164 of New York City to \$2.58 a man by Board 161 of New York City. The boards ranking next to New Rochelle and Board 164, New York City, in lowest cost were: Board 184, New York City, 26 cents per man of 2,833 men; Oneida County Board 2, 27 cents a man for 1,698 men; Orange County Board 2, 31 cents a man for 2,428 men. The highest per capita cost in cities outside of New York was in Albany City Board 1, where 2,036 men were inducted at \$2 each. The highest per capita cost in counties was in Rensselaer County Board 1, where the average was \$2.44 for 1,822 men going into the service for the period ending 30 June 1918.

EDWARD S. FARROW,

Consulting Military and Civil Engineer.

SELECTMEN, a name given in the New England States to the chief officer of a town or village. English parishes had their vestries, which were of two sorts, common vestries, composed of all the rate-payers and select vestries. In the latter, concerns were managed by select vestrymen. Hence the term selectmen, as used in New England, for the governing board of a town. The practice is found in Massachusetts as early as the issue of the 'Body of Liberties.' The selectmen acted under the orders of the town meeting. See TOWN AND TOWN MEETINGS.

SELENE, sē-lē'nē. See LUNA.

SELENGA (sā-lēng'gā) **RIVER**, Asia, a river rising in the Khangai Mountains in western Mongolia, flowing northeast through Mon-

golia and the Russian Transbaikal district, and emptying into Lake Baikal near its southern end. It is 750 miles long, and navigable for light vessels to its junction with the Orkhon. It receives through the Egin-kol the overflow of the large Lake Kosso-gol. The Selenga is the main headstream of the Angora, the principal tributary of the Yenisei.

SELENITE, the crystallized or distinctly foliated variety of the mineral gypsum, hydrous calcium sulphate. It is number two in the scale of hardness, is flexible, but when broken has a "fibrous fracture" which consists of two imperfect cleavages. When pure it is colorless and transparent. The cleavage plates have a pearly lustre which is characteristic of the clinopinacoid while the other faces of the crystal are subvitreous. Plates of selenite several feet across and perfectly transparent are not uncommon, while crystals five feet in length have been found in Utah. Fine large crystals are also found in Italy, France and Switzerland. Limpid crystals of matchless beauty occur in the Sicilian sulphur mines. Twin crystals are common in all these localities, the most typical of which are the "fish-tail" twins. Foliated selenite is abundant in Nova Scotia, also at Lockport and elsewhere in New York, while crystals of model-like perfection are found near Ellsworth, Ohio. Like massive gypsum, selenite is an exceedingly common mineral. It has been used to some extent as a filler for paper, paints, etc.

SELENIUM, symbol Se, atomic weight 79.2. It was discovered by Berzelius (1817) in the refuse of a sulphuric acid factory. A non-metallic element occupying an intermediate place between sulphur and tellurium. Occurs in the free state in small amounts usually associated with native sulphur. Found in many minerals combined with various metallic elements as copper, lead, mercury, silver, etc. Here again the compounds of selenium are found in company with the analogous compounds of sulphur. Free selenium is prepared from the compounds of selenium found in the dust deposited in the furnace flues where sulphides are burned in the manufacture of sulphuric acid. This is oxidized to selenious acid (see below) which upon treatment with sulphurous acid gives selenium.

It is found that there occurs a remarkable variation in the electrical resistance of selenium as the intensity of the light which falls upon it is varied; when the light to which selenium is exposed is increased in intensity, the electrical resistance is diminished. It is this principle that is the basis of the "Selenium Photometer" of astronomy, an instrument of extreme delicacy by which the variations in intensity of the feeble light of the stars can be measured with an accuracy which is unapproachable by any other means.

Selenium exists in two allotropic forms. The one obtained as above is a red amorphous powder soluble in carbon di-sulphide, while if this powder be melted and again cooled suddenly to 210° C. it forms a dark vitreous mass insoluble in carbon di-sulphide. Crystalline forms are also known.

In general chemical behavior it is closely related to sulphur and tellurium, all three forming analogous oxides, oxygen acids and hydrogen compounds.

Selenium Dioxide, SeO_2 , a white crystalline compound formed when selenium is burned or by heating selenious acid. It dissolves readily in water forming selenious acid.

Selenious Acid, H_2SeO_3 , a crystalline solid found by oxidation of selenium in presence of water, as above. It is a di-basic acid forming salts called selenites having the general formula M_2SeO_3 .

Selenic Acid, H_2SeO_4 , a heavy liquid resembling sulphuric acid and formed by action of powerful oxidizing agents on selenium or selenious acid. It differs from sulphuric acid in being unstable, losing its oxygen readily and thereby passing to selenious acid. Also a di-basic acid forming salts called selenates (M_2SeO_4).

With hydrogen selenium forms a very disagreeable smelling gas called seleniuretted hydrogen (H_2Se), the analogues of sulphuretted hydrogen. Selenium forms compounds with many metallic elements (see above) called selenides. These are analogous to the sulphides and usually occur along with them. They may be made by heating selenium with the metal.

SELENODONT TEETH, a type of molar teeth, characteristic of modern herbivorous animals, on which the crown of the tooth exhibits curving ridges of enamel instead of rounded tubercles. See BUNODONT.

SELENSULPHUR, an orange- to brownish mineral consisting of sulphur and selenium. It is a result of volcanic action, and occurs as an incrustation in the islands of Lipari, Vulcano, Hawaii and Japan. The name is often improperly applied to orange-yellow crystals of native sulphur from Sicily.

SELEUCIA, sēl-ū'sī-ā, Asia, the name of several cities founded by Seleucus Nicator. (1) The most celebrated was SELEUCIA-ON-THE-TIGRIS, made the capital of Babylonia in place of Babylon, from which it was distant about 30 miles, and which it eclipsed in wealth and splendor. The Tigris and Euphrates flowed near its walls, and rendered it one of the richest commercial cities of ancient times. The number of its inhabitants at the time of its greatest prosperity is estimated to have been about 600,000, chiefly Greeks. During the decline of the Seleucidæ monarchy it became independent, and from its great wealth became the centre of attraction to the pillaging tribes of southern Armenia and Media, by whom it was partially plundered several times. In 116 A.D. it was burned by Trajan, and a few years later its destruction was completed by Lucius Verus, the Roman emperor. From that time it was deserted and became as desolate as Babylon itself. (2) Another important city, SELEUCIA PIERIA, founded in 300 B.C., was situated in the sea-coast at the foot of Mount Pieria, 12 miles west of Antioch. Its natural strength was improved by every known art of fortification, and this combined with its magnificent buildings obtained for it a distinguished position among the great cities of antiquity. It occupied a very prominent place in the wars between the Seleucidæ and the Ptolemies, but it rapidly declined under the Roman dominion, and in the 6th century of our era the city had fallen into complete decay. (3) SELEUCIA TRACHEOTIS, a city of Cilicia on the Calycadmes, was also built

by Seleucus. It was once a rival of Tarsus, and on its site are many ancient ruins. The modern Selefke is located here. (4) SELEUCIA, a city in Persia, was founded by Alexander the Great and called Alexandria. It was rebuilt as Seleucia by Antiochus I of Syria. Among the other cities of the name were Seleucia in Mesopotamia on the Euphrates; on the Belus in Syria; in the Pisidia; and in Pamphylia. The city of Tralles was also called by this name at one time. Consult Bouché-Leclercq, 'Histoire des Séleucides' (2 vols., Paris 1913-14).

SELEUCIANS. See RELIGIOUS SECTS.

SELEUCIDÆ, sē-lū'sī'dē, the descendants of Seleucus, a dynasty of kings who succeeded to that portion of the empire of Alexander the Great which embraced the eastern provinces, Syria and a considerable part of Asia Minor.

SELEUCUS I, surnamed Nicator, one of the diadochi or successors to the divided empire of Alexander, 365; d. 281 B.C. His father Antiochus was a general of Philip and he himself was one of the most distinguished officers of Alexander the Great, who invested him with the government of Babylonia and Media. On the death of Alexander in 323 Seleucus joined the conspiracy against Perdiccas, which resulted in the death of the latter, and in the second division of Alexander's dominions the satrapy of Babylon fell to his share. Like the other generals of Alexander he asserted his independence, and this step being opposed by Eumenes, he obtained the aid of Antigonus against him. Their united efforts proved successful, but Antigonus now turned upon Seleucus himself, who, rather than face him, withdrew to Egypt (316 B.C.). Two or three years later he succeeded in inducing Ptolemy, the governor of Egypt, along with Lysimachus and Cassander, to take the field against their common enemy Antigonus, now grown very powerful. Their forces proving victorious, he assumed the title of king of a vast dominion extending from the Euphrates to the Indus (306). After a final victory over Antigonus the whole of Syria and a great part of Asia Minor fell to the share of Seleucus. By subsequent victories over Lysimachus and Demetrius his possessions were extended so as to include the whole of Asia Minor. He was assassinated by Ptolemy Ceraunus. He was the protector of the arts and sciences, the benefactor of his people and the most upright of Alexander's successors. Besides several cities of the name of Seleucia, he likewise founded Antioch. He was succeeded by his son Antiochus I. (See ANTIOCHUS). SELEUCUS II, surnamed CALLINICUS, succeeded his father Antiochus II in 246. He murdered his step-mother Berenice, and Ptolemy Euergetes, her brother, invaded the territories of Seleucus to avenge her death, but eventually concluded a truce with his foe and retired. After this Seleucus with varying success engaged in contests with his brother Antiochus Hierax, Tirdatus, king of the Parthians, then with Ptolemy, who had broken the truce. In an expedition, however, against the Parthians he was defeated by Arsaces I, king of Bactria. He died in 226 B.C., having reigned 20 years, and was succeeded by his son SELEUCUS III, who only

reigned three years, being followed by ANTIOCHUS III, surnamed the GREAT. SELEUCUS IV, surnamed PHILOPATOR, succeeded his father Antiochus III in 186. Syria had been greatly weakened by the war carried on by Antiochus against the Romans, and Seleucus had to pay immense sums to the victors. His reign was signalized by few events of importance, and after he had been 12 years on the throne he perished from poison (175). ANTIOCHUS IV, surnamed EPIPHANES, succeeded him, and is notorious for his cruel persecution of the Jews, whose religion he attempted to extirpate. ANTIOCHUS V, surnamed EUPATOR, was the next in line (164-162). Under his reign the government was weak and corrupt. DEMETRIUS I, surnamed SOTOR, followed, but was defeated and killed by an imposter who claimed to be the son of Antiochus Epiphanes, ALEXANDER BALAS (150-145). The succeeding rulers were DEMETRIUS II (Nicator), who was taken prisoner by the Parthians, and in whose place ANTIOCHUS VI ruled (145-140), but who later ascended the throne himself (140-137); ANTIOCHUS VII (SIDETES) who restored the royal line and was the last strong ruler of the Seleucidæ; SELEUCUS V, who was murdered by his mother Cleopatra; ANTIOCHUS VIII (GRYPUS), who reigned in 125-96 sharing from 111 his kingdom with his step-brother Cyzicenus Antiochus IX; SELEUCUS VI (EPIPHANES), 96-95; ANTIOCHUS X (EUSEBES), 94-92; PHILIP I, 95-83; ANTIOCHUS XI (EPIPHANES), during 95; DEMETRIUS III (EUCÆRUS), 95-87; TIGRANES (84-69), who gained the sovereignty next by conquest; ANTIOCHUS XII (DIONYSUS) and ANTIOCHUS XIII, ASIATICUS (69-64) who was conquered by the Romans under Pompey who made Syria a Roman province in 64 B.C.

The power of Seleucidæ began to decline as early as the reign of Seleucus II, and they successively lost, through revolts and otherwise, Bactria, Parthia, Armenia, Judæa, and what subsequently remained was converted into a Roman province in 64 B.C. Consult Bevan, E. R., 'House of Seleucus' (2 vols., London 1902); Bouché-Leclercq, 'Histoire des Séleucides' (2 vols., Paris 1913-14); Haussoullier, Bernard, 'Etudes sur l'histoire de Milet et du Didymeion' (Paris 1902); Macdonald, G., 'Early Seleucid Portraits' (in *Journal of Hellenic Studies*, Vol. XXIII, London 1903).

SELF-CONSCIOUSNESS, the conscious recognition that one is an ego or personality; distinguished from Consciousness (q.v.). In the article in this encyclopedia on consciousness, it is treated from the material point of view. Self-consciousness here will be treated from the occult or Eastern viewpoint. Each one of us is conscious of himself as an identity or unit, different from every other individual. We know this as fundamentally as we know anything, and while we cannot prove to any of our five senses just what this identity is, this does not militate against the fact of its being a truth. The five senses inform us of material outside things, which science has catalogued and philosophy reasoned upon; but self-consciousness comes to us as an intuition, being recognized in the same way as that which we call conscience, which may be defined as a phrase of self-consciousness. It is characteristic of this

self-consciousness that it instinctively knows right from wrong, and thus tends to a recognition of morality as the way of evolution. That the consciousness of all men is in a stage of evolution is easily reasoned out. The babe has a very dim consciousness, and hence little responsibility. The drunkard or dope fiend has reduced his consciousness, and we hold him to be little accountable for what he does under such conditions. The wise man is one who has opened his consciousness to a great many things, and we expect much more of such a one and hold him to a much higher responsibility. It is not too much to say that the destiny or forward movement of the race seems to rest mainly with its wise men, those who are wise in morals as well as science. We cannot set our ideals any higher than what we can conceive of; in fact man appears to be ever setting his ideals above his actions, never quite as good or as clever as he could wish; and when he improves he sets his ideals yet higher, and so never reaches them. This condition is named the development of consciousness. There comes a time in the progress of every man when he realizes that he is higher and apart from matter—and this is true even if men have not yet attained to that realization. We are not mere animals, but are imbued with a life principle and a higher force which is higher even than the human mind. The proof of this is that a few men and women have learned to control their minds, to concentrate on a fixed point until the active mind is absolutely stilled. Any person of good intelligence can do this with practice, if he have the will and the patience, for it takes a great deal of both. That which is highest in man—call it the soul, the Divine spark, the ego or what you will—is designed to govern both the mind and body. The majority of people have little government over their bodies, and a still smaller fraction have definite control over their minds. Yet all truly great men do rule both their appetites and their minds, for thus can they rise far above the crowd and accomplish the things for which we call them great. But the self-conscious individual is one who has come to recognize this divinity of the higher nature, this attribute of the God within, and who is striving to evolve to still higher paths of usefulness, that he may serve humanity. For it is a characteristic of those who have attained the greatest degree of self-consciousness that they discover nothing higher in the way of accomplishment than the service of mankind; and if they give time and effort to developing themselves it is that they may be the more fit to serve their fellows. The intellectual materialist who has not proceeded far on the way toward self-consciousness will probably challenge some of these statements because he has not experienced them, and what he has not felt he refuses to accept, as if it were possible for any one man to have all experiences or all knowledge. These sort of truths are taught by all grades of philosophers from ancient to modern times. But without depending upon authority, each of us can ask himself the question, "What is this within me that I call I?—that sits in judgment on my acts?—that impels me toward higher things, and condemns me when I yield to lower desires?" This it is that is here characterized

as self-consciousness. The more I consult it, the more I listen to its voice, the more plainly it speaks, and it always teaches unselfishness and morality. When it is listened to, it informs a man of his faults, and thus assists him in curing them. To those who study their own consciousness it reveals other things—that they have faculties and powers, and that these appear supreme in their own domain. In other words, a man has will, which is his own, and choice, of which no one can deprive him. Will and choice send one man in search of the North Pole, another to the forefront of a battle, another to the bedside of the dying, another to the accumulation of wealth, another to a study of the stars, another to investigation of the laws of electricity, and so on *ad infinitum*. It is these qualities of finite godship which lead many to the conclusion that man is a spark of the Divine, and bound to evolve forever; that while he has freedom of will and choice for good or evil, he is never free from the hyperphysical superior will of good (or God) which always overcomes evil. Consult Steiner, 'The way of Initiation' (English trans., New York, 1910); Besant, 'A Study in Consciousness' (1900); Hudson, 'Evolution of the Soul'; Judge, 'Culture of Concentration' (1885).

CHARLES H. COCHRANE.

SELF-DEFENSE is the right to protect one's person or property from injury. The law further sanctions the mutual and reciprocal defense of those who stand in the near relation of husband or wife, parent or child. It is lawful to repel unlawful force by force, for the fundamental law in such cases is that one has a primary right to stop injury to oneself, to one's family, or those who rightfully look upon one as a protector. But it is an essential principle of law that we must not use more force than is necessary for self-defense. The law of self-defense is founded on necessity, and one in order to avail himself of this defense in law must show belief, and the reason to believe, that there was imminent danger to life, or of receiving bodily harm, and that as a reasonable person no other means of defense would be effectual; the danger must be apparent and imminent and either existing at the very time, or reasonably believed to be so. Threats alone do not justify or excuse homicide; there must be some actual demonstration of an intent to take life, or inflict bodily harm in order to establish self-defense to the extent of taking a life. In cases of mere assault it is generally held that the right of self-defense does not arise until reasonable effort has been made for protection: One who is in legal possession of property has the right to defend the same against one who manifestly intends or endeavors by violence to commit a felony, and may under certain exigencies in such defense kill his adversary. (See MANSLAUGHTER). An officer of the law authorized to make an arrest has the right to use necessary force, and if the person whom he is attempting to arrest, by resistance, brings violence upon himself, this cannot be made to justify the killing of an officer. In many of the States the principles of law respecting right of self-defense is the subject of statutes. (See ASSAULT; CRIMINAL LAW; MURDER; HOMICIDE). Self-defense in boxing is termed the "manly art," it being held that it is every man's

duty to know how to defend himself with his natural weapons in case of assault. It comprises a training in sparring or warding off blows, both fair and foul, and is a valuable acquirement taught in the United States navy. See BOXING.

SELF-DENYING ORDINANCE, in English history a measure carried through the British Parliament in 1645 by the influence of Cromwell and the Independents, by means of which generals who were either less efficient or but half-hearted in the cause were removed from the command of the army. After Manchester's lack of energy at the second battle of Newbury (October 1645), Cromwell had determined on a change of tactics, and attacked Manchester in Parliament, but he soon found the more sweeping measure a better means toward his ends. The lords threw out the measure, whereupon the Commons proceeded to form a new army under Sir Thomas Fairfax as general-in-chief. The Lords now passed the measure with some alterations and called on all existing officers to resign. Thus Essex, Waller and Manchester were disposed of, while Cromwell was specially reappointed to the command of the cavalry as lieutenant-general. For a similar measure, but one suicidal to good government, in the history of the French Revolution, see MIRABEAU; ROBESPIERRE.

SELFIDGE, Thomas Oliver, Jr., American naval officer: b. Charlestown, Mass., 6 Feb. 1836. He was graduated from the United States Naval Academy 1854, and six years later was promoted lieutenant. During the Civil War he was on board the *Cumberland* when she was sunk by the *Merrimac*, and commanded the *Cairo*, an ironclad, which was blown up in Yazoo River. He had command of a battery at the capture of Vicksburg, and was in both attacks on Fort Fisher. In 1869 he was promoted to commander, and superintended the surveys for the inter-oceanic canal across the Isthmus of Panama. He was a member of the International Congress at Paris 1876. From 1881 to 1885 he was in charge of the Newport torpedo station, when he invented a method for protecting ships from torpedoes. He became rear-admiral in 1896 and was retired 6 Feb. 1898.

SELIGMAN, Edwin Robert Anderson, American political economist: b. New York, 25 April 1861. In 1879 he was graduated at Columbia University, from which he received the degrees A.M. and LL.B. in 1884, Ph.D. in 1885 and LL.D. in 1904. After graduation at Columbia he spent three years at the universities of Berlin, Heidelberg, Geneva and Paris. He was made prize lecturer in political economy at Columbia in 1885, adjunct professor of political economy from 1888 to 1891 and full professor until 1904, when he became McVickar professor of political economy. Dr. Seligman served on the committees of 70, of 250, and secretary of the committee of 15, New York: was member of the mayor's advisory committee on taxation and finance of 1905 and of the special State tax commission of 1906. In 1908 he was member of President Roosevelt's Committee on statistical reorganization, and from 1905 to 1910 was chairman of trustees of the bureau of municipal research. In 1914-16

Dr. Seligman was chairman of the mayor's tax committee, in 1902-04 he was president of the American Economic Association, and in 1913-15 of the National Tax Association. He is president of the Society for Ethical Culture and is member of very many learned societies, American and foreign. He also edits the *Political Science Quarterly* and the 'Columbia Studies in History, Economics and Public Law.' Dr. Seligman's works include 'Railway Tariffs' (1887); 'Finance Statistics of the American Commonwealth' (1889); 'The Shifting and Incidence of Taxation' (3d ed., 1910); 'Progressive Taxation in Theory and Practice' (2d ed., 1908); 'The Social Evil' (2d ed., 1912); 'Essays in Taxation' (8th ed., 1913); 'Two Chapters on Mediæval Guilds of England' (1887); 'Economic Interpretation of History' (2d ed., 1907); 'Principles of Economics' (7th ed., 1917); 'The Income Tax' (2d ed., 1914). Other publications are to be found in the proceedings of the American Economic Association, the National Tax Association, the American Association of University Professors, and in the issues of the *Political Science Quarterly*, the *Quarterly Journal of Economics* and the *British Economic Journal*.

SELIGMAN, Joseph, American financier: b. Bayersdorf, Bavaria, 22 Sept. 1809; d. New Orleans, 25 April 1880. The eldest of eight brothers, all of them later to be united in a banking firm, with branches throughout the world, his attention was first directed to medicine and theology, but his tastes soon developed in other lines. In his 17th year he came to America and entered the employ of Asa Packer (q.v.) in Pennsylvania as cashier. He went next to Greensboro, Ala., where he opened a store, his success encouraging two of his brothers to settle in Watertown, N. Y., about 1841. In 1848, the rest of his family having emigrated, he removed to New York and organized with them an importing house which was soon among the most prominent in its line. When the Civil War began, the Seligmans established the banking firm of J. and W. Seligman and Company, with branches in London, Paris, Frankfurt and San Francisco, each in charge of one of the brothers. Joseph was offered the secretaryship of the treasury by President Grant, who felt entire confidence in his financial ability and patriotism, which had already done so much to maintain the national credit.

SELIM I, sē'līm or sē-lēm', sultan of Turkey: b. about 1465; d. Constantinople, 22 Sept. 1520. He was the son of Bajazet II, whom he succeeded in 1512 and subsequently poisoned. To secure himself on the throne he murdered his two brothers, Ahmed and Korchud, and likewise his nephews, after massacring about 40,000 Shiites in order to rid his country of a Mohammedan sect to which he was inimical. He went no further, however, than the conquest of Diarbekir and Kurdistan. He next made war against the Mamelukes of Egypt, and in 1516 obtained a victory which left him master of Syria. Following up his victory by marching against Touman Bey, he routed the Mamelukes in the plains of Gaza, and of Rudania in the following year, and then entered Cairo without opposition. Touman Bey and many others were put to death, and Egypt, which had been an independent empire since the time of the

Crusades, was incorporated with the Ottoman Empire. The title of *iman* and the standard of the Prophet were at this time granted to Selim by the last descendant of the Abassides, who at that time was residing in Egypt, and in consequence of this concession the sultans of Constantinople became the chiefs of Islam, the representatives of Mohammed. Owing to this proceeding Arabia acknowledged his supremacy. He was succeeded on the throne by Solyman I.

SELIM II, sultan of Turkey: b. 1524; d. 12 Dec. 1574. He succeeded his father, Solyman II, in 1566. The chief events of his reign were his capture of Cyprus from the Venetians in 1570 and Tunis from the Spaniards in 1571. In that year occurred the great naval battle of Lepanto in which he suffered defeat at the hands of the combined Spanish and Italian fleets.

SELIM III, sultan of Turkey: b. 14 Dec. 1761; d. 8 May 1808. He succeeded his uncle, Abdul-Hamid I, in 1789, at which time a war was in progress with Austria and Russia. The Turks were defeated, and in 1791 Selim was compelled to cede Choczim to Austria, and in the following year he signed the Peace of Jassy, which required the surrender to Russia of all Turkish possessions beyond the Dniester. He formed an alliance with Russia and England at the time of the French expedition into Egypt in 1798. Egypt was restored to Turkey by England after a temporary loss and peace was concluded with France in 1802. Selim now entered with great ardor upon a system of reforms; he established cannon foundries, and organized a corps of troops, which he armed, clothed and exercised in European fashion. This proceeding, however, was looked upon with jealousy by the people who burst into open revolt in 1807. The attempts to quell the rebellion were unavailing; the rebels marched upon Constantinople, and compelled Selim to yield the throne to his cousin, Mustapha IV. An attempt afterward made by Mustapha-Baraiktar to reinstate Selim ended in failure, and he died by assassination.

SELINUS, sē-lī'nūs, Sicily, an ancient Greek colony, founded probably about 628 B.C. on the southwest coast of the island. Its great power and wealth and the rich treasures of its temples are mentioned by Thucydides. Its disputes with Segesta were said to be one of the causes leading to the Athenian expedition of 415 B.C. and it was conquered by the Carthaginians in 409 B.C. and in 249 B.C. destroyed by them. There are still important ruins of ancient Greek temples here, and valuable sculptures belonging to them have been preserved. Consult Baedeker, K., 'Southern Italy and Sicily' (16th Eng. ed., Leipzig 1912); Gardner, E. A., 'A Handbook of Greek Sculpture' (London 1911); and Koldewey, R., and Puchstein, O., 'Die griechischen Tempel in Unteritalien und Sicilien' (Berlin 1899).

SELISH INDIANS. See SALISHAN INDIANS.

SELJUKS, sēl-jooks', a Turkish family which derived its name from Seljuk, the chief of a small tribe of the Hoi-He, which had gained possession of Bokhara and the surrounding country in the 9th century of our era. During the 11th and 12th centuries the Seljuks founded various dynasties in Mesopotamia, Persia, Syria and Asia Minor. Among the

most distinguished of these were the following: (1) The *Seljuks of Iran* or Bagdad, who ruled at Bagdad and Ispahan. This dynasty was the most powerful of them all, and boasted the most illustrious princes. The founder was Togrul Beg, a grandson of Seljuk, who in 1038 made himself master of Khorassan, a Persian province, assumed the title of sultan and obtained from the caliph of Bagdad, whose daughter he married, the dignity of governor-general or *emiral-omrah*. He subsequently completed the conquest of Persia by the reduction of Irak-Arabi and Mosul about 1061. He died in 1063, and of his successors may be mentioned Alp-Arslan (1063-73), who vanquished and made prisoner the Greek emperor Romanus; Melek-Shah (1073-93), who was the most powerful prince of the dynasty, and by means of his generals conquered and annexed to his empire Arabia, Asia Minor, Armenia, Syria and Palestine, and in the administration of the empire was signally aided by his minister Misam-el-Mouk, who was distinguished for the wisdom and moderation with which he regulated the affairs of the vast empire, and for the encouragement he gave to the arts and sciences; Mohammed-Shah (1105-18), who carried on successful wars in India and against the Crusaders; and Sanjar, who reigned from 1118 to 1158, and was one of the most illustrious of the Mohammedan princes. This dynasty became extinct in 1194 with Togrul-Shah, who was vanquished by Tekesh, sultan of Kharizm. (2) The *Seljuks of Kerman*, who ruled in the three provinces of Kerman, and never acquired the same distinction as the preceding. Founded by Kaderd, a nephew of Togrul-Beg, to whom the latter in 1039 confided the administration of these provinces. The dynasty subsisted till 1091. (3) The *Seljuks of Aleppo*, in Syria, founded in 1079 by Tutush, a brother of Malek-Shah, and to whom the latter entrusted the administration of Syria. This dynasty became extinct in 1114. (4) The *Seljuks of Damascus*, in Syria, founded in 1096 by Dekkak, a son of Tutush, who possessed himself of the city of Damascus, and whose successors reigned till 1155. (5) The *Seljuks of Iconium*, or of Asia Minor, founded by Soliman-ben-Kutulmish, one of the great-grandsons of Seljuk, to whom the Sultan Kalek-Shah granted a territory in Asia Minor. This was the longest lived of all the Seljuk dynasties. Under the reign of Alla-ed-Din II, one of the last princes of the dynasty, the Turk Osman distinguished himself as chief captain. His descendants it was who founded the dynasty of Osman in Asia Minor. The whole of the extensive empire of the Seljuks now fell under Mongol domination. Consult also Mirchond's 'History of the Seljuks,' which has been translated from Persian into German (Giessen 1838).

SELKIRK, sēl'kērk, Alexander, Scottish sailor: b. 1676; d. 1721. In May 1703 he joined Dampier's privateering expedition to the South Seas, and sailed as master in the Cinque Ports under Captain Stradling. In consequence of some difference with his commander he was put ashore on the island of Juan Fernandez (Más-a-Tierra) off the Chilean coast, and remained in his solitude till he was taken away by Capt. Woods Rogers, in January 1709. Some account of his residence was published by Steele in the

Englishman (No. 26; 3 Dec. 1713), in Rogers' 'Voyage Round the World' (1712), and in Cooke's 'Voyage to the South Sea and Round the World' (1712); but there is no reason to believe that he had any papers or journal of any sort. He is known as the prototype of the 'Robinson Crusoe' (1719) of Daniel Defoe (q.v.), who apparently derived such information as he had from Steele, Rogers and Cooke. Little of the details of the famous narrative, however, is derived from Selkirk's adventure. Consult Howell, 'Life and Adventures of Alexander Selkirk' (1829); Sutcliffe, 'Crusonia' (1843); Wright, 'Life of Defoe' (1894).

SELKIRK, Thomas Douglas, 5TH EARL OF: b. Kirkcudbrightshire, Scotland, June 1771; d. Pau, France, 8 April 1820. He was educated at Edinburgh University, and in 1799 succeeded his father in the earldom. He was active in the promotion of the emigration movement to the Red River and the colony established there was known as the Earl of Selkirk's Settlement. He published 'Sketches of the British Fur Trade' (1816); 'The Red River Settlement' (1817).

SELKIRK, Canada, town and capital of Selkirk District in the province of Manitoba, on Red River of the North, 23 miles north of Winnipeg and on the Canadian Pacific Railroad. The town has a summer resort business, considerable fishing interests, and there are large cold storage plants and government shipyards and dry docks. Pop. 2,977.

SELKIRK MOUNTAINS, a range of the Rocky Mountains, in British Columbia, from about lat. 52° to 48° N. The Columbia River is on the eastern side for some distance, and the Canadian Pacific Railroad crosses the range between the peaks Sir Donald and Glacier House at an altitude of 4,300 feet.

SELLERS, sēl'ēr-z, Coleman, American engineer: b. Philadelphia, Pa., 28 Jan. 1827; d. 28 Dec. 1907. He obtained a degree at Stevens Technological Institute and was professor of engineering practice there from 1886. He was chief engineer of the Niagara Falls Power Company, and chief mechanical engineer of the Canadian Niagara Power Company. He made numerous inventions in mechanical appliances, was a member of many American and foreign scientific societies and was widely known as a consulting engineer.

SELLERS, Matthew Bacon, American aeronautical engineer: b. Baltimore, Md., 29 March 1869. He was educated in France and Germany, took his LL.B. at Harvard University in 1902 and later studied at the Lawrence Scientific School, Harvard, and at the Drexel Institute, Philadelphia. He has been engaged in aero-dynamic research since 1900; was appointed a member of the Aerodynamic Laboratory Committee by President Taft in 1912; and in 1915 became a member of the Navy Consulting Board. He was the first to determine the lift and drift of arched surfaces by means of the "wind tunnel"; and he invented the lightest aeroplane in the world.

SELLERS, William, American mechanical engineer and manufacturer: b. Upper Darby, Pa., 19 Sept. 1824; d. 1905. He was apprenticed to a machinist, and in 1848 became a member of

the firm Bancroft and Sellers, which in 1855 became William Sellers and Company, manufacturers of tools. He made many improvements in tools and invented many new appliances. He suggested the first formula ever offered for screw threads and nuts, which has since become standard in United States and Europe. He was president of Franklin Institute in 1864-67. He became president of the Edge Moor Iron Company in 1868, and in 1873-87 directed the Midvale Steel Company, Nicetown, Pa., manufacturing materials for small arms and ordnance for the government. He was elected to the National Academy of Sciences in 1873.

SELLERS, Col. Mulberry, the name of a character in the novel, 'The Gilded Age,' by Mark Twain and Charles Dudley Warner. He was a visionary Southern speculator, and was created on the stage by John T. Raymond.

SELLEW, Walter Ashbel, American Methodist Episcopal bishop: b. Gowanda, N. Y., 27 Feb. 1844. In 1866 he was graduated at Dartmouth, from which he received the degree of A.M. in 1869. In 1872 he was ordained to the ministry of the Free Methodist Church; held pastorates successively at Tonawanda, N. Y., Rochester, N. Y., Spring Arbor, Mich., Dunkirk, N. Y., Gerry, N. Y., Allegany, N. Y., and Buffalo. In 1887-98 he was presiding elder at Chautauqua, Allegany, Buffalo, Oil City, Bradford and Pittsburgh districts. On 15 Oct. 1898 he was elected bishop. He is treasurer of the Gerry (N. Y.) Home for Aged Persons and the Gerry Orphanage. He is also president and treasurer of the A. M. Chesebrough Seminary, North Chili, N. Y.; is member of the executive committee and of other governing boards of the Free Methodist Church. He made an official missionary tour around the world in 1906 and again visited China and Japan in 1910. Bishop Sellew published 'Clara Leffingwell, a Missionary' and other religious publications.

SELLSTEDT, sēl'stēt, Lars Gustaf, American painter: b. Sundsvall, Sweden, 30 April 1819. He came to the United States in 1834, and subsequently served in the United States navy. After settling in Buffalo, 1842, he devoted himself to the study of art, and in 1875 was elected a National Academician.

SELMA, Ala., city, county-seat of Dallas County, on Alabama River, at the head of year-round steam navigation, and on Louisville and Nashville, Southern Railway and Western Railway of Alabama, 50 miles west of Montgomery, 158 miles north of Mobile and 98 miles south of Birmingham. It has steamer connections with Mobile, is located in a rich agricultural section, known as the Black Soil Belt. Cotton, livestock and forage crops are the chief products. The principal industrial establishments are cottonseed-oil mills, cotton factories, iron works, railroad shops, woodworking plants and brick-yards. It is the jobbing centre for a large territory and markets a great amount of cotton. Educational institutions include Alabama Methodist Orphanage, Convent of Mercy, Carnegie library and a well-equipped public school system. Selma University for negroes is also located here. The four banks, two national and two State, have a capital and surplus of

over \$2,000,000. During the Civil War the city was the centre of military operations, and had a Confederate navy yard, arsenal, powder works and artillery foundries. It was captured by the Union forces on 2 April 1865, when the army under General Wilson burned the business district. Pop. about 18,500.

SELMA (Ala.), *Battle of*, an engagement of the Civil War, 2 April 1865, one of the battles of General Wilson's cavalry raid in the operations against Mobile. The Union cavalry camped at a point 19 miles north of Selma on 1 April and on the morning of the next day began the movement against the town. One division advanced from the north on the Sumnerville road, and a second division from the northeast on the Burnsville road, while a third division was dispatched to burn railroad bridges, trestles, stations, etc., as far as Burnsville. The troops were in position before Selma by 4 p.m. and, dismounting, assaulted and carried the works at a single charge, the distance over which they charged, exposed to the enemy's fire, being 600 yards. The Selma fortifications consisted of a bastion-line with a radius of three miles; the Confederate force on the line against which the charge was made was over 1,500; the Union force engaged numbered 1,550. The Federals captured 31 field-guns, a large number of prisoners and quantities of stores of all kinds. Consult 'Battles and Leaders of the Civil War' (Vol. IV).

SELOUS, *Capt. Frederick Courtney*, famous big game hunter: b. London, 31 Dec. 1851; killed in action, East Africa, 5 Jan. 1917. Of mixed French, English and Scottish parentage, he was educated at Rugby, Neuchâtel and Wiesbaden, and at 19 set out for Africa to become an elephant hunter. After spending a time on the Kimberley diamond fields he entered the wild Matabele territory (now Southern Rhodesia) and obtained permission from the savage chieftain Lobengula to carry out his object. By the time he was 25 Selous was known as the most daring and successful ivory hunter in Africa. Nor did he restrict his activities to elephants alone; lions, hippo and rhinoceroses fell to his unerring rifle. In 1889 he traveled down the Zambesi to the sea and in 1890 led the pioneer expedition of the Chartered Company into Mashonaland and secured that territory for Britain. He fought in both the Matabele wars, and in later life resumed his hunting adventures. In 1909-10 he organized and accompanied Colonel Roosevelt's hunting expedition in British East Africa. Though over 60 years of age he offered his services for the war; was gazetted lieutenant in the Royal Fusiliers in 1915 and captain a few months later. In September 1916 he received the D. S. O. "for conspicuous gallantry, resource and endurance." Selous wrote 'A Hunter's Wanderings in Africa' (1881), a book regarded as a classic on hunting, and summarized his vast stores of knowledge about African wild game in 'African Nature Notes and Reminiscences' (1908). He also published 'Travel and Adventure in Southeast Africa' (1893); 'Sunshine and Storm in Rhodesia' (1896); 'Sport and Travel, East and West' (1900), and 'Recent Hunting Trips in British North America' (1907). Selous was the original model of 'Allan Quarter-

main' in Rider Haggard's romance of that name. His eldest son, Capt. F. H. B. Selous, attached to the Royal Flying Corps, also fell in action, on 4 Jan. 1918. A brilliant scholar and a fine athlete, he had been awarded the Military Cross and the Italian Silver Medal of Military Valor. He was 19 years old.

SELUNGS, a race of men, now few in number, and of doubtful affinities, but usually classified as Indonesian, inhabiting the Mergui Archipelago and other islands along the eastern coast of the Bay of Bengal. They live almost wholly in boats made of palm-leaf ribs sewed together by threads of coir and subsist almost exclusively on sea-food, to which fact is attributed the prevalence of leprosy among them. Their principal industry is the gathering of edible birds' nests from the towering cliffs of granite by means of immensely long bamboo ladders. They also gather some mother-of-pearl and other salable shells with which they occasionally come to the ports on the mainland to trade for cloth, etc. They are despised by both the Burmese and Malays, with whom they most often come into contact.

SELVAGE. See **GOUGE**.

SELWYN, *səl'wīn*, **Alfred Richard Cecil**, Canadian geologist: b. Kilminster, Somerset, England, 28 July 1824; d. 1902. In 1845 he was appointed assistant on the Geological Survey of Great Britain and in 1852 director of the survey of Victoria, Australia, which was not completed until 1869, when he was appointed director of the Canadian survey, completed in 1895. He also investigated the coal and gold fields of Tasmania in southern Australia in 1854-59. He is a Fellow of the Royal Society. His writings include, beside some odd volumes of reports of geologic and natural history survey, portions of Stanford's 'Compendium of Geography and Travel.'

SELWYN, **George Augustus**, English wit and politician: b. Gloucestershire, 11 Aug. 1719; d. London, 25 Jan. 1791. He was educated at Eton and Oxford, but quitted Oxford before graduating on account of a reputed insult to the Christian religion. He was appointed to several offices at the mint involving no work and bringing him a small salary. In 1747 he entered Parliament for Ludgershall and from 1754 to 1780 sat for the city of Gloucester. He never spoke at Parliament, but his vote being always cast with the court party secured him lucrative appointments. He was a famous wit at the clubs and an intimate of the Duke of Queensbury, Horace Walpole and Lord Carlisle. Consult Jesse, 'George Selwyn and His Contemporaries' (1843).

SELWYN, **George Augustus**, English bishop: b. 5 April 1809; d. Lichfield, 11 April 1878. He was educated at Eton and at Cambridge; rowed in the first inter-university boat race (1829). His remarkable powers as an athlete were found very serviceable in after life. In 1841 he was consecrated bishop of New Zealand and Melanesia, a territory since then divided into seven dioceses. On the voyage out he studied Maori and navigation and in his own vessel visited every portion of his diocese before setting about the work of organizing it. A visit to England in 1854 brought back John Coleridge Patterson, afterward bishop of Melanesia, where he was murdered by the na-

tives. In 1867 Bishop Selwyn attended the first Pan-Anglican Synod at Lambeth and was appointed bishop of Lichfield. He was present at the General Convention of the American Episcopal Church at Baltimore in 1871.

SELWYN COLLEGE, Cambridge, England, founded in 1882 in memory of George Augustus Selwyn, bishop of Lichfield, is an institution meeting the requirements of Anglican theological students, on a more economical basis than those of the older established colleges, "combined with Christian training according to the principles of the Church of England."

SEMANTUS (SEMASIOLOGY, or the SCIENCE OF MEANINGS). See LANGUAGE, SCIENCE OF.

SEMAPHORE, a term originally applied to the moving arm of a signaling post in a system of coast telegraphy adopted by the French in 1893, and subsequently to any kind of signaling arms moving round pivots placed at or near their extremities. The semaphore, from the ease and rapidity with which the movable arms could be worked, was much superior to any telegraph previously in use. The French semaphores consisted of two or three movable arms, mounted on posts and turning upon separate pivots, one above the other. These were mounted on the top of towers, erected in commanding positions at distances of from 5 to 10 miles apart. When signals were made at one tower they were read off at the next by means of a powerful telescope, and then transmitted to a third, and so on, if necessary, to the end of the series. In this way a message might be dispatched with great rapidity. In 1809 Captain Pasley, an English officer who had previously constructed what he termed a polygrammatic telegraph, saw the French semaphore, and applied the principle of it to his own telegraph. As thus modified it consisted of three opposite pairs of arms pivoted on a post at certain intervals, representing hundreds, tens and units. Till 1816 the British Admiralty had employed a telegraph which had been submitted in 1795 by Lord George Murray and which consisted of several shutters placed in a vertical frame, by the opening and closing of which the signals were made. In the year named it was determined to substitute, for these telegraphs, semaphores constructed on the principle of those used in France, with certain improvements suggested by Sir Home Popham. In Popham's semaphore there were only two arms, but these being upon separate pivots, though on the same post, each of them could be made to assume six different positions, and in combination the two could give 48 signals, a number more than sufficient to express all the letters of the alphabet, together with the nine digits. The vertical post of this semaphore was a hollow hexagonal mast, which passed through the roof of the tower, and being fixed upon a pivot it could be made to turn so as to display its signals in any direction. It was not till the introduction of the electric telegraph that government semaphore stations were abandoned. For the modern semaphore, see BLOCK SIGNAL SYSTEM.

SEMBRICH, zēm'brīh, Marcella, Austrian opera singer: b. Lemberg, Galicia, 15 Feb. 1858. She studied violin and piano at first, her mas-

ter on the latter instrument being Franz Liszt. When it was discovered that she had a remarkable voice she went to Milan to study with Lamperti, and made her first appearance at Athens in 'I Puritani.' Shortly afterward she became attached to the company of the Royal Opera House, Dresden, and remained until 1880. That year she appeared first in London. She came to the United States in 1883, since which time she has reappeared here in several seasons of concerts and opera. In 1903-04 she was the leading coloratura soprano at the Metropolitan Opera House. Her repertory embraces a wide range of Italian operas.

SEMECARPUS, a genus of trees of the *Anacardiaceæ*, containing about 35 species. The marking-nut tree (*S. anacardium*) is the most important species. The pericarp of its fruit furnishes a juice greatly used in India for printing cotton cloth, for ink and for dye. It is also employed for warding off white ants and for a medicine in rheumatism, warts and leprosy. When pounded and boiled in rapeseed-oil it stays putrefaction when started in hides. The seed itself, which is called Oriental cashew-nut or melacca bean, and the fleshy pedicel are eaten by the natives. The resin of this species yields Sylhet varnish and an oil derived from it mixed with the milk of euphorbia is made into birdlime. This species is cultivated to a limited extent in southern Florida.

SEMELE, sēm'ē-lē, according to Greek mythology, the mother by Zeus of Dionysus or Bacchus, the god of wine.

SEMERARA, sā-mā-rā'rā, (1) A group of islands of the Philippine Archipelago lying two miles south of Mindoro, in the channel between Mindoro and Panay. The group consists of eight islands and a number of small islets; area, 60 square miles. The people are Visayans, and are mostly engaged in turtle and trepang fishing. Pop. 500. (2) The largest island of this group, area, 35 square miles. It is hilly, the highest elevation being 512 feet. The west coast is indented with several bays, but none afford good anchorage; there is sheltered anchorage to the south of the island during the northeast monsoon. Coal of good quality is found, especially in the north.

SEMI-AUTOMATIC GUNS. See ORD-NANCE.

SEMINOLE (sēm'ī-nōl) **INDIANS** (Creek Simanoli, "separatist," "renegade"). An important tribe of the Muskogean stock of American Indians. The name was originally applied to those Creeks and Hitchitis on lower Chattahoochee River who left the main body about 1762-68 and removed to the peninsula of Florida, in the territory that had been occupied by the Appalachis who were practically exterminated some 60 years before, although some Creeks, who later became part of the "Seminoles," have resided in the southern part of Florida since the middle of the 16th century. The separation of the Creeks and Hitchitis from their northern kinsmen was due chiefly to overpopulation of the older towns, followed by turbulent and undesirable elements, criminals and desperadoes (whence the opprobrious application of the term Lemicea by the Creeks who remained at home, and the forcible migration of others owing to the encroachments of

civilization). The Hitchiti elements consisted principally of Mikasukis; there were also probably some Yamasis, and certainly some Yuchis and negroes. The Seminoles are known to history chiefly through their two wars with the United States—the first in 1817-18, provoked by the upper Creeks, the other in 1835-42, which was the bloodiest and most furiously contested struggle with Indians in which the government has ever engaged, resulting from the refusal of a part of the Indians to remove to the Indian Territory, under the provisions of a treaty agreed to by them in 1834, in which they ceded their lands in Florida to the United States. On the final surrender of the hostiles, in 1842-43, the Seminoles (with the exception of some who fled to the swamps) to the number of 3,824, were moved to the West, where they now form one of the five civilized tribes of the Indian Territory, the others being the Cherokees, Choctaws, Chickasaws and Creeks. The Seminoles in 1915 numbered 3,129 (including some negroes and adopted white). The total area of their nation comprised 365,852 acres, of which 1,932 acres were reserved for town sites, railroad rights of way and other purposes. With the exception of a few minor details the tribal affairs of the Seminole nation were practically completed in 1915 and the nation incorporated in the United States.

SEMINOLE WAR, the second of the two wars in which the Seminole Indians of Florida engaged against the United States, the first having been a short conflict in 1817-18, which was ended by General Jackson, who destroyed villages of the Indians and wholly subdued them. The second, which is that usually referred to as the Seminole War, began in 1835 and ended in 1842, and was the fiercest of all wars waged by the United States against Indians. It began in consequence of the refusal of a part of the tribe to make a cession of its lands in Florida and submit to removal to the Indian Territory, in accordance with the terms of a treaty ratified in 1834. On the Indian side the war was at first conducted by the celebrated chief Osceola (q.v.), with whose name it is largely associated; and on the part of the United States it was carried on by Scott, Taylor, Jesup and other commanders. After a protracted struggle the Indians were completely subjugated, and in 1843 about 4,000 of them were removed, those who arrived in the Indian Territory forming one of the five civilized nations now located there.

SEMIPALATINSK, sē-mē-pā-lā-tīnsk', or **SEMIPOLATINSK**, Asia, in Siberia, (1) capital of a province of the same name, situated on the left bank of the Irtysh River. It is fortified and the chief points of interest are the government buildings, offices, mosques, churches, bazaars and barracks. There is considerable trade with Kirghiz, Tashkend, Khokand, Bokkara and Kashgar.

(2) The province of Semipalatinsk covers an area of 178,128 square miles. The Alexandrian Mountains separate it from Turkestan on the south. Several other ranges traverse its territory. The principal streams are the Irtysh, Ili and Chui. The lakes: Issik-Kul, Ala-Kul and Balkash. Cattle raising forms the only industry of the inhabitants. Some lead and copper, etc., occur. Its climate is comparatively

mild. Apricots and apples are spontaneous. Pop. about 690,000.

SEMIPALMATED SANDPIPER. See **SANDPIPERS**.

SEMIRAMIS, sē-mīr'a-mīs, a fabulous queen of Assyria. She was a daughter of the fish-goddess Derceto of Ascalon, in Syria, by a Syrian youth. Being exposed by her mother, she was miraculously fed by doves until discovered by the royal shepherds, the chief of whom, Simmas, took her to his own house and brought her up. Her surpassing beauty, according to Ctesias, having attracted the notice of Onnes, the governor of Nineveh, he married her. She subsequently accompanied her husband to the siege of Bactra, where by her advice she assisted the king's operations. Captivated by her abilities as well as by her beauty, Ninus, the founder of Nineveh, asked her of her husband, who refused to yield her, and when Ninus added threats to entreaties hanged himself. As queen of Assyria, Semiramis built Babylon, adding fine buildings and hanging gardens. She led campaigns against Persia, Egypt, Libya and Ethiopia. Finally with a host of 3,000,000 foot, 500,000 horse and 100,000 war-chariots she engaged in battle with King Stabrobates and was defeated in a battle on the Indus with the loss of one-third of her forces. Upon this it is said she vanished in the shape of a dove or slew herself. Evidently she has no existence in history. She is the goddess of war and of love, the Istar of the Assyrians, to whom the dove was sacred. Consult Lenormant, 'La Legende de Semiramis' (1873).

SEMITES, a name given by J. G. Eichhorn in 1787, in his 'Introduction to the Old Testament' (2d ed., i, 15) to a group of nations allied in language, religion, manners and physical features, represented in Gen. x, as descended chiefly from Shem, a son of Noah. Their habitat is Abyssinia, Arabia, Palestine, Phœnicia, Syria and the countries of the Euphrates and Tigris. Into those lands, according to one theory which is supported by Lenormant and others, there had preceded them an immigration of Cushites of the Hamitic race, who, proceeding from central Asia, occupied not only the lands that afterward became Semitic, but also the Nile Valley. Their Hamitic language and civilization the Semites are said to have adopted. In language the Semites do show some affinity with the Berbers and the inhabitants of the Nile Valley, and Gen. x does, for political and geographical or other reasons, distribute the sons of Ham and Shem in a peculiar manner. But the increasingly prevalent theory is that not less than 4,000 years B.C. the Semites migrated as nomadic tribes, probably from Arabia into Mesopotamia. There they found a Turanian population dwelling in cities built of brick, under the regular government of priest kings, skilled in the use of metals, using the cuneiform mode of writing, and comparatively far advanced in literature and culture. The hold of the Semites on Shumir, the lower, more fertile and more thickly inhabited part of the Euphrates Valley, was not at first so strong as on Accad, the upper part. In 3800 B.C. the Semitic adventurer Sharrukin usurped the kingdom of Accad. In Elam also the Turan-

ian population was early overpowered by the intruding Semites, who came to form the upper strata of society. In 2280 B.C. the Semite Khudur-Nankhundi of Elam invaded and conquered Shumar and Accad, founding the Elamite line of princes; and about 2200 B.C. one of his successors, Khudur-Lagamar (Chederlaomer), carried his conquests as far as Palestine (Gen. xiv).

These painful and oppressive impulses, and probably others like them, seem to have occasioned emigrations of many Semites. Some proceeded toward the northwest, reached the Mediterranean Sea, founded Sidon, Tyre and other cities and became known afterward as Canaanites or Phœnicians. Later, from Ur went others in the same direction, settled behind the Phœnicians and were afterward known as Israel. Others went north and built cities which developed into the empire of Assyria. While the Semites were in Mesopotamia they used the Turanian language in their public documents till they attained the ascendant in political power; and when afterward they used their own language they continued to use the Turanian cuneiform mode of writing. The Turanian religion also was adopted by the Semites, and mixed with what religion their own primæval tribal religion or totemism had developed into. This amalgamation was consummated by Sharrukin II of Accad about 2000 B.C.

The Semites as a race have a fine physical organization, are mentally quick, clever but not inclined to change, and not persistent in progress. They have been distinguished by a brilliant imagination and love of the beautiful; but have not shone in philosophy or in science. Their literature has neither epic nor dramatic poetry worth notice. Almost their only arts are the sculpture of Assyria, the exquisite glass and pottery and the textile fabrics and embroidery of the Phœnicians. Impatient of restraint, the Semites have not by political aptitude welded together themselves or others into large, compact and enduring commonwealths. They have made their mark on the world in the Phœnician commerce, which visited even the Atlantic shores of Spain and France and drew tin from Britain; in the Phœnician colonies, which, dotting all the coasts and many islands of the Mediterranean Sea as far as Cadiz, and the coast of Asia as far as India, dispensed manufacture, developed primitive navigation (even to the extent of circumnavigating Africa more than 2,000 years before Vasco da Gama), stimulated industry, trade and ingenuity, and radiated the light of material civilization; in the Carthaginian Empire within Europe and Africa; in the exploits of Hannibal; in the dissemination of alphabetic writing, whereof the Phœnician form was the mother of the European and of most Asiatic alphabets, while the alphabet of the great Sabaean kingdom, or of the great and still more ancient Minæan kingdom in Arabia, is apparently the eldest of all alphabets hitherto discovered; in the Babylonian and Assyrian empires; in the Hebrew Bible and the Jewish religion; in the New Testament and the Christian religion; in the Koran and the Mohammedan religion; in the Mohammedan conquests and empire, and in the preservation of culture thereby during the Dark Ages and the

Middle Ages. The difficulty of generalizing with exactitude as to the origin and character of the Semites is increased, as Nöldeke has shown, by the fact that we assume that the most important traits of some Semitic peoples are common to all. In reality some striking features which are ascribed to racial influence are due to external conditions of life, which under similar circumstances are also developed among non-Semitic races. Linguistically, too, it is a no less formidable task to understand aright the kinship of the Semites. They are usually divided into two groups — Northern and Southern. The latter include Arabs, Yemenites, Abyssinians; the rest compose the Northern, whose classification is less happy, as their relationship to each other is less close. As to Semitic origins, it is usually held that Arabia was the Semitic cradle-land, with North Africa that of the Hamito-Semitic race. It is now doubted that they originated in certain districts in Armenia, while the ingenious theory of an eminent Italian Orientalist, Guidi, that the lower Euphrates was their home meets equal disfavor. Consult Brinton, 'Races and Peoples' (New York 1890); Ripley, 'Races of Europe' (1901); Barton, 'Sketch of Semitic Origins' (New York 1902).

SEMITIC LANGUAGES, the languages spoken by the nations of whom Shem was considered the common ancestor. The word Semitic comes from the Septuagint form of the name Shem, Shemitic, derived directly from the Hebrew, being much less frequent. The Semitic languages form a group somewhat like the Aryan group, although the relationship of the different languages is much closer. The members of the group do not entirely correspond to the list of the descendants of Shem given in Gen. x, 21-31; Elam, for example, which is included, in x, 22, was not a Semitic people, while the Canaanites, including the Sidonians, who were Semitic, are given in x, 15 among the descendants of Ham. Such facts indicate that the table of nations in Gen. x was not entirely ethnological, but at least partly geographical: the nations were grouped according to their geographical distribution in the time of the writer.

General Divisions.— The Semitic languages are often divided into two main divisions, Northern and Southern. But the former can be divided into three groups, Eastern, Northern and Middle, which are separated from each other by differences very nearly as great as those between the two divisions first mentioned. It seems better, therefore, to recognize the general division as fourfold, into Eastern, Northern, Middle and Southern Semitic languages.

The Eastern Branch.— The Eastern branch includes the Babylonian and Assyrian languages. Assyrian is really a dialect of Babylonian, there being but very slight phonetic differences between the two, although the difference is somewhat greater in the form of the characters. Babylonian is found much earlier than Assyrian and also continues somewhat later. The Babylonian inscriptions thus far found begin probably about 4000 B.C., possibly somewhat earlier, and extend to the capture of Babylon in 538 B.C. Babylonian was also used later as a literary language under the Persian and Greek rulers of Babylonia. Assyrian inscriptions ex-

tend from about 1800 B.C. to shortly before the fall of Nineveh in 606 B.C.

The Northern Branch.—The Northern Semitic or Aramaic branch includes many languages and dialects, to all of which the general term Aramaic is applied. The oldest Aramaic literature is found in the inscription of Zakkūr, 9th to 8th century B.C., and in the inscriptions from Senjirli, of the 8th century B.C., some words on Assyrian and Babylonian tablets being only a little later. The language of these inscriptions differs very much from the later Aramaic languages and resembles the Canaanite language in many particulars. The Aramaic languages are divided into two principal branches, Western and Eastern, the geographical distribution of which was largely in harmony with these names. Western Aramaic may be called one language, with the following principal dialects: Biblical Aramaic, being the language of portions of the Old Testament books of Daniel and Ezra, and of a few words elsewhere in the Old Testament; Targumic Aramaic, usually so-called, the language of the Palestinian Targums; the similar language of most of the Gemara of the Palestinian Talmud and of the Palestinian Midrashim, which is also found in small parts of the Mishna, and also of the Babylonian Gemara; Samaritan, the language of the Samaritan Targum to the Pentateuch; the language of some Jewish inscriptions and papyri from Egypt, dating somewhat before the time of Christ; the language of the few Aramaic words found in the New Testament; the language of the inscriptions found in Tadmor or Palmyra; and the language of the Nabatean inscriptions found in Idumea and vicinity. The only modern representative of Western Aramaic is the language spoken at the present time by a few people near Damascus, in and near the village of Malula, which is written in the Syriac character but belongs in this class. Eastern Aramaic includes Syriac, Mandaic, being the language of the Christian sect of Mandæans who lived east of the Tigris, and the language of the most of the Babylonian Gemara. Syriac was the language of the Christian Arameans and was employed in an extensive literature, chiefly of an ecclesiastical nature, extending from the 2d to the 13th century A.D., including the translation of the Bible known as the Peshitta. The word Syriac means the same as Aramaic and was adopted by the Arameans from the Greeks, because the word Aramaic had come to be used as meaning heathen. After the separation of the two sects known as the Nestorians and Jacobites, each developed its own dialect, known as the Nestorian and the Jacobite, respectively. The actual dialectical differences are but slight, chiefly in the pronunciation of the vowels. In writing, somewhat different forms of the characters were used and the vowels were represented by entirely distinct systems, in the Nestorian dialect by dots, in the Jacobite by characters borrowed from the Greek. The modern representative of the Nestorian branch is the language used by the Nestorian Christians, in parts of Persia, especially in the city of Urmia and vicinity, in some villages in Kurdistan and in portions of Mesopotamia. This language shows very many changes from ancient Syriac, those in the verb being especially striking, while the vocabulary has received very many foreign words, especially from Arabic, Persian and

Kurdish. Further, this language shows forms not found in Syriac, but preserved in other Aramaic languages as well as in some of the other Semitic languages, so that it is evidently descended not from ancient Syriac itself, but from a closely related dialect. There are four principal dialects of modern Syriac, that used in Urmia and vicinity, that of northern Persia and some adjacent regions in Turkey, that of Kurdistan and that of Mosul and vicinity. While the language is the same in all these, yet there are very many dialectical variations. The modern representative of the Jacobite Syriac is the language of Tur Abdin, in western Kurdistan, which is similar to the modern Nestorian language, but with many differences.

The chief general feature that distinguishes the Eastern and Western Aramaic languages is the preformative of the imperfect. This is *y* in all the Western Aramaic dialects, although a few forms with *l* are found in Biblical Aramaic, and *n* in all the Eastern, although Mandaic and the Babylonian Talmud have *l* along with *n*. In modern Syriac the verbal form is so much different that no preformative is used.

The Middle Branch.—The middle Semitic branch is also called Canaanite, for all its languages are often included under the general term Canaanite. The only one of these languages in which much literature has survived is the Hebrew. Nearly all of the Old Testament is in ancient Hebrew. Aside from this, the oldest Hebrew documents are probably about 75 inscribed potsherds found at Samaria in 1910, written in ink by a reed pen, containing brief business memoranda. These are usually ascribed to the time of Ahab, the first half of the 9th century B.C. A small limestone calendar tablet was found at Gezer in 1908 and is assigned to the 8th century. The Siloam inscription is usually dated at about 700, but is possibly much later. Various inscribed Hebrew seals have been found, dating perhaps from the 8th century on. Coins with Hebrew characters are from the 2d century B.C. to the 2d century A.D. New Hebrew or Mishnaic Hebrew is found chiefly in the Mishna, and also somewhat in the Gemara and in related works. Hebrew has continued to be used somewhat by the Jews as a literary language even to the present time, most of the later literature being produced in the Middle Ages. The language as thus used is ordinarily similar to Mishnaic Hebrew. The Phœnician has much that is identical with the Hebrew, while the differences are slight, affecting the vowels more than the consonants, although the vocabulary shows some variations. It is found in inscriptions from Phœnicia and her colonies, prominent among the latter being Carthage, where the language was called Punic. Considerable portions are also found quoted in works of Latin and Greek authors, chiefly in the Pœnulus of Plautus. Most of the Phœnician inscriptions are from the 4th century B.C. and later, some are as old as the 6th century, while the oldest inscription may belong to the 8th century or a little earlier. The inscription of Eshmunazar, from the time of Alexander the Great, is the most important. In this group are also included the Canaanite, Moabite, Ammonite and Edomite languages. The last two are known only from the proper names found in the Old Testament and the inscriptions of other nations,

the Moabite from that source and also from the Moabite stone, written by Mesha, king of Moab, and dating from about 850 B.C. The Canaanite, aside from information given in the Old Testament, is known from glosses found in the Tell el-Amarna tablets (see **AMARNA LETTERS**) about 1400 B.C. All four are substantially identical with Hebrew, the Canaanite and Moabite, which of course are known more fully than the other two, showing slight dialectical variations. Moabite and Phœnician, like Hebrew, have *waw* consecutive with the imperfect. Some of the Philistine proper names given in the Old Testament are Semitic. It is generally agreed, however, that the nation was not Semitic, but perhaps learned and used the common Canaanite language after their arrival in Palestine.

The Southern Branch.—The Southern Semitic branch is sometimes called the Arabic group, because the Arabic language is its most important representative. Under Arabic may be included ancient or classical Arabic, its descendant, modern Arabic, and southern Arabic, often improperly called Himyaritic, including the closely related dialects of Sabæan and Minæan. The great work in ancient Arabic is the Quran, composed by Mohammed (570–632 A.D.), although a few poems are older than this. Printed modern Arabic is substantially the same wherever found and does not differ greatly from the ancient language. The spoken language, however, is divided into many dialects, of which the most important are those of Syria, Egypt, Mesopotamia, Tunis, Malta and Oman and Zanzibar. Under the general head of modern Arabic may be included the very extensive Arabic literature from soon after the time of Mohammed down to the present time. Sabæan and Minæan are found in inscriptions, chiefly in southern Arabia. These are of uncertain date, although it is now often claimed that the earliest Minæan inscriptions are earlier than 1000 B.C., while the oldest Sabæan are somewhat later. Modern representatives of these dialects are found in the present dialects of the same region, of which little is known, two of them being the Mahri and the Socotri. Included in the Southern Semitic branch is also Ethiopic, or more properly Geez. This was probably a descendant of Sabæan. The ancient Ethiopic was the language of Abyssinia. It closely resembles the Arabic dialects, sharing with them some of their most characteristic features, while in many other respects it differs greatly from them. It was the spoken language of Abyssinia till about the 13th century A.D. The earliest known literature comes from about 500 A.D. Most of the literature consists of translations from other languages. The most important documents are the translation of a part of the Bible, made about 500 A.D., and the apocryphal book of Enoch, which is a translation from a lost original. Modern representatives of the language in the same region are the Tigré, the Tigrina and, with extensive incorporation of foreign elements, the Amharic, together with dialects related to the Amharic, such as the Harari and Guraguë.

The Egyptian language is by some classed as Semitic. It seems evident, however, that that is not the case, but that very early, in prehistoric times, it was subjected to strong Semitic

influences, doubtless from invaders coming from Asia.

The Written Characters.—The written character of the Babylonian and Assyrian languages is the cuneiform, the writing being partly ideographic and partly syllabic, but not at all alphabetic. (See **CUNEIFORM WRITING**). This, however, according to the common view, was not the invention of the Babylonians, but was taken by them from the earlier inhabitants of the land, the non-Semitic Sumerians. It was originally a picture writing, like the hieroglyphics of the Egyptians, but has been so largely conventionalized that in most cases the resemblance to the original picture has been lost. The Assyrian forms, when they differ from the Babylonian, show modifications in the direction of greater conventionalizing and increased regularity. Aside from the cuneiform, all Semitic languages use an alphabet, consisting entirely of consonants, which goes back to the same original forms. Ethiopic is an apparent exception, in that the vowels are written with the consonants, that is, each consonant has six or more different forms according to the vowel following it. These forms have such a resemblance to those of the other Semitic languages, however, and in particular to the Sabæan which is written without vowels, that it is probable that the earliest form contained simply the consonants, and that the modifications of form for the expression of the vowels show a later development. What is commonly regarded as the earliest form of the Semitic alphabet is usually called the Phœnician, a name given to it by the Greeks because they obtained it from the Phœnicians. But the Phœnician alphabet at the time of our earliest knowledge, about the 8th century B.C., was practically identical with the forms found at about the same time among the other Canaanites and the Aramaeans. The origin of this alphabet is doubtful, the common view at the present time being that it was derived from certain Egyptian characters, while some regard it as taken from the Babylonian. After the Greeks obtained this alphabet, it passed from them to the Romans and then to the many modern alphabets derived from the Greek and Latin. The earliest inscriptions known in this alphabet are probably the ostraka from Samaria in Hebrew, of the 9th century, the Hebrew Gezer inscription, of the 8th century, the Moabite stone, about 850 B.C., in the Moabite language, a Phœnician inscription of about the same date, the Siloam inscription, about 700 B.C., in Hebrew, the Zakkûr inscription and the inscriptions from Senjirli, about the 8th century B.C., in Aramaic. All these have substantially the same forms. Within the next few centuries two types gradually arose, the old Hebrew and the Aramaic or square characters. The old Hebrew was used in writing Hebrew till the Jews adopted Aramaic as their vernacular, which was at any rate before the time of Christ, when they naturally came to use ordinarily the Aramaic form of character for the Hebrew as well. The Samaritans have always used the old Hebrew form of character, with many changes, especially in the direction of greater elaborateness. The only modern use of this form of character is in the Samaritan of the present day.

The earliest Syriac character, known as the Estrangela, was a cursive writing developed

from the Aramaic form. From this came the later Syriac forms, both Nestorian and Jacobite, and also the Arabic characters, including both the Kufic and the Neskhi.

The southern Arabic characters, found in Sabæan and Minæan, differ greatly from those already mentioned, and are perhaps earlier than any other forms which have been found. They are to be traced, however, to the same common character in an early form. The Ethiopic character is a development of the southern Arabic form.

The Ethiopic language and the Assyrian and Babylonian are written from left to right. All the other Semitic languages are written from right to left.

General Characteristics of the Semitic Languages.—The modern Semitic languages and dialects have of course been greatly changed by the influence of the other languages with which they have been brought in contact. These, therefore, should not receive a prominent place in the consideration of the general characteristics of the Semitic languages, although they may offer confirmatory testimony in some particulars. Some of these general characteristics of the ancient Semitic languages may well be noted, keeping in mind a comparison with other languages, especially with the Aryan group. It is not claimed, of course, that the characteristics which will be here named have no similarities elsewhere, but rather that they may fairly be considered general characteristics of the Semitic group, as they could not be of any other group.

The Semitic languages divide the letters into two general classes, consonants and vowels, the consonants being the more important. Roots are composed only of consonants, while the vowels are used, along with consonantal changes, to express modifications of the fundamental root idea. Although the vowels are thus important, it is in a domain entirely subordinate to the consonants. The result of this is that in all the languages except the Assyro-Babylonian and Ethiopic the consonants only were originally written, and the vowels added by means of small marks, for the most part above or below the consonants. In fact, it was only in comparatively late times that the vowels were written at all. The inscriptions, such as those of Phœnicia and of Senjirli, the Moabite stone and the Siloam inscription, have no vowels. In the Assyro-Babylonian the vowels are expressed, but the characters are usually supposed to have been borrowed, as has already been noted. In the Ethiopic the vowels are expressed by slight changes in the form of the consonant, a feature, however, which is probably to be regarded as a late development, although going back to the earliest known literature. The consonants alone were probably originally written.

Originally the Semitic languages were characterized by the possession of a large number of gutturals, some of them very peculiar. In course of time, however, part of these were lost by most of the languages, the Arabic preserving them the most fully.

The Semitic roots are almost entirely triliteral, that is, each consists of three consonants. An occasional root is found which contains four or more consonants, but these are exceptional. On the other hand, the belief is growing that

many of the triliteral roots, especially some of the so-called weak roots, were originally biliteral. But here the tendency of the languages toward triliterality is seen plainly from the fact that to a large extent these roots have assumed the appearance of triliterality.

The relation between nouns and verbs is very close. In fact most of the features of inflection are the same in both, the noun being the earlier.

A prominent characteristic of verbal inflection, with many similarities in the nouns as well, is the development of many different stems or conjugations from the same root. These are formed partly by internal change in consonants and vowels and internal additions and partly by external additions. Thus one stem has an intensive meaning, another a causative, another a reflex, etc. In the original Semitic there must have been many different stems. Some have been lost in each language. The Ethiopic has preserved the largest number, next the Arabic, then the Assyrian. These stems afford a very concise way of expressing many different shades of meaning connected with a single root idea, each of which would in most languages require either a compound verb or the addition of separate words for its expression.

The languages use pronominal suffixes attached to nouns, verbs and prepositions. These are really shortened forms of the pronouns. With nouns they have the force of a genitive, with prepositions of a dative and with verbs ordinarily of an objective accusative.

The languages are distinctly objective. The personal standpoint of the speaker or writer counts for little. In the verb, the third person is the simple uninflected form, the starting point of the inflection, it is the first person in the Aryan languages. The present time, the time of the speaker or writer, is of little importance in comparison with the past and future. The use of the tenses is often based upon an assumed standpoint. So also many phases imply the assumption of a standpoint other than that of the writer or speaker.

Certain phenomena may be classed together under the general statement that they show a lack of development in the languages. This is not, however, due to lack of time or of favoring circumstances, because these features are ordinarily found to characterize in a similar way all the languages at all times and under all circumstances. These phenomena indicate rather psychological characteristics of the people, their natures are not complex, they show limitations in some directions. Certain developments which are common in Aryan languages the Semites did not feel to be necessary. Among these characteristics may be mentioned the following:

Most of the Semitic languages have only two tenses, usually called the perfect and the imperfect. Whether these differed in their fundamental meaning from some of the tenses of the Aryan languages is a question on which there is difference of opinion. The later forms of several of the languages developed a present tense from a participle, which is only suggested in the earlier usage. In general the Semitic tense usage is thus much less fully developed than the Aryan. Moods also are relatively undeveloped. They are found only in connection with the imperfect tense, even the impera-

tive being derived from it, and in most of the languages they are not widely used.

The nouns have only two genders, masculine and feminine.

There is an almost entire absence of compound words, both nouns and verbs, except in proper names.

The syntax is in many particulars of a simple and undeveloped kind. There is a strong tendency to leave much in the relation of clauses and sentences to inference. This leads to the very frequent use of parataxis. There is but a small number of particles of every kind. In most of the languages the original case endings have been lost, but there has been no great development of prepositions to take their place. There is also a scarcity of adjectives in most of the languages, so that nouns are often used in their stead.

Relation to the Primitive Language.—No existing language can be called the common mother of the other Semitic languages, nor even the most primitive in every respect. Each of the languages is probably in some features more primitive than any other. But the Arabic preserves far more that is primitive both in grammatical forms and syntactical usage than any other of the languages. This is in spite of the fact that the known Arabic literature is very late. The Arabs in their desert home remote from other nations changed the language less than other peoples in a short space of time. Thus the Arabic preserves the case endings, which have been largely lost in the other Semitic languages, except in the Assyro-Babylonian where they are often used indiscriminately. The Arabic preserves the original endings, sometimes consonants, more often vowels, both in verbs and nouns, which are largely lost elsewhere. The Arabic retains in most cases the original vowels, which in the other languages undergo various changes, such as heightening, shortening (volatilization) and contraction, although the Ethiopic has also retained many of these. The formation of the plural nouns by internal changes, the broken plurals, which is so prominent a feature of the Arabic, is only found elsewhere in Ethiopic. This was probably a primitive feature.

GEORGE RICKER BERRY,
Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

SEMITIC NATIONS, those nations whose languages were Semitic, and which are consequently supposed to have been racially connected. It is recognized, of course, that language is not an infallible evidence of race, and that the conclusions on that point drawn from it have at least a small degree of uncertainty. But in the absence of much evidence of any other kind, the data supplied from this source must be used as a working basis. (See SEMITIC LANGUAGES). In considering the Semitic nations as a group, the first question is, of course, concerning their primitive home. Primitive is here used only in a relative sense, for the very earliest history of these nations goes back to a time concerning which, in the present state of knowledge, there is no positive information or plausible inference. The consideration of that time would involve a discussion of the origin of the whole human race, which is a question too broad to be entered upon here. By primitive home is meant, therefore, the location of the Semites when they were one people, the common distributing point of the Semitic nations. While entire certainty on this point is not attainable, yet there are some indications which may be followed.

Some have found this primitive home in Babylonia or its vicinity. For this the chief argument is based upon language. A consideration of the words common to all the Semitic languages is thought to point to the conditions prevailing in Babylonia, or in some adjacent country from which Babylonia was the first stopping place of the undivided race. But this argument from language is inconclusive, in view of the possibility of the disappearance from a language of words once common, and also of the borrowing by one Semitic language from another. The fact that the known history of Babylonia extends back to a point much earlier than that of any other Semitic nation has very little to do with the question.

There are many arguments in favor of Arabia, that is, central and northern Arabia, as the primitive home. Arabia is a country which is largely desert, except in the southern part. Such a country, it is said, best explains the racial characteristics. These characteristics, as usually given, are intensity of faith, ferocity, exclusiveness and imagination. It is also said that the Arabs have preserved the Semitic character and characteristics in their purest form. Certainly those characteristics which have just been mentioned are found combined among the Arabs more fully than elsewhere. A desert origin seems, also, to explain most satisfactorily some features of the Semitic languages. This is true especially of the great predominance of gutturals. Such a development of these as was found in primitive Semitic demands good physical powers, which would come from an outdoor life in a pure atmosphere, and plenty of leisure for conversation. These conditions are met in Arabia. In this connection it is important to note that the Arabs have preserved the gutturals more fully than any other Semitic nation, the others having considerably modified their primitive habits of life. Again, it is by some regarded as a universal law that nomads may adopt settled habits of life, but that the reverse process does not take place. This rule perhaps is not invariable, yet it does represent the usual tendency. When,

therefore, we find some Semitic nations nomadic and others not, it follows that the nomadic form of life is probably the earlier. For this nomadic form of life the natural location is Arabia. Further, the close resemblance of the Semitic languages to one another, much closer than in any other known group of languages, indicates some of the early conditions surrounding the nation. It suggests that the primitive nation lived in a comparatively limited space for a long period of time before being divided, giving opportunity for much common development of the language and also that it was largely isolated from other nations who would influence the language. Such a country of moderate size, in comparative isolation from other countries, is Arabia alone in the region inhabited by Semitic peoples, or in their vicinity.

Another view is that the primitive home was in Africa. According to this view, however, as ordinarily held, the Semites very early migrated into Arabia and there lived for a long period of time before any division took place. This view would, therefore, make Arabia the centre of distribution for the Semitic nations. Hence the arguments already adduced in favor of Arabia would still be valid upon this view, but additional arguments are presented in favor of going back one step further to an African home. In support of this view the chief argument is that there is supposed to be a racial connection between the Semitic and Hamitic peoples. By Hamitic peoples are not meant the negroes, but the Egyptians, Berbers, etc., although it is by no means certain that the Egyptians are Hamitic. For this racial connection there are two chief arguments. One is from resemblance in physical characteristics, concerning which, however, the evidence is inconclusive. The other is from resemblance of the languages and is of greater force. The general resemblance between the Hamitic and Semitic groups of languages are the following: the pronouns are similar; the verbs have similar tenses and formation of stems; it is claimed by some that the Hamitic roots, like the Semitic, were originally trilateral; the ending for feminine gender is the same, *t*; several of the numerals are very similar; both groups form nouns by means of a prefixed *m*; both write without expressing the vowels; and 50 or more words of ancient Egyptian are said to be identical with Semitic words. The possibility of accounting for these resemblances by borrowing from the Semitic languages by the Hamitic does not seem, however, to be entirely excluded. Of course, not all of the resemblances are such as are most liable to be borrowed, but any of them might be. The possibility of such borrowing is increased, too, by other considerations. For the Egyptian resembles the Semitic languages more than any other Hamitic language. And it has been thought, on other grounds, that Egypt has been subject to Semitic influences in early times. Some have believed, for example, that certain features in early Egyptian civilization were taken from the Babylonians. Others have thought that Arab invaders came into Egypt in early times. Such a relationship as is claimed between the Semitic and Hamitic races can not be said, therefore, to be yet established. And even if there were such a relationship, no sufficient reason appears for thinking that the

primitive race must have had its home in Africa rather than in Arabia.

The conclusion that the earliest known home of the Semites was in Arabia may be said, therefore, to be reasonably well established. The arguments which are thought to show a previous residence in Africa are inconclusive. That view can only be regarded, in the present state of knowledge, as a conjecture with very little evidence to support it.

Separation into Nations.—Concerning the precise, or even approximate, date of the separation of each nation from the parent stock nothing is known. The recorded history of every Semitic nation begins long after that time. Even the order of departure of the different nations is not certain. Here, however, the languages themselves come in to supplement our direct knowledge. On account of the resemblances of the languages to each other, the order of separation is often stated thus. All the other groups departed from the southern, that is, migrated from Arabia, and settled in Babylonia and its vicinity. After dwelling here together for a long time, the Arameans first separated, then the Canaanites, and finally the Assyrians. There was also emigration southward, giving the southern Arabs, a branch of whom ultimately migrated to Abyssinia. It is doubtful, however, whether this outline is correct in all details. It assumes that the Canaanites are more closely related to the Babylonians than are the Arameans, while in reference to some features of the languages the reverse is true. It also presents difficulties in accounting for the Arameans from the time of such separation until their appearance in history. For while some had settled in upper Mesopotamia at an early time, yet the Assyrian inscriptions indicate that fresh streams of migration were coming into upper Mesopotamia, and into Babylonia and Assyria, for a considerable period of time before and after 1000 B.C., apparently from Arabia. It seems probable then, that at the first general separation between north and south, the ancestors of the northern nations went not to Babylonia, but to northern Arabia. After a considerable sojourn there, the Babylonians continued their journey to Babylonia, and part or all of the Canaanites, after a time, went on to Canaan, while the Arameans remained in northern Arabia, from which region successive waves of migration swept over Mesopotamia, Syria and their vicinity. The nomadic habit of life of many of the Arameans, which seems to be indicated in the Assyrian accounts, also points to such a residence in Arabia as is here indicated. Contact after the original division doubtless had much influence on language. The Arameans were probably thus influenced by the Arabs and by the Babylonians. The Babylonians themselves were also influenced by the Arabs with whom they had commercial intercourse in early times. Further, the Canaanites were without doubt influenced by the early intercourse between Babylonia and the region of Palestine.

The Individual Nations.—The earliest Semitic nation of which we have any history was in Babylonian. Their own records, which begin perhaps about 3000 B.C., give the first information concerning them. The earliest inscriptions show them already in Babylonia, but there are indications, as usually understood, of early con-

flicts with the original Sumerian inhabitants in southern Babylonia. Ultimately, however, the Sumerians became subject to the Babylonians and were gradually incorporated by them. In course of time the people of Babylonia became a mixture of various elements, Semitic and non-Semitic. The non-Semitic Elamites and Kassites had dominion over the land at various times, and must have contributed materially to the population. In the course of their history also it is probable that many Arabs and Arameans were incorporated into the population. The Babylonians remained a distinct people until their conquest by the Persians under Cyrus in 538 B.C., after which time they never again became independent, and doubtless were mingled with the Persians and others with whom they associated. The Babylonians were never nomads in historical times, but dwelt largely in cities. In all early history and to about 2000 B.C., the government was one of cities, with no power actually supreme. The Babylonians were not unwarlike, but were especially devoted to religion, commerce, science and education. Assyria was doubtless settled by colonists from Babylonia somewhat before 2000 B.C., and was at first subject to Babylonia. From about 1500 B.C., however, the nation was independent, and for most of the period from 745-606 B.C. held Babylonia in subjection, as well as at times before 745. Their national history ended with the capture of Nineveh by the Medes in 606 B.C. The Assyrians were much more warlike than the Babylonians, and considerably given to commerce, but cared much less than the Babylonians for religion, science and education.

The Arameans were not one nation, but rather many tribes. They came in waves of migration from Arabia to the frontier of Babylonia, and to upper Mesopotamia and finally reached the country later called Syria. In the Old Testament, Arameans are alluded to in connection with Abraham and his descendants, especially Jacob. The earliest mention of the Arameans elsewhere is probably in the Tell el-Amarna letters in the early part of the 14th century B.C. The Assyrian kings also speak of them from time to time in their inscriptions, beginning in the 14th century. From all indications it would seem that their earliest settlement of importance was in the upper Mesopotamia, between the rivers Euphrates and Khabur. This settlement was reinforced by fresh arrivals from time to time. Just when they passed over the Euphrates and occupied Syria is uncertain, but the indications suggest that somewhat before 1000 B.C. they had obtained possession of most of the country, especially the northern and middle portions, defeating and driving northward the Hittites who had previously possessed the country. About the same time they began to come in large numbers into the territory of Assyria and Babylonia, especially along the Euphrates. In the times of Tiglathpileser III and later, 745 B.C. and afterward, they also had settlements along the lower Tigris. In the earliest notices of them they were largely nomadic, but they soon turned to settled habits of life. In their government there was little unity; each political division consisted of a strong city and the people inhabiting a greater or less amount of ter-

ritory around the city. Several of these city states would unite for a campaign, but these leagues never lasted long. The Old Testament speaks of the Arameans in connection with several cities, namely, Damascus, Zobah, Maakah and Beth Rehob. Other prominent cities of the Arameans were Hamath in Syria and Haran in Mesopotamia. Upper Mesopotamia is spoken of in the Old Testament as a region by the names Aram Naharayim and Paddan Aram. The most powerful of the Arameans were included in the kingdom of Damascus, but their power was broken when Damascus was captured by Tiglathpileser IV about 732 B.C. After this time the population of Syria and upper Mesopotamia no doubt continued to be largely Aramean for centuries, although the people did not form a nation, and had little political power. Of the many who used the various Aramean languages and dialects after this time (see SEMITIC LANGUAGES), it is probable that a large part were Arameans. But naturally many others were mingled with them, so that in their latter history the Aramaic-speaking people represented a mixture. The language was also adopted by those who were not Arameans, as, for example, by the Jews. Some who have left inscriptions in the language were not Arameans, but Jews and Arabs. The Arameans were a people of considerable warlike ability, although with little taste for political organization, and were much given to commercial pursuits.

All the Canaanite Semitic nations aside from the Hebrews, namely, Canaan, Ammon, Edom, Moab and Phoenicia, were occupying their respective countries before the arrival of the Hebrews from Egypt, how long before is not known with certainty. The Phoenicians are mentioned in Egyptian records as early as the 16th century and are prominent in the Tell el-Amarna letters. The Phoenicians were distinguished beyond any other Semitic nation as a commercial people, especially on the sea, and were great colonizers. Their form of government was the city state, Tyre and Sidon being the two most prominent cities. Whether the Hebrews were actually Canaanites or were a branch of the Arameans is uncertain, the indications for the latter view coming entirely from the Old Testament. If this view be correct, the Hebrews spoke Aramaic on their arrival in Canaan, and learned the Canaanite language from the people there. The other view is, however, rather more probable, according to which the Hebrews were themselves a branch of the Canaanites, although traditionally associated with the Arameans in the experience of Abraham, the founder of the nation, and his immediate descendants. The earliest statements concerning Abraham in the Old Testament connect him with the city Ur in Babylonia. Both the Old and New Testaments originated among the Hebrews. The Hebrews were not particularly distinguished as warriors, and in ancient times had no inclination toward commercial pursuits.

If the earlier conclusions concerning Arabia as the distributing point of the Semites are true it is evident that after the departure of the nations hitherto mentioned the Arabs remained by themselves in central and northern Arabia at a period long before we have any record of

them. There are no indications in the early history that the Arabs had a centralized government. Rather it would seem that, being nomadic, they were early separated into many different tribes, having no political unity. They are mentioned quite often by the Assyrian kings who fought against them, beginning with Shalmaneser III in 854 B.C. Their chief military activity came during and after the time of Mohammed.

Of the time of migration into southern Arabia there is no definite information. Southern Arabia is of a different character from the rest of the land, being fertile and adapted to agriculture. The immigrants here naturally abandoned the nomadic habit of life. The knowledge of these south Arabian kingdoms comes chiefly from their own inscriptions, whose date is by no means certain. It is now thought, however, by those who have given special attention to the matter that the earliest south Arabian kingdom was the Minæan, extending from about 1250–600 B.C., at the latter date being conquered by the Sabæans, while the Sabæan kingdom lasted from about 750–100 B.C. Both were evidently kingdoms of considerable power. Probably about 350 A.D. some Sabæans migrated to Abyssinia, and there founded the kingdom of Aksum, where the language called Ethiopic was spoken.

Characteristics of the Semitic Peoples.—It is evident that the Semites as a whole were decidedly religious. But it is now evident that there was no Semitic tendency to monotheism, as was formerly supposed. The three great monotheistic religions of the world, to be sure, Judaism, Christianity and Mohammedanism, have come from the Semites. But Mohammedanism was strongly influenced by Judaism, and Judaism and Christianity owe more of this teaching to the work of great individuals than to any natural tendency of the Hebrews. The Hebrews had, in fact, a tendency to polytheism, as is shown by their history in the Old Testament. The Arabs were polytheists before the time of Mohammed. All the other Semitic nations, so far as we know, were polytheistic.

In considering other characteristics and achievements of the Semites, especially in comparison with the Aryans, it needs to be remembered that the prominence of the Semitic nations precedes that of the Aryans. Hence the Aryans have been able to profit by whatever was good in the Semitic achievements. Considered in the light of their own times, the Semites were not deficient in those traits which have distinguished the Aryans. Usually, however, not more than two or three Semitic nations have manifested conspicuously any one of such traits. In warfare the Arabs, under Mohammed and his successors, the Assyrians and the Babylonians achieved signal success. The Assyrians, for their own time, were great organizers of conquered territory. The scientific attainments of the Babylonians were such that nearly all nations of antiquity learned many things from them, such as astronomy and mathematics. The Assyrians and Babylonians showed much artistic ability. Much of the literature of the Semitic nations is imaginative, especially the poetry and mythology.

Robertson, 'Lectures on the Religion of the Semites' (2d ed., London 1907); Wright, William, 'Lectures on the Comparative Grammar of the Semitic Languages' (Cambridge 1890).

GEORGE RICKER BERRY,
Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

SEMLIN, Charles Augustus, Canadian statesman: b. Ontario, 1836. He went to British Columbia in 1862, spent some years in the Cariboo district and finally settled at Cache Creek. He was largely interested in agriculture and in the meat industry. He served many years in the assembly of British Columbia and was Premier in 1898–1900. He was afterward Commissioner of Lands and Works, Provincial Secretary and Minister of Education.

SEMMERING, zēm'ēr-ing, Austria, an Alpine pass on the borders of Styria and Lower Austria, 44 miles southwest by west of Vienna. The road over the Semmering Pass (2,940 feet) is of ancient date and here between 1848 and 1853 was built the famous Semmering Railway, the first of the European mountain railways. The railway begins at Gloggnitz and is carried along the face of precipices by means of 15 tunnels and 16 viaducts to Mürzzuschlag. The scenery along this portion of the line is of the grandest and most picturesque description. At its highest elevation, 2,891 feet, the line pierces the Semmering in a tunnel 4,667 feet long. Its entire length is 25 miles and it was constructed for the Austrian government at a cost of about \$7,000,000.

SEMMES, sēmz, Raphael, American naval officer: b. Charles County, Md., 27 Sept. 1809; d. Mobile, Ala., 30 Aug. 1877. He became a midshipman in the United States navy in 1826, a lieutenant in 1837, was volunteer aide to General Worth in the Mexican War and secretary to the lighthouse board in 1859–61. Upon the secession of Alabama he resigned his commission and was assigned to the command of the steamer *Sumter*, the first vessel of the Confederate navy. With this ship he cruised with success against Northern commerce in the West Indies. He then had the swift steamer *Alabama*, or No. 290, built in England, and in September 1862 started on his well-known voyage. He flew British colors when approaching his prey, hoisting the Confederate ensign when sure of his prize. His seamen were chiefly English. After a destructive career, during which he captured 64 vessels and burned all but seven, his ship was sunk off Cherbourg Harbor, France, by the Federal steamer *Kearsarge*. Subsequent to the war he practised law. His writings include 'Afloat and Ashore During

the Mexican War' (1851); 'The Cruise of the Alabama' (1864); 'Campaign of General Scott in the Valley of Mexico' (1852); 'Memoirs of Service Afloat During the War Between States' (1869).

SEMNOPIITHECUS, a genus of Asiatic monkeys, the langurs, including species possessing an elongated tail, cheek pouches and ischial callosities. All of this genus are inhabitants of Asia and Asiatic islands. The sacred entellus monkey is a familiar example. See **LANGUR**.

SEMOLINA, hard grains of wheat left in the bolting cloth when the fine flour has been passed through its meshes and some times manufactured by millers. Certain hard, large-grained wheats growing in southern Europe produce the best semolina, which is used for thickening soups, for macaroni, for a French bread, as an addition to the Italian polenta and is employed in puddings, especially in England.

SEMPACH, zēm'pāh, Switzerland, in the canton of Luzerne, lies eight miles northwest of the town of Luzerne, on the lake of the same name. It is a walled town and its chief interest consists in its having been one of the outposts of the Swiss in their conflict with Austria. The battle of 9 July 1386, in which the Austrians under Duke Leopold received a crushing defeat at the hands of the confederated Swiss, was fought under its walls—a victory the more remarkable as won against extraordinary odds, and in which the famous Winkelried was the hero; the duke with 600 knights were left upon the battlefield. The anniversary of this victory is always celebrated on this spot by prayers and thanksgiving. Pop. 1,200.

SEMPER, zēm'pēr, Gottfried, German architect: b. Hamburg, 29 Nov. 1803; d. Rome, 15 May 1879. He attended the Johanneum of his native town and studied law in the University of Göttingen, but changed to the profession of art, having been attracted to the study of architecture under Gau. He then took a journey through Italy, Sicily and Greece. On his return he published 'Bemerkungen über bemalte Architektur und Plastik bei Alten' (1834), and the essays 'Die Anwendung der Farben in der Architektur und Plastik' and 'Dorisch-Griechische Kunst in 6 Tafeln mit Farben' (1836). He became the pupil of Schinkel in Berlin, who ungrudgingly recognized his talent and educated him to fill the place of professor of architecture in the Dresden School of Building. Between 1837-41 he built several important structures in Dresden, including the Court Theatre, and in 1849 traveled to Paris and London, in which latter city he undertook, among other things, the arrangement of the statuary in Kensington Museum. He was active up to the time of his death in Dresden, Vienna and other places, where his work is still a commanding feature of city architecture. He was an uncompromising adherent of the Renaissance style, as far as this was founded on the Roman of the later empire, especially as exhibited in the composition of the forums. His buildings are distinguished for harmony of composition together with purity and moderation of detail. Among his many works on architecture may be noted 'Über Poly chromie und ihren Ursprung' (1851); 'Wissenschaft, Industrie, und Kunst'

(1852), and 'Der Stil in den technischen und techtonischen Künsten' (1860-63). Consult Lipsius, 'Gottfried Semper in seiner Bedeutung als Architekt' (1880).

SEMPER, Karl, German naturalist: b. Altona, Germany, 6 July 1832; d. Würzburg, Bavaria, 29 May 1893. He was educated at Kiel, Hanover and Würzburg, traveled extensively in Europe and was engaged in a tour of the Philippines, China, Japan and the South Sea Islands in 1858-66. On his return he was appointed to the chair of zoology at Würzburg which he occupied until his death. He delivered a course of lectures before Lowell Institute of Boston in 1877, afterward published under the title 'Animal Life as Affected by the Natural Conditions of Existence' (1881). He edited nine volumes of 'Arbeiten aus dem Zoologischen Institut' in Würzburg, and also wrote 'Reisen im Archipel der Philippinen' (1867-72); 'Die Palau Inseln im stillen Ozean' (1873); 'Die natürlichen Existenzbedingung der Thiere' (1880), etc.

SEMPILL, Robert, Scottish ballad writer: b. about 1530; d. 1595. He was probably a cadet of the house of Sempill, of illegitimate birth; received an excellent education; spent part of his early life in Paris, and upon his return to Scotland went into military service. He ardently supported the Reformation in Scotland in his writings and severely attacked the Catholic cause. The majority of his poems have been preserved in the original, the most noteworthy of them being 'Ane Complaint upon Fortoun' (1581); 'The Legend of the Bishop of Saint Androi's Lyfe' (1584), and the 'Sege of the Castel of Edinburgh.' Two complete editions of his writings were published, 'The Sempill Ballates,' edited by T. G. Stevenson (Edinburgh 1872), and 'Satirical Poems of the Time of the Reformation' (edited for the Scottish Text Society by James Cranstoun, 2 vols., Edinburgh 1889-93). The last two poems were included in the 'Scottish Poems of the Sixteenth Century' (edited by Sir John Graham Dolyel, 2 vols., Edinburgh 1801).

SEMPLE, Ellen Churchill, American anthropogeographer: b. Louisville, Ky., 1863. She was graduated at Vassar College in 1882 and in 1891-92 and 1895 studied at the University of Leipzig. She has specialized in the study of the effect of geography on the development of races and on national life. She is a contributor to the *Bulletin* of the American Geographical Society, the *New York Journal of Geography* and to the *London Geographical Journal*. She was awarded the gold medal of the American Geographical Society in 1914. Author of 'American History and Its Geographic Conditions' (1903); 'Influence of Geographic Environment' (1911).

SEMPRINGHAM, Order of. See **ORDERS**, RELIGIOUS.

SEN, Keshub Chunder, an Indian religious reformer: b. village of Garifa (Gouripore), Bengal, 19 Nov. 1838; d. 8 Jan. 1884. His education was partly Hindu and partly English. He became attracted in 1858 to the Brahmo-Somaj, the Theistic Church of India, so much so that he soon began a campaign of religious reform for the regeneration of his fellow-countrymen. In 1865 a split in this Church oc-

curred, resulting in the formation of one body under the leadership of Sen and assuming the name of "Brahmo-Somaj of India." After a visit to England in 1870 he put into effect, and with beneficent results, some philanthropic schemes based on the principles of those he had seen there. In 1878 dissensions arose among his followers owing to his frequent displays of ill temper and to his leaning toward mysticism, and the congregation split. The last few years of his life were full of controversy, disappointment and sorrow. He wrote 'Yoga, Objective and Subjective' (1884). Consult Müller, Max, 'Biographical Essays' (1884).

SENAC, Jean Baptiste, an eminent French physician: b. in the diocese of Lombec, Gascony, about 1693; d. 1770. He was graduated in physics at Rheims and later at Paris and in 1752 was appointed physician to Louis XV. He was a member of the Royal Academy of Sciences at Paris and of the Royal Society of Nancy. His greatest work and to which he owes his anatomical reputation was 'Traite de la Structure du Cœur, de son Action, et de ses Maladies' (2 vols., Paris 1749). He also published an edition of 'Heister's Anatomy' (Paris 1724); 'Discours sur la Méthode de Franco, et sur celle de M. Rau touchant l'Operation de la Taille' (1727); 'Traite des Causes, des Accidens, et de la Cure de la Peste' (1744), and 'Lettres sur la Choix des Saignées' (1730), written under the pseudonym of Julien Morison.

SÉNACOUR, Etienne Pivert de, French philosophic writer: b. Paris, November 1770; d. Saint Cloud, February 1846. He was of a melancholy and seclusive nature even as a boy, and read eagerly everything obtainable, especially such books as related to travel. For four years he studied philosophy at the Collège de la Marche and was then sent to the Seminary of Saint Sulpice by his father's orders, but escaped from there and went to Lake Geneva. In 1798 he returned to Paris and devoted himself to literature, though the main source of his meagre income was a pension obtained from Louis Philippe through the good offices of M. Villenain. His chief works are 'Réveries sur la Nature primitive de l'homme' (Reveries of the Primitive Nature of Man) (1799); 'Obermann' (1804); 'Libres Méditations d'un Solitaire Inconnu' (Free Meditations of a Recluse) (1819). Of these 'Obermann,' a collection of letters from Switzerland treating on nature and the human soul, is by far the best known, and while a doubt bordering on atheism is expressed in its lines, yet the work is entirely original and contains many beautiful passages showing a delicate and charming feeling for nature.

SENATE, United States. The Constitution of the United States provides that "all legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six years, and each Senator shall have one vote." It was further provided that the senators chosen at the first election should be divided into three classes, the seats of senators of the first class to become vacant at the end of two years; of senators of the second class at the end of four

years and senators of the third class at the end of six years, thus providing that one-third should be chosen every second year, and it is further provided that, "if vacancies happen by resignation, or otherwise, during the recess of the Legislature of any State, the executive thereof may make temporary appointments until the next meeting of the Legislature, which shall then fill such vacancies."

Regarding the qualifications of senators the Constitution provides that "no person shall be a Senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and who shall, when elected, be an inhabitant of that State for which he shall be chosen."

The Vice-President of the United States is president of the Senate, but has no vote unless the Senate is equally divided. The Senate is authorized to choose other officers, and also a president pro tempore, in the absence of the Vice-President, or when he shall exercise the office of President of the United States. The Senate has the sole power to try impeachments, and when sitting for that purpose its members must be under oath or affirmation. When the President of the United States is tried, the chief justice of the Supreme Court of the United States presides, and the concurrence of two-thirds of the members present is requisite to convict. Judgment in cases of impeachment cannot extend further than to removal from office and disqualification to hold and enjoy any office of trust or profit under the United States. The legislatures of the respective States are empowered to fix the time, place and manner of electing senators, but Congress may make or alter such regulations, except as to the places of choosing senators. The members of the Senate, like those of the House of Representatives, are in all cases, except treason, felony and breach of the peace, privileged from arrest during their attendance on the sessions of the Senate and in going to and returning from the same, and they are exempt from being held responsible elsewhere for anything said in debate in the Senate. No person holding any other office under the United States can be a senator, and no senator can be appointed to office, the emoluments of which have been increased during his term of service in the Senate. These restrictions apply also to members of the House of Representatives. The Senate may propose or concur in amendments to revenue bills, but cannot originate them, that power resting in the House.

The Senate received its existing form as a recognition of the equality of the several States and had not this concession to State's rights been granted by the convention which framed the Constitution the minor States would probably not have accepted that instrument.

The proceedings of the Senate were held in secret until the session of 1793, when discussions as to Albert Gallatin's right to a seat therein were held with open doors. This publicity had been urged from the beginning by those who argued that secret debates diminished the responsibility of the Senate and of its individual members to the people, and that publicity would inspire popular confidence in the Senate and its course. A resolution was passed that after the termination of the session then being held and as soon as suitable galleries

should be provided, the galleries, except on special occasions requiring secrecy, should remain open while the Senate was engaged in legislative business. Executive business is still disposed of in secret session.

The question of electing United States senators by direct vote of the people, instead of by the legislatures of the several States, has been agitated for many years. For this purpose an amendment to the National Constitution is necessary. In 1903 the legislatures of the several States passed resolutions asking Congress to call a convention for the purpose of considering an amendment to the Constitution providing for such election of United States senators. Resolutions to the same effect were presented in other legislatures, and finally in 1913 the matter culminated in the adoption of the Seventeenth Amendment to the Constitution which specifies "The Senate of the United States shall be composed of two Senators from each State, elected by the people thereof for six years; and each Senator shall have one vote. The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislatures."

Next to President of the United States, and hardly excepting the Vice-Presidency, the office of senator is more sought than any other under the national or State governments. In the earlier period of the government, when the States still regarded themselves as almost independent sovereignties, the governorship of a State was looked up to as an office but little short of the Presidency. In the more recent years of the republic governors have often been eager aspirants for the senatorial office, and very willing to give up their places as chief magistrates of their respective States to sit in the so-called Upper House at Washington. Many of America's great statesmen have been members of the Senate, and no body of modern legislators has more august traditions or associations. Some of the States make it a rule to re-elect the same senators practically for life, and this is especially the case with the New England States and in certain Southern States. Senators are extremely jealous of their liberty of debate, and their prerogatives. The salary of senators is \$7,500 per annum. The present full membership of the Senate is 96, but several seats are usually vacant through disputed elections or for other reasons.

SENATORIAL COURTESY, a custom in the United States Senate by which the procedure of that body is based on personal honor rather than on a code of rules. For instance, the Senate along this line of courtesy will not confirm a Presidential appointee in a State whose senators object to the person nominated.

SENATORIAL DISTRICT. See DISTRICT.

SENDAI, sĕn-dî', Japan, capital of the province Ken Mijagi, on the island Hondo, near the eastern coast, 190 miles northeast of Tokio. It is celebrated for its silk and lacquer manufactures, and carries on a considerable trade in fish and salt. It is on the railway running north from the capital.

SENEBIER, Jean, Swiss natural philosopher and historian: b. Geneva, 1742; d. 1809. After studying theology he was ordained a minister about 1762 and for several years

preached at Chancy. Philosophy and natural history, however, held more charm for him than divinity and in 1773 he left the ministry to become keeper of the public library at Geneva. In 1787 he also became one of the conductors of the *Journal* of Geneva. His most important works are 'Essai sur l'Art d'observer et de faire des Experiences' (2 vols., 1775); 'Mémoires Physico Chimiques sur l'Influence de la Lumière Solaire sur les Trois Règnes de la Nature'; 'Rapports de l'Air avec les Etres organisés'; 'Histoire Littéraire de Genève' (3 vols., 1808); besides which he also published 'Catalogue des Manuscrits dans la Bibliothèque de la Ville de Genève.'

SENECA, Lucius Annæus, Roman philosopher, son of the rhetorician of the same name: b. Corduba (Cordova), Spain, about 4 B.C.; died in Rome by his own hand at the order of Nero, 65 A.D. As his family was wealthy and of equestrian rank, the boy was brought to Rome to be educated for the bar and an official career. He attended also with enthusiasm the lectures of several noted Pythagorean, Stoic and Cynic philosophers. He had gained great fame for eloquence and had entered the Senate through the quaestorship, when, in 41, at the instance of Messalina, who accused him of an intrigue with Julia Livilla, sister of the late Emperor Caligula, he was banished to Corsica. From there he sent to his mother, Helvia, the charming 'Consolatio,' but exhibited little fortitude in his exile. Finally, in 49, Agrippina, who, after the execution of Messalina, had married Claudius, and had prevailed upon him to make her son Nero the heir to the throne, secured Seneca's recall that he might act as tutor to the young prince, then 11 years of age. At Nero's accession in 54, he wrote the curious political satire (still extant) on the death of Caludius, commonly known as *Apocolocyntosis*, "Pumpkinification," a word formed upon the analogy of *apotheosis* "deification." During the first years of the new reign, Seneca, in conjunction with Burrus, prefect of the Prætorian guard, was, on the whole, successful in keeping Nero within the bounds of humanity. Agrippina, ambitious and cruel, was determined to rule the state through her son, and Seneca seems to have palliated the latter's excesses in order to destroy his mother's influence over him. Finally, when Poppæa Sabina, with whom Nero had become infatuated, induced him to order the assassination of his mother, Seneca wrote for the emperor a letter to the Senate, asserting that Agrippina had conspired against his life, and had committed suicide upon being discovered. The death of Burrus in 62 made Seneca's position quite insecure. Nero fell into the hands of men like the infamous Tigellinus; money was needed to meet his extravagant expenditures and Seneca had become enormously wealthy. Foreseeing his probable ruin, he offered to resign to Nero all that he had, and, upon receiving a declination, couched in terms of specious affection, retired into the country and lived with utmost simplicity. In 65 he was implicated in the conspiracy of Piso and was ordered to commit suicide. With his wife, Paulina, who insisted on dying with him (see the affecting account in Tacitus, 'Annals,' XV, 60-64), he opened the veins of his arms. Paulina's life was barely saved by her slaves; Seneca, after suffering prolonged

agony, during which he displayed the utmost serenity, was finally suffocated in a vapor bath.

"Nothing in life became him like the leaving it." He was undoubtedly an earnest seeker after truth and right. The Roman world was much his debtor for the wise and humane administration of the state during the "golden quinquennium" of Nero; but he lacked real strength of character, and in his connection with Nero too often acquiesced in the doing of positive evil that a greater good might be accomplished. As a man of letters, he is incomparably the most brilliant figure of his time. He was an extremely prolific writer, his subjects are exceedingly varied, the ideas usually nobly conceived and eloquently expressed. In striking contrast to the periodic style of Cicero, he loves short, epigrammatic sentences. He is an expert in the use of every variety of rhetorical ornamentation, which, in harmony with the prevailing taste, he carries to excess. Though by no means a profound thinker, he is broad-minded and sympathetic in his presentation of the ethical principles, Stoic in the main, by which man's daily life should be guided. He was, indeed, by certain Fathers of the Church believed to have been a Christian, and there are still extant 14 letters, undoubtedly spurious, of a correspondence with Saint Paul. His moral essays embrace 12 so-called dialogues, 'On Peace of Mind,' 'On Anger,' 'On the Shortness of Life,' etc.; 3 books 'On Clemency,' addressed to Nero; 7 'On Benefits,' and 20 books of 'Letters to Lucilius.' With these may be grouped the seven books of 'Naturales Quaestiones,' which handle physics as a basis for ethical reflections. We possess also nine tragedies, composed rather to be read aloud than to be acted, and so rhetorical in substance that, though fine passages are not lacking, they are rather declamations than real poetry. They had, however, a great influence upon the drama of the 16th century.

Bibliography.—The best text of the prose works is by F. Haase, in the Teubner series (1893-95); of the tragedies, by F. Leo (Berlin 1878-79.) The 'Apocolocyntosis' has been edited by A. P. Ball (New York 1902). Consult also Merivale's 'History of the Romans under the Empire' (cc. 50, 52-24); Zeller's 'Eclectics' (London 1883); Farrar's 'Seekers after God' (London 1886).

NELSON G. MCCREA,
Professor of Latin, Columbia University.

SENECA INDIANS, Mohegan "Sinné-kens," "place of the stones," a tribe belonging to the Iroquois family. Their own name is *Tsonondowanenaka*, or *Tsonondowaka*, "people of the great hill or mountain," probably referring to the lofty eminence south of Canandaigua Lake. The term Seneca is a Mohawk rendering of this latter name, which has passed through Dutch to English hands. A member of the famous League of the Iroquois, founded about the year 1570. With the Mohawks and the Onondagas, the Senecas constituted the elder phratry of tribes in the social and political organization of the confederation, while the junior phratry was composed of the Oneidas and the Cayugas. The earliest known council fire of the Seneca people was established south of Lake Canandaigua, while their territory comprised the region environing Seneca and Canan-

daigua lakes and extended westward to Genesee River. As a member of the League, the Senecas were called *Honěnninhohonte*, signifying, "They are fixed to a door or door-flap," denotive of the fact that the Seneca people were the political doorkeepers of the League, not because, as commonly asserted they stood at the western frontier of the territory of the confederation, but because being at first averse to joining the League, they were finally persuaded to do so by having the honor of the office of doorkeeper and of official executioner bestowed upon them. Their last two League chiefs or rulers were charged with the duty of ascertaining the good or evil designs of any alien who might seek to enter the jurisdiction of the confederation. In the American Revolution the Senecas espoused the cause of Great Britain against the colonies. Today the Senecas are represented by several different bodies of people dwelling in diverse places and under various forms of government. About 553 are on the Tonawanda reservation, 1,262 on the Cattaraugus reservation, 1,006 on the Allegany reservation, 10 on the Tuscarora reservation, and 6 on the Onondaga reservation, all in New York State; 87 are on the Cornplanter reservation in Pennsylvania; and 219 on the Grand River reservation in Ontario, Canada; total, 3,143. In addition there are 337 so-called "Senecas" in the Indian Territory, but these are not included with the foregoing, as it is doubtful whether they were ever true Senecas. The earliest estimate of the numbers of the Senecas, in 1660 and 1677, give them about 5,000. In 1825 those in New York were reported at 2,325. Morgan, 25 years later, estimated them at 2,712 with over 200 more on the Grand River reservation in Canada. About the same estimation was given in 1909. Skaniadario, or Handsome Lake, the founder of the reformed pagan Iroquoian religion in vogue to-day among the various northern Iroquoian peoples, was a Seneca. On the migration, or probably expulsion, of the Awenrehronon from the headwaters of Genesee River, New York, in 1639, and on the later defeat of the Neutral Nation, about 1649-50, and of the Eries about 1654-57, the Senecas moved some of their settlements and colonies westward toward Lake Erie and along the Allegheny River. In 1657 there were 11 different alien tribes or peoples represented among the Senecas, thus indicating how well they exercised the right of adoption to replace their great losses in the almost interminable wars of the League, which had then lasted about 75 years. Of the several tribes formerly constituting the League of the Iroquois, the Senecas are the most progressive in the arts and knowledge of civilization. With incidental exceptions, the history of the Senecas previous to the American Revolution is virtually that of the League. See IROQUOIS.

SENECA LAKE, a lake west of the central part of New York State, about 25 miles south of Lake Ontario (q.v.), into which it discharges its waters by the Seneca and Oswego rivers. It is about 37 miles long, from north to south; and from one to four miles wide. Its depth is about 630 feet and it is 445 feet above sea-level. It is one of the group called the "Finger Lakes."

SENECA RIVER, a river of New York; flows east from the north end of Seneca Lake to the north end of Lake Cayuga, then turns north and is joined on the left by the outlet of Lake Canandaigua, then turns east, and receives in succession the drainage of the other parallel "finger lakes," Owasco, Skaneateles and Onondaga, then turns northwest, taking the name of Oswego River (q.v.) and enters Lake Ontario at Oswego. Length, including the Oswego, nearly 100 miles.

SENECA, or SENEGA, ROOT. See POLYGALA.

SENECA FALLS, N. Y., village in Seneca County, on the Seneca River and Barge Canal, near Cayuga Lake, and on the New York Central and Hudson River Railroad, about 160 miles west by north of Albany, and 37 miles west by south of Syracuse. Electric lines connect the village with Cayuga Lake Park, three miles distant, and with Waterloo and other villages. A fall of 50 feet in the river affords extensive water power for manufacturing, and explains the name of the place. Seneca Falls is in an agricultural and fruit-growing region. The chief industrial establishments are machine shops, woolen factories, fire-engine and pump works, grist mill and furniture factory. The shipments are chiefly farm products, fruit, dairy products, pumps and fire-engines. There are three banks; the national bank has a capital of \$100,000. The educational institutions are a high school, the Mynderse Academy, public and parish elementary schools, private business schools and a public library. The government is vested in a village president and a board of trustees. Benevolent institutions include a hospital and the Johnson Home for Indigent Females. Seneca Falls was founded in 1791 and received its charter of incorporation in 1831. Pop. about 7,000.

SENECIO, sē-nē'sī-ō, one of the largest known genera of plants, comprising about 1,000 species; it belongs to the family *Asteraceæ*, and is universally distributed. It is, therefore, practically impossible to give a compact description of the generic characters; but it may be said that these plants are annual or perennial herbs, shrubs, or even arborescent, have basal or alternate leaves, and solitary, corymbose or paniculate heads of flowers, usually yellow in hue. These are made up of both radiate and tubular flowers, the latter being five-toothed and perfect, or of the tubular ones alone, on a

flattened or slightly convex receptacle. The involucre surrounding each flower head is cylindrical or campanulate, with its principal bracts in one series, distinct or slightly united at the base, and encircled very often with a ring of shorter scales. The achenes are mostly terete or compressed, sometimes curiously papillose. After wetting, these papilla put forth pairs of spiral hairs which secrete adhesive mucilage. The generic name has been derived from the Latin *senex*, an old man, in reference to the tuft of soft bristles surmounting the achene, and mostly white. These parachutes have so well distributed the seeds of the common groundsel (*S. vulgaris*), originally European, that it is found all about the civilized temperate zone as a troublesome weed. It is a more or less glabrate annual, about a foot high, with spatulate pinnatifid leaves and rayless yellowish heads in corymbs. It blooms at all seasons, and is often sold in English cities as food for cage-birds. At one time it was even regarded as a love charm, and was said to have formed a part of the Virgin's bed. It was also of old repute for poulticing. *S. aureus* is a charming, slender, American species, with cordate basal leaves, called golden ragwort, and blooming in the spring. Squaw-weeds are other species of *Senecio*.

The plants known as *Cinerarias*, having dark-blue rays,—a rare color among composites,—are greatly cultivated and hybridized, but not many other *senecios* are valued in horticulture. Among these are the familiar German ivy (*S. mikanioides*), an easily propagated, rapidly growing, glabrous, twining vine, with small yellow flowers in axillary or terminal clusters, and glossy, deltoid-ovate leaves; and the Cape ivy (*S. macroglossus*), a beautiful greenhouse climber with golden flowers as large as marguerites and ivy-like leaves. One of the "dusty millers" is *S. cineraria*, a tall perennial, enveloped in white wool, and with small compact corymbs of rayless flowers. The handsome *S. pulcher*, with reddish-purple rayed flowers, of strong growth and cobwebby foliage; the great *S. japonicus*, over five feet high, and extremely ornamental, with its large palmate leaves, and large yellow flowers; and *S. petasites*, valuable for its large panicles of big, yellow fragrant flowers, blooming in mid-winter, are also cultivated.

SENEFELDER, zā'ně-fēl-dēr, Aloys, Bohemian inventor of lithography: b. Prague, 6 Nov. 1771; d. Munich, Bavaria, 26 Feb. 1834. The son of an actor, in early life he tried unsuccessfully to be both actor and dramatist. Having learned something of printing he conceived the idea of inventing a process of his own, and was finally led by accident to his great discovery of lithography (q.v.). Subsequently he made important improvements, contrived a press, procured a patent and set up an establishment, which he carried on successfully. In 1809 he was appointed inspector of the royal lithographing establishment. He published the 'Elements of Lithography' (1819), a curiously illustrated work, which he translated into English and French. Consult Nagler, 'Aloys Senefelder und der Geistliche Rath Simon Schmidt' (1832); Pfeilschmidt, E., 'Aloys Senefelder' (Dresden 1877); Muller, J.

W., 'Invention of Lithography' (New York 1911).

SENEFELDER, Leopold, Austrian physician: b. Vienna, 25 Sept. 1864. He was educated at the Preparatory Seminary of Maria-schein, the Mies Gymnasium, Bohemia, and the University of Vienna. In 1888-89 he served as interne at the Garnisons-Spitale No. 1, Vienna, was physician to the reserves and assistant physician at Rudolf Hospital, Vienna, in 1889-91. He established a practice at Sankt Pölten, Lower Austria, in 1892 and at Vienna from 1893 to 1905. After 1908 he was lecturer on the history of medicine at the University of Vienna. In 1902 Dr. Senefelder accompanied Cardinal Gruscha to the Jubilee Celebration at Rome. He is librarian and archivist of the Vienna College of Physicians and has published 'Anathema esto?' (1892); 'Die Katakomben bei St. Stephen' (1902); 'Die kaiserliche königliche Weiberstrafanstalt in Wiener-Neudorf' (1903); 'Dispensatorium pro pharmacopœis Viennensibus in Austria' (1907); 'Acta Facultatis medicæ universitatis Vindobonensis' (Vols., IV, V, VI, 1908-11). He collaborated in 'Geschichte der Stadt Wien' (1904) and contributed to various periodicals.

SENEGAL, sên-ě-gâl', West Africa, (1) a river which flows into the Atlantic near Saint Louis, the capital of the French colony of Senegal, in lat. 15° 48' N. It is formed by the union of the Hafing and the Bakhoi, at Bafulabé, the former rising in the Futa-Jallon Mountains, southwest of Timbo, and the latter near Wosebugu. From the opposite or western side of the mountain in which the Bafing rises springs also the Falemé, another great branch of the Senegal, which runs north in a more direct course until it joins the united head streams above Bakel. The Senegal is about 1,000 miles long, and is navigable up to the cataracts of Félou in Kassan, about 700 miles from its mouth. A river service from Saint Louis to Kayes, 460 miles, is maintained during the flood season, and a railway line has been built from Kayes to Bafulabé (82 miles), and is being extended to Bamaku and Tulimandis on the Niger. The delta is marked by numerous *marigots* or channels which disperse its waters through the adjacent plains; and its mouth is dangerously barred, so as to be accessible only for small vessels in the dry season. Dredging operations are in progress to facilitate navigation. (2) A French colonial possession comprised in the government-general of French West Africa, named after the river and comprising the coastal strip from the British colony of Cambia north to Cape Blanco and extending inland to the French military territories of Niger and Mauretania. By a decree issued in 1899 the colony of Senegal was extended so as to include the western part of the former French Sudan territory. The area of Senegal is now about 74,012 square miles. The whole is under a lieutenant-governor, who has direct jurisdiction in the communes of Saint Louis, the capital, on the coast, Dakar, the chief port, near Cape Verde, Goree and Rufisque. Several other districts are under administrators. The colony is represented in the French Chamber by one deputy. Dakar is fortified, and there is a military force of about 3,000 men, nearly

one-half of them natives. The budget of the directly administered territory in 1916 amounted to \$1,280,909, and the local budget, \$413,916. All towns having a sufficiently numerous European or assimilated native population have urban schools, giving the same instruction as the French primary schools, modified to suit local requirements. At Dakar there is a superior technical school. At Saint Louis are a normal school for the training of native teachers, of interpreters, kaidis (native judges) and chiefs' sons. There is a Mussulman superior school at Saint Louis with 20 pupils, and there is a large hospital for natives at Dakar. Millet, maize and rice are cultivated by the natives; the natural products include gums, castor-beans, earth-nuts, cocoanuts, rubber and kola. A salt industry is being developed. Cattle, sheep, goats and camels are domesticated, and some weaving, pottery-making and other industries are carried on. In 1913 the imports were valued at over \$16,000,000, and the exports, consisting chiefly of earth-nuts, gums and rubber, at over \$14,000,000, the trade being chiefly with France, although steamers ply also to Liverpool and Hamburg. In 1916 751 miles of railway line were open, the chief line being the coast line between Dakar, Rufisque and Saint Louis. In the same year there were also 1,494 miles of telegraph and 100 miles of telephone line in operation. A submarine cable connects Dakar with Brest. There is a river service on the Senegal from Saint Louis to Kayes (490 miles). Dakar has regular communication with French ports by the steamers of four French lines, and also with Liverpool and Hamburg. The French first settled Senegal in 1637. It was taken by the English in 1756, retaken by the French in 1779 and subsequently held by the English until the peace of 1814. The settlements did not flourish until the appointment of General Faidherbe as governor in 1854. He began a vigorous line of action, subdued the Berber chiefs who prevented the French advance inland and annexed their territories. This policy was pursued in the same spirit by subsequent governors; districts were annexed and protectorates proclaimed with extraordinary rapidity, though the two powerful chiefs Ahmadou and Samory occasioned a great deal of trouble, 1887-90. Pop. 1,282,566. Consult Lasnet et al., 'Une mission au Sénégal, ethnographique, botanique' (Paris 1900).

SENEGAL-NIGER, Upper, French colony forming part of the government-general of French West Africa. It is bounded on the north by the Algerian sphere; on the west by the Felémé River and the frontier of French Guinea; on the south by the frontiers of the Ivory Coast, Gold Coast, Togoland and Dahomey, and now includes Fada-N'Gourma and Say, and on the east by the military colony of the Niger. It, therefore, includes the valley of the Upper Senegal, more than two-thirds of the course of the Niger, the whole of the countries enclosed in the great Bend and a large part of the Sahara to the Algerian sphere of influence. The area is about 568,273 square miles with a population in 1914 of about 5,778,296 natives and 1,269 Europeans. The colony was formed in 1904 from the territories of Sene-

gambia and the Niger, less the Senegal Protectorate, which was restored to Senegal. At the same time the military territories were broken up and became a part of the colony. The first military territory was incorporated in Upper Senegal-Niger, and is administered by a colonel under the authority of the military governor; the second territory was handed over to the civil administration and the third is still an autonomous unit. Upper Senegal-Niger is entirely under civil administration, with the same judicial and educational systems as the other colonies comprised in the government-general. The budget of the colony for 1916 amounted to \$1,788,641; the local budget for 1914 was \$1,918,981. The most important and populous towns are Bobo-Dioulasso (8,736 inhabitants), Bamako, the capital (6,553), Sikesso (7,544), Segou (6,550), Kayes (5,900). All the principal towns have urban schools. There is a professional school at Kayes and a school for sons of chiefs. There is a Mussulman superior school at Timbuktu (5,100 inhabitants), which has 67 pupils. The natives cultivate ground nuts, maize, millet, cotton and rice; rubber and kariti are also produced. The principal native industries are pottery, jewelry, brick and leather-making and weaving. Cottons, foodstuffs and metal work form the chief items of import, while cattle, ground nuts, hides, wool and rubber are exported. In 1912 there were 4,050 miles of telegraph line and 74 miles of telephone line. The Senegal-Niger Railway extends from Kayes to Koulikoro, a distance of 349 miles. Small steamboats ply between Koulikoro and Timbuktu. In 1914 the imports into Upper Senegal were valued at \$1,079,426, and the exports amounted only to \$462,164. The Niger (territory) is farther inland than Upper Senegal, therefore, more remote from the seaports through which all West African trade must pass; in consequence the over-seas trade is inconsiderable. The value of the imports into the Niger in 1914 amounted to \$193,117, the principal articles, in addition to government purchases, being cotton goods and tobacco; the exports reached \$117,656 in the same year and consisted mainly of cattle, hides, ostrich feathers, native salt and tanned sheep and goat skins. Consult Lenfant, 'Le Niger' (Paris 1903); id., 'La grande route du Chad' (ib. 1904).

SENEGAMBIA, sĕn-ĕ-gămb'ĭ-ă, West Africa, so named from the Senegal and Gambia rivers (qq.v.), an extensive region comprising the countries between lat. 10° and 17° N.; long. 4° and 17° 30' W.; bounded on the north by the Sahara, south by Guinea and west by the Atlantic. The area is estimated at from 400,000 to 700,000 square miles, and is almost wholly under French influence, with the exception of Bissagos Island and some coast territory at the mouth of the Rio Grande River, belonging to Portugal, and the British Gambia colony at the mouth of the Gambia. The name Senegambia is not used by the French, who call their colony and protectorate Senegal (q.v.). The western portion of the country is a low, flat and, to a great extent, swampy plain. East of this the country is mountainous, and the valleys run north and south. The principal rivers are the Senegal, the Gambia, the Jeba or Rio Grande and the Nuñez. In the level tract bor-

dering the coast the rivers during floods overflow their banks, inundating the plains, and become connected with one another by means of canals. On the lower Senegal, so far as the inundation reaches, vegetation is very luxuriant. Rice, maize and other grains, with bananas, manioc and yams, are cultivated equally on the hills and plains. The orange, citron and other fruits introduced by the Portuguese are now extensively cultivated on the hills. Wild animals comprise the elephant, hippopotamus, monkey, antelope, gazelle, lion, panther, leopard, hyena, jackal, crocodile, etc. The climate is intensely hot and unhealthful for Europeans. The inhabitants are of many races, the principal being the Yoloofs, Foolahs and Mandingoes. These negro tribes inhabit for the most part Middle Senegambia, between the Senegal and the Gambia. Upper Senegambia, to the north of the Senegal, is largely inhabited by Moors, who carry on an extensive trade in gum, etc., with the Europeans. The total population is estimated at 12,000,000.

SENEY, sĕ'nĭ, George Ingraham, American banker: b. Astoria, Long Island, N. Y., 12 May 1826; d. New York, 7 April 1893. He was educated at the Wesleyan University and at the University of the City of New York where he was graduated in 1847. He engaged in the banking business and in 1877-84 was president of the Metropolitan Bank, New York. He lost heavily at the time of the bank's failure in 1884, but later succeeded in partially re-establishing himself financially. Before 1884 his benefactions amounted to about \$2,000,000. He gave \$500,000 to establish the Seney Hospital in Brooklyn and \$500,000 to both the Wesleyan University and the Methodist Orphan Asylum in Brooklyn. He also gave \$250,000 to Emory College and the Wesleyan Female College, Macon, Ga., and liberal sums to other public institutions. He sold his famous collection of paintings at auction in 1885, receiving \$406,910 for them. From a later collection he gave 20 valuable paintings to the Metropolitan Museum of Art, New York.

SENIJEXTEE. See SALISHAN INDIANS.

SENILE DISEASES. See OLD AGE AND ITS DISEASES.

SENILITY. To obtain a clear conception of senility we must consider old age as consisting of two periods, the presenile and the senile. Physiologically these periods exist and are divided by a critical period called the senile climacteric which occurs about the 70th year. This period corresponds to puberty during the period of development and the menopause and the male climacteric during the period of maturity. The senile climacteric, like the male climacteric, usually causes so little distress that it passes unnoticed. Occasionally those around the aged person notice marked changes in mentality, more profound physical changes, greater debility, while some prominent manifestations of senility will appear less pronounced. In some cases the climacteric changes are very evident and the person passes rapidly from a condition of bright middle-aged mental and physical activity into a state of senile decrepitude.

During the senile climacteric the organs and tissues which have degenerated slowly now

break down rapidly and the degenerative processes which have gone on rapidly before become less active. There is really a readjustment in the degenerative processes and this is followed by the progressive degeneration of all the organs and tissues and a diminution in their functions.

The *toute ensemble* of senility is characteristic. The stature is diminished through the greater curvature of the spinal column, flattening of the pelvis, depression of the heads of the femurs and, generally, broken-down arches. A further apparent diminution in stature is occasioned by the attitude of aged persons. The head sinks down and forward, the knees are bent to maintain equilibrium and there is a general slouching appearance which is partly relieved when a cane is used. The skin becomes pale and thin and, owing to the waste of subcutaneous fat and muscle, it becomes flabby, wrinkled and falls into folds. The teeth fall out, the alveolar process in which the teeth are imbedded wastes and there is a waste of the bone substance of the lower jaw. When the jaws are now closed the lower jaw is drawn further up to meet the upper jaw and the small, weazened face of the aged is produced. The eyes become dull and there is generally a gray ring called the *arcus senilis* around the iris. The nose and ears become thin and pale, the lips become flaccid and darker in hue, the color being a fair indication of the extent of the blood impairment. The hair rapidly whitens or falls out but there is often a growth of hair in unusual places as in the ears, nose, chin and on the upper lip of women, etc.

The face is expressionless and it is seldom roused to reflect interest or emotion.

The mental changes in senility are peculiar. In those who have had little intelligence or education there is a gradual diminution in all mental faculties. Memory fails until the event of a moment ago is forgotten, reason and judgment are lost, interest can be aroused with difficulty and only with greater difficulty can it be maintained; only the most powerful sensory impressions are received, interpreted and get responses. The emotions are dulled, there is neither fear nor hope, joy nor sorrow, and the individual will smile or weep without apparent cause. Usually he is apathetic, gradually lapsing into a state of complete amentia in which even the fundamental instinct of self-preservation is lost.

The intelligent, educated person generally retains reason and judgment but the mind is less active and brain fag develops rapidly. Memory is impaired, recollections of early events coming unbidden while later events cannot be recalled by any effort of the will. Old persons find it difficult to displace old ideas, habits and hobbies by new ones, and they are, therefore, called old-fashioned. Imagination sometimes develops delusions, such delusions always possessing the element of self-aggrandizement. It is difficult to arouse interest or maintain attention. Under some extraordinary stimulus mental acuity will be revived but this lasts only a short time and is followed by mental exhaustion. Weak sensations are not received owing to the impairment of the sensory organs but the mind correctly interprets sensations that it does receive. The emotions

are dulled, there is seldom hope or joy, but usually there is a depressed, hopeless resignation to the inevitable. Sometimes religious teachings overcome the haunting fear of death, in some cases a materialistic philosophy makes the mind indifferent to death. Usually as the mind becomes weaker the fear of death and all other fears diminish; it is doubtful, however, if there is developed an instinct for death as Metchnikoff assumed.

Some individuals possess remarkable mental powers in old age. A critical study of the mentality of such individuals reveals in almost every case a concentration of mental faculties in one channel or direction while in every other direction there is profound mental impairment. The absent-mindedness and other peculiarities of these aged geniuses are really evidences of mental impairment. In the rare cases where the mental faculties retain their power with little or no impairment, the physical changes are slight and the whole process of senile involution is apparently retarded.

A remarkable phenomenon in senility is the approximation of the sexes toward a neuter type. The female chest gradually approaches the senile male chest in shape and the male pelvis becomes flattened until it resembles the female pelvis. In the male the hair on the face becomes thin while there is a growth of hair on the face of the female. His voice becomes higher, her voice becomes lower in pitch. The small weazened face and the dull expression give to both a similarity in features. It is a common observation that old couples resemble each other and through long association they exhibit similar mental traits. This phase of senility has not been sufficiently studied. While imagination undoubtedly plays a part in noting this resemblance it is in many cases sufficiently marked to attract attention. Virilence usually begins soon after the menopause; its counterpart in the male is rarely observed before the period of senility. See OLD AGE.

I. L. NASCHER, M.D.,

Author of 'Diseases of Old Age and Their Treatment.'

SENIOR, sē'nyōr, Nassau William, English political economist: b. Compton, 26 Sept. 1790; d. Kensington Gore, London, 4 June 1864. He was graduated from Eton and from Oxford, and in 1819 was called to the bar at Lincoln's Inn. He was the first professor of political economy at Oxford 1825-30; was appointed a master in chancery in 1836 and resumed his chair at Oxford in 1847. Of his writings, which comprise a number of excellent treatises on political economy, mention may be made of 'An Outline of the Science of Political Economy' (1836); 'Political Economy' (1850); 'Essays on Fiction' (1864); and 'Historical and Philosophical Essays' (2 vols., 1865).

SENLAC, sēn'lāk, or **HASTINGS**, Battle of, the one battle in the Norman conquest of England. It was fought 14 Oct. 1066 at Senlac Hill, a few miles from Hastings, between William, Duke of Normandy, and Harold II (q.v.), king of England. Harold's fortified position was attacked at 9 A.M. by the Norman army in three divisions, strong in cavalry and archers, the centre led by William in person. The English made a stout resistance with their battle-

axes and other weapons, but part of them pursuing William's flying Bretons, the whole body was led into a trap by the feigned retreat of many of the Norman forces, the disordered ranks of the English being easily overborne by their enemies, who stormed and carried the hill. The death of Harold, who was pierced in the eye by an arrow about sunset, disheartened his men and they shortly dispersed. Battle Abbey was erected by William on the field where Harold fell and portions of it still exist. Among the literary treatments of the event are two poems of Chatterton and a drama by Cumberland. Consult Green, 'The Conquest of England' (1899); Freeman, 'Norman Conquest' (Vol. III, 1876). See WILLIAM I.

SENN, Nicholas, American surgeon: b. Buchs, Switzerland, 31 Oct. 1844; d. Chicago, Ill., 2 Jan. 1908. He was brought to this country when a boy and settled in Wisconsin. He was educated at the Chicago Medical College and the University of Munich, was house physician at the Cook County Hospital 1868-69 and practised medicine in Wisconsin 1869-93, being at one time surgeon-general of that State. After 1893 he practised in Chicago, where he was attending surgeon of the Presbyterian Hospital and surgeon-in-chief of the Saint Joseph's Hospital. He was appointed in 1898 chief surgeon of the Sixth army corps, ranking as lieutenant-colonel of volunteers and chief of staff in the field. From 1884-90 he was professor of surgery at the College of Physicians and Surgeons, Chicago, and after 1890 professor of practical and clinical surgery at the Rush Medical College. He was also professor of surgery at the Chicago Polyclinic and lecturer on military surgery at Chicago University. Among his works are 'Four Months Among the Surgeons of Europe'; 'Experimental Surgery' (1889); 'Surgical Bacteriology' (1889); 'Principles of Surgery'; 'Tuberculosis of Bones and Joints'; 'Medico-Surgical Aspects of the Spanish-American War'; and a 'Nurse's Guide for the Operating Room' (1903).

SENN, Nelson Coelho de, Brazilian lawyer and author: b. Serro, Minas Geraes, 11 Oct. 1876. He was educated at the Normal School at Diamantina, Historical Institute at Rio de Janeiro, São Paulo, Niteroy and Ceará, and the Academy of Juridical Sciences, Ouro Preto. He has been successively secretary of the police and agriculture departments of his native state, professor of Brazilian and history at Mineiro Gymnasium, Bello Horizonte, and vice-president of the council of public instruction of Minas Geraes. He served in the first, second and third Latin-American scientific congresses. He is member of many learned societies both of South America and of Europe. His published works are 'Questões internacionais do Brasil'; 'A Edade da Pedra do Brasil'; 'Elogio literario de José Eloy Ottoni, poeta sacro brasileiro'; 'A Hulha Branca'; 'Los Indios del Brasil'; 'Contes Sertanejos'; 'Paginas de historia religiosa do Brasil'; 'Discursos Academicos'; 'A Bacia do Rio Doce,' etc. He edited *Anuario Historico e Estatistico do Estado de Minas Geraes* after 1906.

SENN, a nauseous, bitter but valuable purgative drug, obtained from the leaves of several tropical species of the leguminous genus *Cassia* (q.v.). The officinal species are shrubby

plants, with nearly regular, five-parted flowers in racemes and alternate, pinnate leaves subdivided into many leaflets. Alexandrian senna is formed of the leaflets of *Cassia acutifolia*, which are dried by cutting the shrubs until the leaflets shrivel and tumble off. *C. angustifolia* grows in and about Arabia, where it was used in domestic practice by the Arabs, who were apparently the first to introduce the drug to Europe. It is called Indian senna, as it is cultivated in South India. Bombay senna is a very inferior quality of this variety, much mixed with stalks and dead leaves; the variety Tinnevely, on the contrary, is the largest and cleanest senna in commerce. *C. obovata*, formerly of good repute, producing senna-pods and cultivated in India, is now classed among the inferior qualities and rarely met with except as an adulterant. Still other sennas are known under the name of the port of export, or place of growth. American or wild senna is the *Cassia marylandica*, a perennial abundant in the southern United States, sometimes eight feet high, with obtuse, oblong leaflets, numerous yellow flowers, with clawed petals and long linear pods. It has the qualities of Oriental senna in a lesser degree and was formerly used for the same purposes in popular medicine. Bladder senna is the *Colutea arborescens* and is also a purgative sometimes called bastard senna.

SENNAR, sā-nār', Anglo-Egyptian Sudan, a province extending between the Blue and the White Nile, from Khartum to Fazogl. It covers an area of 40,000 square miles. Generally speaking, it is a broad plain with occasional granite mountain heights and is at the north steppes thickly overgrown by wild grass and bushes; the southeast has tall forests intersected by fertile valleys. Gold and iron occur, and palms, tamarinds, etc., grow on the plain. Monkeys, lions, gazelles, giraffes, elephants, besides marsh and water-birds, are numerous; also domestic animals. The chief occupation is fishing. The products are rice, grain, melons, tobacco, sugar, senna, ebony and sandal-wood. The climate is exceedingly warm and during the rainy season is unhealthful. The inhabitants are negroes — the Funj, Nubian and Galla, and of mixed races, and are sometimes classified according to color. Slaves are imported. Sennar (pop. 18,000), the former capital, stands on the Bahrel-Azrik or Blue Nile. The other towns are Fazogl (or Famaka), Roséres, Wod-Medineh and Khartum. Near the latter town are the extensive ruins of Soda, the ancient capital of the Funj, a negro race, who migrated there from Central Africa in 1500 and founded the Sennar kingdom, which lasted until 1821.

SENNACHERIB, sē-nāk'ē-rīb, an Assyrian king, son of Sargon, succeeded his father on the throne 705 B.C. Among his first acts as king was the suppression of the revolt of Babylonia and after accomplishing this he directed his arms against the Aramean tribes on the Tigris and Euphrates, of whom he took 200,000 captive. He then reduced a portion of Media, till then independent; placed under tribute Tyre, Aradus and other Phœnician cities; advanced against Philistia, made war upon Egypt and finally marched against Hezekiah, king of Judah, who had revolted. Hezekiah, terrified, yielded in a panic, and paid the tribute exacted, namely, 300 talents of silver and 30 talents of

gold On his return to Assyria Sennacherib made another attack on Babylonia and afterward reinvaded Judah. Having marched through Palestine he laid siege to Libnah and Lachish and finding that his messengers Tartan, Rabсарis and Rabshakeh had failed in obtaining the submission of Hezekiah, he wrote an intimidating letter to Hezekiah; but before he could bring his forces against the city, according to the Bible record, a visitation from the Lord during the night caused the death of 185,000 of his troops. In consequence of this calamity Sennacherib returned to Nineveh and troubled Judah no more. From Herodotus we learn of the Egyptian tradition regarding the destruction of Sennacherib's host, which is, that a multitude of field mice devoured all the quivers and bowstrings of the enemy and gnawed the thongs by which they bound on their shields. No mention of the destruction of his host is found in the monuments of Sennacherib. This ruler was one of the greatest of the Assyrian kings and was not only a great warrior but also a great builder. His largest architectural work was the palace of Koyunjik, which covered an area of fully eight acres. Of the death of Sennacherib all that is known is contained in the brief Scripture statement of 2 Kings xix, 37 and Isa. xxxvii, 38, from which it appears he was murdered by his own sons. See ASSYRIA; ASSYRIOLOGY; BABYLONIA.

SEÑORA AMA, drama in three acts by Jacinto Benavente, was acted at Madrid 22 Feb. 1908. The story is one of peasant life on the plains of High Castile, a presentation of contemporary rural Spain as brilliant in color, but sordid and dead within, palsied with the degeneracy of a decaying civilization, from which all impetus and inspiration have disappeared, and merely husks of Church and State remain. Few dramas are of equal pessimistic power. As a veracious psychologic study, the play is of great value, depicting the sterility of the retarded country-side which is sunk in jealousies, sensuality and greed, where only the maternal instinct breathes unstunted amid the insentient fields. The minutest details are of unimpeachable realistic veracity. The author avoids any semblance of generalization. Yet in the absence of physical descriptions, the aspect of the Castilian plain and sierra is projected from the austere mentality of the peasantry with a rudeness of coloring and distinctness of outline which the Spanish painters have not surpassed. The sense of the motionless background provided by centuries of Spanish civilization is conveyed with the same economy of means. Upon the technical side the play is one for the artist. In illuminative insight and

potency of imaginative suggestion, although a work of pure realism, it rivals in completeness the universality of idealistic art. There is the customary lack of *coups de théâtre*, reinforced by a contemptuous disregard of the conventional conceptions of the stage. The first edition appeared at Madrid, 1908. Consult also Benavente, 'Teatro' (Vol. XVII, Madrid 1909). The English translation is included in the third series of the 'Plays by Jacinto Benavente' (New York 1917 et seq.).

JOHN GARRETT UNDERHILL.

SENS, France, archiepiscopal city and capital of an arrondissement in the department of Yonne, situated on the right bank of the Yonne River, 70 miles southeast of Paris. The city contains the cathedral of Saint Etienne dating from the 12th century and a fine city hall, which contains also a museum of precious stones, a library and an art gallery. Manufactures consist chiefly of fertilizers, farm implements, leather, glue, serge, etc., and there is considerable trade in wine, corn, hemp and flax. Sens was known in ancient times as Agenticum and later as Senones and was one of the largest cities of Gaul, vestiges of the old Roman walls still being visible. Pop. about 15,000.

SENSATION. This term is used broadly to designate any form of consciousness which originates immediately from the stimulation of the sensory end-organs of the nervous system (e.g., the eye or ear). This usage fails, however, to distinguish between sensation and sense perception. In the narrower psychological meaning sensation applies to the elementary forms of consciousness originating under the conditions mentioned. Sensations are in this technical sense cognizant of simple sensuous data, such as colors, tones, etc., whereas perceptions are cognizant of objects. For example, we perceive a sunset, a complex visual object displaying various color qualities, e.g., whiteness, redness, etc., of which we become conscious as sensations. These sensations are regarded as simple and incapable of further analysis. We perceive a musical sound when a note is struck upon the piano. This sound is made up of a simple fundamental tone and its overtones. Our consciousness of one of these simple pure tones is a sensation. On these terms sensation is evidently largely an abstraction of the psychologist. Our actual sensory consciousness is commonly cognizant of objects, i.e., is perceptual.

Certain authors extend the meaning of sensation so as to include not only all elementary sense qualities arising directly from sensory stimuli, but also all such qualities when aroused in processes of imagination, as when, for instance, one closes the eyes and gets a visual image of a rose. They speak, therefore, of peripherally and centrally originated sensations. In so far as this usage calls attention to the fact that the sensory and ideational elements are qualitatively alike, whether called out by central or peripheral stimulation, it is justifiable. But well-established custom is violated by the procedure and it may be questioned whether it will endure.

The commonly recognized groups of sensations are as follows: color, including brightness, sound, taste, smell, pressure, heat, cold,

pain, articular, tendinous, muscular, thirst, hunger, sex, circulatory (including tickling, itching, etc.), respiratory and static (dizziness sensations from the semi-circular canals of the ear).

Psychologists are wont to treat sensation under four principal aspects, i.e., quality, duration, intensity and extensity. Of these four quality is generally considered most basal. A sensation of tone, for example, may vary in duration without appreciable alteration of the pitch, which constitutes its most essential quality. Again, a color sensation may under certain conditions vary in extent without noticeable variation of quality. But a sensation which had no duration or no intensity would obviously be no sensation at all, and in general, if any aspect which a given sensation can manifest be reduced to zero, the whole sensation vanishes. Certain psychologists maintain that every sensation possesses all these aspects, but probably the majority hold that auditory sensations at least, and perhaps a few others, like smell, are lacking in extensity. Certain interesting facts concerning the relations of sensation intensities to one another are formulated in Weber's and Fechner's laws. (See WEBER'S LAW). According to Weber equal differences in sensation intensity are produced by relatively equal differences in stimulus intensity. If we place a weight of 20 grams upon the hand, we shall notice no change until we have added another whole gram, i.e., of the original stimulus. If we take a weight of 100 grams, we must now add not one gram but $\frac{1}{10}$ of 100 grams or 5 grams, before we notice a change. The same sort of relation holds for a number of the senses within the medium ranges of intensity.

Sensations depend upon the stimulation of specific end-organs connected with specific brain centres. No one ever gets visual experiences who does not possess an optical centre in the cerebral cortex and who has not at some time possessed a functioning retina. No one ever gets auditory experience without a similar use of the ear and the auditory cortex and the same sort of thing is true for each of the sensations.

The stimuli which produce sensation are classified as adequate and inadequate, internal and external, mechanical and chemical. The only pair which requires any explanation is the first. Each sense organ is fitted to respond primarily to some special form of physical stimulus, e.g., the eye to light, the ear to sound, etc. Such stimuli are called adequate. In addition to these adequate stimuli, however, the senses can be aroused by other forms of stimulation designated inadequate. Thus an electric current conducted to the frontal region of the head may produce sensations of light. Pressure on the eyeballs similarly occasions color sensations. It may be added that sensations often continue after the stimulus is removed. Such sensations are known as after-sensations. In the case of vision they present very remarkable characteristics and are commonly called after-images.

Sensations combined in various ways and re-instated in the form of memory and imagination furnish the basis of all our ideas. They are accordingly the foundations upon which rests the whole structure of knowledge. To understand their function in this particular it must be borne in mind that in actual experience they are not

mere naked qualities, but that they serve to convey meanings and that it is in this manner that they achieve fundamental import for mental life.

Bibliography.—James, 'Principles of Psychology' (New York 1890); Külpe, 'Outlines of Psychology' (1895); Bain, 'Senses and Intellect' (London 1855). For special senses see literature of special articles, VISION; ORGANIC SENSATIONS, etc.

JAMES ROWLAND ANGELL,
Professor of Psychology, University of Chicago.

SENSATION, Organic. The term organic sensation is nowadays applied broadly to all those sensations which originate from internal bodily stimulations. They are called forth by mechanical, chemical and thermal changes in the organism. Among the sensations which are commonly held to belong to this group may be mentioned pain, pressure and temperature from the interior of the organism; sensations from the muscles, tendons and joints; sensations from the alimentary canal; sensations from the circulatory, respiratory and sexual organs; and finally sensations which are supposed to originate from the semi-circular canals of the internal ear. These sensations are sometimes distinguished from the other forms of sensation like vision and hearing on the ground that they convey to us primarily a knowledge of the state of our own organism rather than knowledge about the external world. This distinction is, however, only roughly accurate.

The sensation qualities which originate from these senses can be described only with approximate accuracy, for psychological analysis has not succeeded as yet in unraveling all their complexities. Pain, pressure and temperature are familiar experiences requiring no description. From the muscles we obtain sensations which suggest dull pressure, becoming under conditions of fatigue somewhat unpleasant and in condition of cramp leading to distinct pain. From the tendons we obtain sensations which inform us of the movement of our limbs and particularly sensations of strain and resistance. It is generally held that from the joints we receive important sensations which also inform us of the movements of our limbs and in particular make us aware of their position. Certain authorities have called in question—both on anatomical and psychological grounds—the significance of the articular sensations. These sensations from muscles, tendons and joints commonly occur together and are sometimes spoken of in a group as the "muscle sense" or the kinæsthetic senses. Experimental devices are necessary in order to isolate them from one another. The circulatory processes are probably responsible for such subjective sensations as feverishness, shivering, "pins and needles," itching, tingling and tickling. Of course certain of these sensations are at times called forth by direct external causes. The heart itself occasionally gives rise to very distinct sensations, commonly of a painful character. The respiratory organs are probably responsible for our feelings of suffocation, of "stiffness" and closeness as well as for those of freshness and stimulation in the air. The alimentary canal occasions at least three specific qualities: hunger, thirst and nausea. Undoubtedly the processes of secretion and excretion affect the general tone of consciousness from time to time,

although, with the exception of the sexual organs, it is difficult to say whether they produce any real sensations apart from those already mentioned. The respiratory, circulatory, alimentary and sexual sensations are sometimes spoken of as the "vital sensations."

The semi-circular canals together with the vestibular portion of the internal ear are commonly regarded as responsible for our impressions of the movement of the body as a whole; but it seems certain that under ordinary conditions other senses contribute to these impressions and only in the case of dizziness is it at all clear that the sensations themselves are different from those hitherto mentioned. It is in any case reasonably certain that these organs constitute part of a reflex system by means of which the body equilibrium is maintained.

The term common sensation, or sometimes common feeling, has been applied more or less indefinitely to this whole organic group of sensations with special reference to the fact that our general feelings of vigor, health, discomfort, depression and so on depend upon them. When these terms are used at present they are more commonly applied to sensations like pressure and pain, which are conceived as widely distributed over the body and therefore as more or less common to the impressions gained from various sense organs.

Organic sensations are undoubtedly dependent like other sensations on the stimulations of sensory end-organs connected with centripetal neural pathways leading to the brain. These end-organs instead of being placed upon the surface of the body, like those of the more familiar senses, are imbedded in the various deep-lying tissues of the organism. A marked peculiarity of many of these sensations is their tendency to set up massive, widespread irradiating effects often quite remote from the seat of stimulation. This is probably brought about by means of the intimate connections of many of these organic sensory nerves with the sympathetic nervous system. This is less true of the kinæsthetic sensations and certain forms of pressure than of the remaining members of the group. Pain affords many striking instances.

The organic sensations play an extremely important part in the phenomena of feeling and emotion. In such emotions, for example, as fear and anger it is clear that a large part of the content of our feeling is made up by sensations of this character, e.g., sensations of tingling or flushing which come from circulatory changes in the skin, painful sensations from the region of the heart, sensations of choking which come from the respiratory passages, sensations of trembling which come from the motor mechanisms, and so on. The James-Lange theory of emotion makes the reflex stimulation of these organic sensations the cardinal fact in emotion whereby it is distinguished from other forms of consciousness.

These sensations are also held to possess distinct significance for the processes of memory and recognition. It is thus maintained by certain authorities that the characteristic psychological process when we recognize a familiar object is found in the arousal of certain of these organic sensations which are called forth by familiar objects, whereas a different set of organic qualities is aroused by unfamiliar objects. It seems fairly certain in any event that

the process of recognition is characterized by the presence of a definite mood and the specific qualities of our various moods are by general consent of psychologists determined by the presence of definite organic sensations.

Ribot and others urge furthermore the existence of "affective memory." By this they mean that in addition to our ability to recall ideas and in addition to our ability to remember whether any given past experience was agreeable or disagreeable, we possess the capacity actually to reinstate in some measure the original affective coloring of a past experience. This is brought about, they maintain, either by our capacity freshly to arouse the organic sensations which originally belonged to the experience, or by our ability to arouse the images or mental copies of these sensations. Certain psychologists deny the existence of these images. Without attempting a discussion of the merits of this doctrine it is safe to say that individuals vary vastly in the degree to which they actually possess this capacity of fresh arousal of either the organic images or sensations characterizing a former experience.

Aside from the particulars already mentioned organic sensations possess small value for the cognitive side of mental life. They bring us relatively little exact knowledge and in conditions of health come only infrequently to clear consciousness. On the other hand they are ordinarily marked with distinct feeling-tone, are definitely agreeable or disagreeable. Under conditions of health they seem to afford the basis of our feeling of well-being, a feeling which is sometimes vivid but usually dim and vague. They are very disagreeable and painful when the bodily processes are overtaxed, or disturbed in any way and it is in connection with such experiences that we most often find them coming distinctly into the foreground of the mind. The discomfort of indigestion, extreme fatigue and headache will illustrate the point.

Although their value for our knowledge processes is small, their significance for the life of impulse and volition is tremendous. The two great impulses represented by hunger and sex may suffice to illustrate this side of the subject. All our processes of will and the whole substructure of character are honeycombed with influences which originate in these impulses, and the impulses themselves are but the motor expressions of stimulations from organic sensations.

JAMES ROWLAND ANGELL,
Professor of Psychology, University of Chicago.

SENSATIONALISM, in philosophy the doctrine that our ideas originate solely in sensation and consist of sensations transformed. Locke has been classed with Condillac and other philosophers of the 18th century as holding the doctrine of sensationalism; but Locke teaches that "all human thoughts, even the most complex and abstract, are due to experience": they are all made up of "simple

ideas," and are due to phenomena of which we are percipient in the five senses, or else they are due to reflection on "the operations of the mind." Condillac most distinctly refers all ideas to sensation. He supposes a statue organized within like a man, but as yet without sensibility. He endows this statue with one sense after another till it becomes perfectly a human being, and holds that it then would possess exactly the same ideas as ourselves, though in its first state it had no ideas.

SENSE-ORGANS. See ANATOMY, COMPARATIVE.

SENSES, in psycho-physics, anatomy, physiological-psychology and in philosophy, specialized nervous apparatus and the psychological process by the stimulation of which (or its equivalent) qualitatively distinct sensations are produced. Sense is equivalent to the Latin word "sensus,"* the Italian "senso," the French "sens," and the German "sinn." A sensation — for to understand the import of "sense" it is necessary that one should understand "sensation" also — is that process of nervous or quasi-nervous irritation which can only be accounted for by the present operation of a stimulus or its equivalent upon a sentient being. It is the feeling that takes place while a sense-impression is made. A sense-impression is the effect of an event upon sentience. What is that sense-perceived something, an event in which affects sentience? It must be answered that it is designated by what is really one of the vaguest concepts in the whole realm of thought, an abstract notion, the idea of matter. For present purposes we shall define matter as anything which can affect the senses. Upon which notion we may build up one conception of "sentience," and define it as the "matter perceiving," as an American philosopher, Dr. Paul Carus, defined it.

The use of "sense" as equivalent to "consciousness," as in the phrases "time-sense," "sense of responsibility," and in 'sense of the heart' (the so-called *occult sense* of the mystic, Jonathan Edwards, who claimed by it one might know spiritual worth, truth, etc., by a kind of intuition), is confusing and inaccurate. (Consult Baldwin, 'Dictionary'). States of consciousness are nothing but the states of awareness or feelings connected with not only sensation, but also with perceptions, ideas and volitions. These states constitute the entire "subject." Memory and imagination are at times defined as senses — internal senses; but this distinction is psychologically of no particular importance. Sensation (in German "Empfindung," in French "sensation," and in Italian "sensazione"), is a word confined by definition to those sense-impressions fully realized in consciousness, and this definition excludes the

cerebral process of image-reproduction, etc., which is normally aroused in the absence of stimulation. It is at all times a very great advantage in thinking to recall that the terms "sense," "sensation," and even "matter" are, after all, at best concepts arrived at through a process of abstraction. For even so great a psycho-physicist as Ernst Mach (to cite one example) used "sensation" as synonymous with "reality" itself. Man generalizes, he marks and describes those features which a set of events has in common; but while generalizations are symbolized by mere words they deal with the events which are aglow with life or action. "Sense," "sensation" and "matter" are such mental symbols, and they represent not the whole of reality, but at most only a single set of its features respectively.

Organism developed from protoplasm whose potentialities are four in number; and an organism whose histologic units are four would seem to have also four psychic facultative manifestations. Irritability, contractility, metabolism and reproduction in the cell correspond to epithelium, muscle, connective tissue and nervous tissue in higher animal forms. In the mind they become sense, will, understanding and ideation. Epithelium has its analogon in "sense," and ideation, its parallel in "tissue formation," or "reproduction."

Professor Ernst Haeckel in one truly profound lecture, beautifully explains how each animal cell, and even each plant cell, is endowed with a peculiar kind of "soul-life" of its own. In higher animal forms, he tells us, there are formed through division of work special "soul-cells" of "nervous-substance." The lower we descend in the animal series the more the nervous system is simplified, and more, too, the nervous elements separate from each other, until finally they disappear merged in the mass of an undifferentiated organism. It is the same with all the other apparatus, with all the anatomical elements; and it would be as absurd to refuse sentience to an animal because it has no brain, as to declare it incapable of nourishing itself because it has no stomach. Sentience itself originates through contact and interaction of matter with matter. And the truth is that the nervous system arises like other systems from division of labor. Lower creatures are sentient, the higher brute animals conscious, but self-consciousness is found only in man who alone is aware that he knows.

To Demosthenes, the eloquent orator of classic antiquity, is ascribed the statement that all the senses are modifications of the sense of touch. Sentience is always an awareness of objects in external material existence. So too is it with the senses. Kant distinguishes two sources of knowledge — sensation and pure reason. Sensations are incidental and particular; come to us singly in a haphazard way and without affording any information concerning a necessary connection. The character of pure reason alone is the intrinsic necessity and universality of its statements. The sequence in which the specialized apparatus of each sense appeared in the evolutionary process is unknown. Touch, taste, sight, hearing and smell are at times said to represent that sequence. The senses originated through irritation received at the periphery of

* One may recall that the Latin names of the five senses, with the word "sensus" itself, are all of the fourth declension in that tongue, and are thus nouns having one form only to express both numbers. Awkward as is any form of these Latin words in English, students have come to it, and speak of "sensuses," and even of "visuses," "sensus," "visus," "auditus," "gustus," "olfactus," and "tactus," whether employed as Latin or as English words, are, however, all nouns which reveal number only in the accident of words with which they are grammatically connected. See the protest of H. H. Wilder, "Desmognathus Huscus [sic]," in *Science* (19 April 1918, New York); and the Reply of Professor Wilder by T. L. Casey in the same journal (21 June 1918).

an organism. Taste is most highly differentiated in man. Sight is perhaps keenest in birds and bees. Hearing is the strongest faculty of the hare. Smell is the peculiar faculty of the bloodhound and of the ant. Touch attains a high degree of perfection in the trunk of the elephant. The bee is sometimes said to possess a peculiar faculty, an "hygrometric sense," as it is named. This quality or power of the bee is attributed to the little animal owing to an inference based on its undeniable power to "detect" and avoid a coming storm. It is just possible, however, that the bee employs sight rather than an hygrometric sense to detect the approach of storms, and to avoid them.

Through experience, a nerve, the optic nerve, became adapted to waves of ether. There irritations are transferred to the optic ganglions, and there possibly the disturbance is accompanied by the awareness called light. So also a nerve, the auditory nerve, became adapted to air waves. The irritations effected by these waves are transferred to the auditory ganglion, where possibly the disturbance is accompanied by the feeling known as sound. All other nervous cells of specialized sense, whether olfactory (or of smell), gustatory (of taste), or tactile (of touch), arose in evolution and function in a way similar to the senses of sight and hearing. Along the whole line of nervous fibres, from the point where sense-impressions enter to the place where muscular contraction such as usually follows the transmission of a shock from sensory to motor nerves, there is, physiologically, one uninterrupted chain of nerve motion. Yet the feeling or consciousness which accompanies a sensation is no motion.

One does not exhaust the number of sensations, however, if indeed one does the number of the specialized senses, in any mere enumeration of the sense-organs. These latter are the eyes, ears, nose, tongue and skin. In addition to the sensations of vision, hearing, smelling, tasting and touching (all of which Aristotle enumerated long ago), are to be mentioned, if only for greater completeness, pressure, temperature, pleasure, pain, muscular sensations, sensations in the ears, and sensation from the inner contents of the body. Pain and pleasure (see IRRADIATION), muscle sense, sensations from the semi-circular canals and vestibules of the ear, hunger, thirst, sexual-sense, fatigue, and sensations from the visceral organs—are internal, or organic sensations. Suffocation, internal warmth and chilliness are others of the same class. In all one perceives the characters of ordinary sensation, the sense-process or psychic function involved in the apprehension of anything by the senses.

As belonging to the outer world one speaks of sensations and their complexes arising in our own body as organic sensations, because we locate them in our own body. Examples are sensation of fatigue of our muscles, and the pressure and pain sensation of our inner organs. The relatively uniform elements of touch and organic sensations are distributed among sensations of pressure, warmth, cold and pain. In contradistinction to these, the special senses of hearing, seeing, smelling and tasting present an abundance of sensations, each of which according to its peculiar constitution is called a quality of sensation. Each such qual-

ity is variable in its intensity. Qualities of sensations all refer to the objective world. Our own body, to which touch and organic sensations relate, forms in contradistinction to our consciousness (the subjective reality, our real selves) a part of the outer world;—nearest to us indeed, but still a mere part of the objective or external world. Subjective existence is constituted of those feelings or states of consciousness whose activity is no motion. Objective existence is represented by things whose activities are motions. Man has abstracted from a group of sense-perceptions an idea of his "body." The group of facts so collectively designated as "body," the action of which appears in constant connection with and as a condition of our consciousness, is kept in health only through constant renewal of its waste products out of the resources of the objective world, of which it is a part.

Sensations, while they are psycho-physical processes normally due to actual stimulation, can occur without any stimulation being present. Delirium and the manifold examples of what are wrongly called sense-illusions are cases in point. Audition colarée, which seems to associate sound with color, is an example of excessive associative power, a result of insufficient balance of associative capacity, whereby the less near is approached because of the loss of what commonly should have been associated. When an adult professes to perceive a color, for example, every time he hears a letter of the alphabet named, it is hypothetically safe to say that were an investigation undertaken, it might disclose that the colors which such an adult professes to "hear" are the very colors in which the letters were printed on the blocks from which as a child such an adult learned his letters. There is no recorded instance worthy of credit of what has been styled "sense-transference," either concerning people in the somnambulistic state (as has been claimed) or out of it. No person ever read, tasted, heard by the fingers, or the stomach or any parts of the body other than through those organs by which reading, tasting, hearing, as functions of the sense organs, are naturally performed. Those "higher" phenomena of clairvoyance prevision, retrovision, introvision and telepathy do not (in the ordinary sense of these words) exist at all. Mysticism of this sort colors the thought of only those people who in regard to some matters "spiritual" have strong convictions based on no evidence. The recollection of a sensation is nearly the same (but not the same) as an original sensation. For were it a sensation with a present stimulus then one might actually freeze to death through frigid imagination. Such recollection resembles the original sensation only (as being like it) a psychic event. By means of our senses we secure mental impressions through certain organs,—sensory or sense-organs,—concerning the world of objects, including impressions concerning changes in the condition of our bodies: and nothing more. There is a telepathy, or "far-feeling," however, which does not stand in miraculous contradiction to the mechanical interconnection of cause and effect in the external world. In and through our eyes most distant stars are seen. Only in this sense has telepathy any claim to recognition by scientific psychology. Yet the feeling feature of sensations is

purely subjective. Things are mirrored in our eyes; sounds are heard with our ears; and abstract notions are formed mentally to represent them. It would of course be very absurd to expect that the things represented in a sensuous-manifold should migrate bodily into our heads; and yet it would be equally as absurd as some far feeling telepathists profess to believe, that things or objects in the external world could be felt without the normal use of the sensory organs.

Though no animal has specialized more senses than five, many are much more sparingly endowed. Of very great importance as regards our enjoyments and our sufferings all knowledge besides has its roots in sensation. "All our knowledge," observed Gassendi long ago to Descartes, "appears plainly to derive its origin from the senses, and though you deny the maxim 'Quicquid est in intellectu processit debere in sensu,' yet this maxim appears nevertheless to be true; since our knowledge is all ultimately obtained by an influx or incussion from things external; which knowledge afterward undergoes various modifications by means of analogy, comparison, division, amplification, extenuation and other similar processes which it is unnecessary to enumerate." (Gassendi, in 'Objectiones in Meditationem Secundam').

Hallucination is a misinterpretation of sensations. The feelings are real enough in such cases; but the representations concerning what are supposed to evoke these feelings are not valid. Sensations become precepts, many precepts of one kind become concepts. From these concepts by the help of the reason abstractions are drawn. Thus all the objects of our surroundings are mirrored in their relation toward us and among themselves in the living substance of the brain.

Bergson attributes to intuition a peculiar power. (Consult 'Creative Evolution,' English trans. 1913). That there is something unique and new at every moment may be granted. That it is also true that that this cannot be fully expressed by means of intellectual concepts may be also granted. Only direct knowledge can acquaint us with what is unique and new. But direct acquaintance of this kind is given fully in sensation and does not (as Bergson contends) require any special mystical faculty of intuition, for its apprehension. It is neither intellect nor intuition (in the Bergsonian sense), but sensation that supplies new data. Bergson makes much of evolution. It must be pointed out that it is only through the intellect that evolution can be known. If the intellect is misleading the whole of man's biological ancestry which we know through the intellect is presumably an erroneous inference. Bergson's advocacy of intuition as against intellect is thus a self-stultification.

Kant distinguishes two sources of knowledge — sensation and pure reason. Yet the ultimate data of experience and the bases of all knowledge are sensations. These data of experience are the several states of consciousness, the elements of which are the sensory impressions, which fully realized in consciousness are sensations. Experimenting with the purely formal is indeed a kind of experience, and may be distinguished as inner experience, just because it is not merely a subjective process, but ideal. Objectively and scientifically the ex-

ternal objects of one's sensations are those sensations measured in terms of what we suppose to be their causes. We no longer feel, owing to long practice of projection, our sensations as states of consciousness, but conceive of an independent reality as given immediately. But sensation is nevertheless only the psychical feature of the data of experience, and in the idea of a sensation, the material and physical stimulus is excluded. All one's sensations are in one's self, not in their cause. We are conscious primarily of our self-sensing and of our feelings; and not with the objective world. What man knows of his environment is all pure deduction from his own conscious states, particularly deductions from the feelings attending sensations. All these deductions serve no other purpose than that of the explanation of these sensations in terms of what we affirm to be their causes. Into that side of human consciousness in which reasoned reflection has no part, the vast contexture of material existence finds entrance in terms of sound, color, taste, cold, heat, resistance, weight, hardness, shape, situation and motion. Whatever one can know of one's environment results when recourse has been taken by one to causation, a concept yielded by pure reason, which causality having been projected into the external world, renders an explanation of sensations possible. Boyle long ago observed that whenever one speaks of experience correcting reason, one speaks improperly; for, he observes, it is reason itself that corrects reason with information supplied by experience. Here it should be noted that man knows many natural phenomena not directly observable through the senses; for example, the chemical constitution of the stars.

The psychological characters of sensation considered without reference to the conditions of its production are hearing, vision, smelling, tasting and touching. All these (we infer) are the effects of external causes or facts. They are so many subjective methods of representing certain processes of the objective world.

Even sensations are a kind of abstractions. By abstractions are meant a singling out, and isolating, a separation of sense impressions, so that they can be held for thought. Our eyes, for example, abstracts certain ether vibrations called light and transforms them into vision. The ears abstract only certain air vibrations and we transform them into sounds. The muscular sense abstracts resistance and we transform this into an idea of corporeality. The skin abstracts temperatures yielding elements for our notions of heat and cold. So is it with all other sensations. They abstract certain features of reality, or facts, and impress us.

There is a firmly rooted muscular sense of rest, uneasiness and of exertion. Various muscular efforts occurring in the head and face have become associated with definite emotions. The labial nasal, and ocular external coverings are muscles of expression. Certainly the vocal muscles give the same kind of an expression, not visible but audible. (Consult T. H. Evans, on 'Some Curious Psychosensory Relationships').

There are no such things as illusions of sense. What is illusory is only an inference to which the feeling elements give rise in sensation. The sensation and its feeling are real psychic events; and it is indeed only by some

reality not merely sensible that even dreams can be condemned. What is illusory is manifest only in misinterpretation of certain experiences.

Vision, hearing, taste, smell and touch depend upon certain stimulations from without;—mechanical (touch), molecular (taste and smell), physical (sight and hearing), and muscular (muscular sensation). At times the required stimulation may be effected within the nervous system. The cerebral processes by which vision (for example) is produced may not only be started in the brain itself, but when so started may result in those identical interpretations which normally accompany the process when set at work by stimuli from the external world.

According to Roamnes there is a constant ratio between the amount of agitation produced in a sensory nerve and the intensity of the corresponding sensation. Weber states that if sensations are to increase in intensity by equal amounts the stimulus must increase by relatively equal amounts. His law is that the perceptible increment of sensation is proportional to the quantity of irritation. More precisely: In most cases the quantity of sensation is proportional to the logarithm of the quantity of irritation. Further researches in this direction were undertaken by Fechner, Volkman and Appel; and to their works the students of the subject may be recommended. It is entirely true that we do not experience sensation in the sense-organs. We feel the state of our nerves. The brain itself is the seat of all sensation.

Taste, smell, sight and hearing are operative because of special organs connected by special nerves with the brain. As to touch, while there are special organs, it is an unsettled question whether tactile sensations are conveyed by special nerves or by the ordinary sensory nerves of the skin. The organs of sense depend upon the alertness of the brain for efficiency. It is in fact the brain that sees, hears, etc. As sight, hearing and touch seem to be most concerned with the wants of the intellect, they are sometimes spoken of as the intellectual senses; while taste and smell, being intimately connected with nutrition, are known as the corporeal senses.

Cultivation of the senses, especially if begun in early life, will develop their usefulness. It produces the accurate hearing of the musician, the keen eyesight of the pilot, engineer and expert microscopist, and the accurate touch of the blind. But training may be carried to such an extent as to make these senses sources of misery. Certain persons are painfully conscious of the slightest discord; others almost instantaneously detect, with a feeling of disgust, the inharmonious blending of tints which, to the average person, are all in harmony; still others are made uncomfortable by an odor perceptible to no one but themselves. All the senses become accustomed to continued impressions, so that they no longer perceive their existence. This condition may prove a source of danger, for one may, for example, become habituated to harmful odors. Sense-education of the feeble-minded, as accomplished by Seguin and his wife, by "constant, assiduous, philosophical training," is a noteworthy achievement. It seems to be a rule, with but few exceptions, that when one

sense is lost or seriously impaired nature sharpens some other.

Touch, or tactile sensibility, enables us to appreciate by actual contact, the size, form and consistency of objects and the character of their surface. It is most sensitive in the margin of the lips, tip of the tongue, palms of the hands, and under surfaces of the fingers. Some writers speak of "general sensibility" as one of the senses, and include under this term, touch, muscular sense or the sense of pressure, sense of temperature, etc. The organs of touch are end-bulbs and tactile corpuscles. See **MUSCLE-SENSATION**.

Taste enables us to discover and recognize flavors. This sense resides in the tongue, soft palate, uvula, pillars of the fauces, tonsils and the upper part of the pharynx. The organs of taste are taste-bulbs and various papillæ. The nerves of taste are the gustatory branch of the fifth pair of cranial nerves and the lingual branch of the glosso-pharyngeal nerve. Only those substances can be tasted which are dissolved, and at the same time the mucous membrane of the mouth must be moist.

It is said that the German physiologist Valentin could detect a 100,000th solution of quinine. What we know of the different tastes are complex experiences made up of odors, motor experiences, pressure and pain sensations, visual elements and a far more limited number of taste elements than we suppose. Their number seems to be four: sweet, salt, sour, bitter. Of the physical stimuli of taste sensations we know even less than of the indefinite localized physiological organs of taste. Chemically different substances may even arouse the same sensational response; for example, both sugar and acetate of lead yield a "sweet" taste. Only one statement may be hazarded; namely, that the taste stimulus is always in a liquid form. Taste sensations and their brain area (little known) all involve attention, discrimination, judgment, and so on. The tongue tastes. It also feels. Aerated water is "felt"; alum "draws" the tongue.

The most satisfactory classification of smells as we meet them in nature is that adopted from Linnæus by the Dutch physiologist, Zwaardemaker. It recognizes the following classes: (a) Etheral smells, including all fruit odors; (b) aromatic smells, like those of camphor, spices, lemon, rose; (c) fragrant smells, like those of flowers; (d) ambrosiac smells, like those of musk; (e) alliaceous smells, like those of garlic, assafoetida or fish; (f) empyreumatic smells, like those of tobacco and toast; (g) virulent smells, like that of opium; (h) nauseating smells, like that from decaying animal matter.

Many smells are of course like tastes obviously complex experiences containing elements of taste, touch and vision as well as sensations of smell. The "pungency" of such smells as that of ammonia is a "touch" quality. Smell stimulus is gaseous, not liquid, and the property of stimulating the end-organs of smell is a function of the physical molecule, not of the atom, since most of the chemical elements are odorless.

Smell is the sense by which odors are perceived. The olfactory nerve is, like the optic nerve, a prolongation of the cerebrum. The olfactory bulb is at the anterior extremity of the

olfactory nerve (more strictly the olfactory tract), of which it is an enlargement, and the development of the bulb bears direct relation to the acuteness of smell. In some animals, in which smell is very acute, the bulb is of such size that it is called the olfactory lobe. In man the impressions of this sense often need to be confirmed through other senses. Odors, to be recognized, must be presented in a gaseous or vaporous form. Dryness of the mucous membrane of the nose and excessive secretion blunt the sense of smell. Some persons are so susceptible to odors and emanations that the smell of certain substances, as of roses, new-mown hay, etc., or of certain powdered drugs, may excite in them an inflammation of the nasal passages. Hay fever (q.v.) is one form of such inflammation. There is an intimate relation between smell and taste. Delicate flavors are not appreciated when the nose is obstructed, as by catarrh, etc., or in cases of anosmia (q.v.), loss of the sense of smell. Smell influences the respiratory process, and the breathing of a fine odor increases the amplitude of the respiratory movements. The sense of smell may be highly developed, especially where there is deficiency in other senses. By it certain blind and deaf persons are able to recognize anyone with whom they have previously come in contact. This delicate sense is impaired by oversecretion of the nasal mucous membrane (catarrh), by its dryness or its frequent irritation, and may be destroyed by disease or injury.

Sight is the faculty whereby we receive impression of light, movement, form, size, shades of color, and the manifold beauties of nature and art. The organ of sight is the eye, the nerve of sight, the optic nerve. Necessary also to proper vision are the eyebrow, eyelid, eyelashes, lachrymal and Meibomian glands, tear-passages, and certain muscles. Clear vision depends on the focusing rays of light through clear media upon the retina, and the conveyance of impressions so brought to the cerebrum by means of the optic nerves. Defects in vision are color-blindness, myopia, presbyopia, hypermetropia, astigmatism, etc.

Hearing is a sense whose organ is divided into three parts, external, middle and internal. The latter is essential, the others are accessory. Hearing is effected by means of impressions made by the vibrations of elastic bodies (ordinarily the atmosphere). Impressions of sound-waves are conveyed through the complex apparatus of hearing to the auditory nerves, and through them to the brain. Any interference with the delicate mechanism of the auditory apparatus, as by inflammation or injuries, blunts the sense of hearing. See ANATOMY, COMPARATIVE; NOSE; NOSE AND THROAT; SALIVARY GLANDS.

SENSITIVE PLANT, or **HUMBLE PLANT**, an herb (*Mimosa pudica*) of the family *Mimosaceæ*, a native of tropical America. It is an erect spiny or hairy plant with long-petioled pinnate leaves and numerous purplish flowers in roundish heads, followed by spiny, jointed pods. It is naturalized in many warm countries, and is cultivated as a curiosity in greenhouses and as a summer annual in gardens. The seeds are sown in early spring in any good garden soil and given ordinary care. The plants are chiefly interesting because of the movements of the leaves when touched. If only lightly

touched the leaflets close in pairs, but if more roughly the petioles become depressed. Young foliage responds more quickly, the movement usually occurring within one second after contact. In a few minutes the leaves gradually resume their former expanded position, the time required depending upon the age of the foliage, the warmth of the atmosphere, etc. At night the plants "go to sleep," that is, the leaves become depressed as after contact. Other species of *Mimosa*, especially *M. sensitiva*, a semi-climber, are also somewhat sensitive to touch.

SENSORY AREA, a portion of the brain in which the terminals of the sensory nerve-filaments finally end, constituting the cerebral centres of sensation. The location of the general sensory area is by no means definitely known. There are a number of sensory areas: thus the area for the sensations of sound is located in the superior temporal convolutions of the brain, and destruction of this area does not prevent the patient from hearing save when both auditory centres are destroyed, but does prevent him from the intellectual appreciation of what is heard. The sensory area for sight is located in the occipital region; for smell in the brain-base. The general feeling sense-area, however, the so-called sensory centre in the brain, is thought to lie below the motor area, somewhat overlapping it. It will probably be many years before the exact limits of the various areas in which the different sensory axones terminate are known. When that time does come, however, the student of the diseases of the mind will be in a much better position to understand the different variations in personality as shown in diseases of certain areas. Consult Flechsig, 'Gehirn und Seele'; Barker, 'The Nervous System.'

SENTENCE, a combination of words so arranged as to express a complete thought. A sentence is, therefore, the unit of thought expression and as such it determines the construction of words in accordance with their relationship to one another and to the sentence itself. Sentences have been classified in various ways. According to grammatical form, they are simple, compound and complex; agreeable to rhetorical construction they are classed as periodic, loose and balanced. A simple sentence contains but one subject and one predicate, and sometimes one or the other of these two essential parts may not be expressed; but in this case it is necessary that it should be understood. The suppression of the subject pronoun is very common in some languages, notably Spanish. A compound sentence contains two or more principal clauses; example, "The way was long; the wind was cold; the minstrel was infirm and old." A complex sentence must contain but one principal clause and one or more subordinate clauses: "The stag at eve had drunk his fill where danced the moon on Mona's Rill." A periodic sentence is so constructed as to hold the thought in suspense until its close: "Having come to the town early in the morning and having wandered about it all day, it was only in the evening that he went to pay the expected visit to his friend." A loose sentence, on the contrary, may be terminated in two or more places, each termination making complete

sense: "In the evening he paid the expected visit to his friend (after having come to the place early in the morning) and wandered about it all day." A balanced sentence consists of two parts similar in so far as their form is concerned, but frequently expressing a contrast: "She was an ornament to the society in which she moved; he was a disgrace to the mother who bore him." Sentences are also classified, according to their use, into declarative, interrogative, imperative and exclamatory. Most sentences are declarative, because a declarative sentence asserts something as a fact. "This road is long," "This road is not long," "This road may be long." These are declarative sentences because each affirms something. One affirms something that is positive, another affirms something that is negative, while the third affirms a doubt or a possibility of doubt in the mind of the speaker. An interrogative sentence, as its name implies, asks a question; an imperative sentence gives a command; and an exclamatory sentence makes a statement under the influence of strong feeling (hence in the form of an exclamation).

Parts of a Sentence.—A sentence may contain subject, predicate, complement, object and various modifiers. In general, in English, the subject and object must be expressed in an imperative sentence, when the pronoun subject is generally suppressed. The complement is used to express the completion of a verbal idea which the verb does not, of itself, complete: "This boy is already a *Man*." The sentence may have the same kinds of modifiers as the individual words. A subject or object, being a noun or the equivalent thereof, takes adjective modifiers; a verb admits adverbial modifiers; while a noun phrase may serve as the subject or object of a sentence, and as such may take an adjective modifier. Appositional nouns or noun phrases may also be used to modify, through the fact of their apposition, other nouns or noun phrases. Sentences are also sometimes classified as balanced or non-balanced. A balanced sentence has the words and phrases of one part so arranged that they correspond in position and form to those of another part: "Wherever a few great minds have made a stand against violence and fraud, there has been her spirit in the midst of them, inspiring, encouraging, consoling; by the lonely lamp of Erasmus; in the restless bed of Pascal; on the tribune of Mirabeau." A sentence should have clearness, force and unity. Of these three qualities unity is absolutely necessary for a perfect sentence. In other words a sentence should be a unit in substance and expression. (See RHETORIC). Consult Bloomfield, L., 'Introduction to the Study of Language' (New York 1914); Bosanquet, 'Logic' (London 1911); Kimball, 'Structure of the English sentence' (New York 1904); Lockwood and Emerson, 'Composition and Rhetoric' (Boston 1903).

SENTENCE, in law, is a judgment pronounced by the court or judge on a criminal, being the final determination of the court through a judicial decision, publicly and officially declared in a criminal prosecution. It is not the discretionary act of the court, but the judgment of the law, which it is the ministerial duty of the court to pronounce.

SENTIMENTAL JOURNEY, A. 'A Sentimental Journey Through France and Italy,' by the Rev. Laurence Sterne (1713-68), was the result of a seven months' trip that the author took for his health in 1765-66. On his return he completed 'Tristram Shandy' and, though delayed by serious illness, had written two books of 'A Sentimental Journey' by December 1767. These were published on 29 Feb. 1768, and added greatly to the reputation acquired through the former novel. Sterne's death, on March 18, left the book unfinished. What we have is a small volume usually regarded as one of the most original and choice books in English literature, though not of the highest quality. In France its reputation has been even greater than in England.

The book is essentially a more detailed and expanded form of the idea of the seventh volume of 'Tristram Shandy,' written while Sterne was in France in 1762-63, with his wife and daughter. Some of the characters and episodes are the same, as that of the mad girl Maria, but the book is composed from a more definite and special point of view; it was "designed to aid us to love the world and our fellow creatures better than we do." Hence, instead of describing show places and scenery or talking of anything in the usual tourist fashion, Sterne deals largely with chance acquaintance and humble adventure—with postillions, innkeepers, grisettes, monks, a starling, statesmen, chambermaids, traveling companions, the old officer, the mad Maria, and with such simple episodes as giving alms, buying gloves, breaking a harness. The aim, however, in all cases is to show the various subtle states of feeling and the sentimental relationships in all such situations. Apparently very rambling and episodic, the essence of the book lies in the delicacy and good-natured feelings of pity, appreciation, sensibility, benignity, or what not, that these various encounters arouse. One or two situations seem to be somewhat strained and are even mawkish and dangerous, but the general tone is cordial, humorous and charitable. Among the best known and characteristic are those of the monk, of the starling, and of Maria, who utters the famous phrase, "God tempers the wind to the shorn lamb." The style, like that of 'Tristram Shandy,' is detached and parenthetical and highly wrought, in detail; in general, it is digressive and episodic. It has much of the humor but does not essay the peculiar wit of the earlier book. Consult the 'Life of Laurence Sterne' by Percy Fitzgerald, the biographical criticism by Paul Stapfer, and H. D. Traill in the English Men of Letters series.

WILLIAM T. BREWSTER.

SENTIMENTAL TOMMY, a novel by J. M. Barrie, published in 1896. It details the life and development of a young writer and is taken to contain considerable autobiographic material. Its sequel is 'Tommy and Grizel' (1900).

SEOUL, sè-ool', SÖUL, or locally HAN-YANG, Korea, the capital of the country, on the river Han, about 70 miles by water from its mouth in the Yellow Sea, and 25 miles by rail from Chemulpo, its seaport. The city

proper is a short distance from the river, in a basin partly surrounded by heights, and enclosed by a wall. The former royal palace is the chief edifice, and with its grounds occupies over 500 acres enclosed by a lofty wall. Seoul is the seat of various foreign embassies; a Roman Catholic cathedral and a Confucian temple are other noteworthy buildings. Silk, paper, tobacco, mats, fans and similar commodities are the principal products of native industry. There are schools for the teaching of Japanese, French, Chinese, Korean, Russian and English, and an American Mission School, which is subsidized. Two Korean and 23 Japanese newspapers are published in Seoul, which is connected with all the ports of Korea and with the outer world by telegraph. Under Japanese rule considerable advance has been made. Electric lighting and electric street railways have been introduced, and there is railway communication with Chemulpo, Wiju and Fusan. Pop. about 303,000 including over 50,000 Japanese.

SEPARATE ESTATE. See LAW OF HUSBAND AND WIFE.

SEPARATIST SOCIETY OF ZOAR. See ZOAR, SEPARATIST SOCIETY OF.

SEPARATION. See LAW OF HUSBAND AND WIFE.

SEPARATISTS, in Church history, (1) Those who in the reign of Queen Mary of England refused to conform to the public services of the Roman Catholic Church. Among them was Mr. Rose, who was apprehended with 30 of his congregation while celebrating the Lord's Supper in Bow-church Yard, London. Another well-known Separatist was Mr. Rough of Islington, who with several others was burned at the stake by order of Bishop Bonner. (2) In Ireland the Separatists were numerous, consisting chiefly of the Walkerites, founded by the Rev. John Walker, who seceded from the Established Church of Ireland and founded a small church in Dublin, with the doctrines of the Sandemanians as their creed. Other Irish Separatists were Rev. Mr. Kelly and his adherents who left the Established Church and formed an individual and independent Sandemanian communion. The Darbyites of Ireland were Separatistic Millenarians from whom sprang the Plymouth Brethren. (3) The German Separatists seceded from the Lutheran Church in the 18th century and founded a Pietist sect in Würtemberg. Persecution drove them to emigration and they settled under George Rapp (q.v.) in Pennsylvania, where they founded the Harmony Society, calling themselves Rappists. Those who remained in Germany established themselves at Kornthal, under the name of Kornthalites. All who in Germany refused to conform to the German Evangelical Union, founded by Frederick William III of Prussia, were also known as Separatists. (4) The name was taken by some of the early Puritans such as the Traskites (q.v.). They were subsequently represented by the Quakers. Among the most important sects which have assumed this name are the Separatists of Zoar, a village of Tuscarawas County, Ohio. Their constitution is strictly communistic; they refuse to serve as soldiers; consider celibacy a higher life than marriage; reject all religious ceremonies, while maintaining the cardinal doctrines of Christianity. Although their numbers are consider-

ably under 1,000 they enjoy great prosperity; but, belonging as they do to the peasant class of Germany, are simple and uncultured. They have neither audible prayer, nor anything that corresponds with the office of a preacher or minister in their public services. Consult Gardner, 'Faiths of the World.'

SEPIA. See CUTTLEFISH.

SEPIOLITE, a compact, clay-like mineral of smooth feel, hardness 2 to 2.5, specific gravity 2. Owing to its porous nature it floats on water when dry. Color white or slightly tinted gray, yellow, red, or green. It is a hydrous silicate of magnesium, $H_2Mg_3Si_2O_{10}$. Extensive beds in Spain are utilized as a building stone. The mineral from Morocco is used in Algeria as a substitute for soap. It occurs as a secondary mineral derived from magnesite in the plains of Asia Minor, in alluvial deposits. The mineral from these deposits, popularly known as "Meerschäum" (q.v.), is used in the manufacture of tobacco pipes.

SEPOYS, sē'poiz, or se-poiz', the name given in India to the forces composed of natives, disciplined after the European manner. The French were the first to see that the transportation of troops from Europe to their Indian colonies would be too expensive and that Europeans would perish in great numbers by the exposure at sea and in the climate of India. They therefore took Hindus into pay and the English adopted the same policy. In 1900 the total strength of the native army in India was 155,249, and that of the European was 73,638. Though not generally equal in courage and dexterity to European soldiers, the Sepoys are hardy and capable of enduring much, and very temperate in their food.

SEPT-FOIL, a typical figure in Roman Catholic Church worship composed of seven equal segments of a circle, used to denote the number of the sacraments, gifts of the Holy Ghost, etc.

SEPTEMBER, the ninth month of the modern year, but the seventh of the old Roman year, which began in March. It has always contained 30 days. See CALENDAR.

SEPTEMBRISTS, in French history, the name given to the agents in the massacre which took place in Paris on 2 and 3 Sept. 1792, during the French Revolution. The numbers that perished in this massacre have been variously given; but the term has become proverbial throughout Europe for all that is bloodthirsty and malignant in human nature.

SEPTENNATE ACT, The. In the German Parliamentary elections of 1887 the struggle centred around the septennate, or seven-year army period. On 14 January the emperor dissolved the Reichstag and ordered new elections to take place. The government had proposed the addition of 40,000 men to the standing army, and sanctioned the maintenance of the present military force for another septennate. No previous army grant had been for more than two years. Prince Bismarck favored the measure. The emperor said, "The septennate means peace. Reject it and there will be war." But the delegates voted the supplies for three years only, and the chancellor, by a decree from the throne, dissolved the house. The government secured a majority of about

40 votes in the general election, 1 Feb. 1887, and on 11 March the new Reichstag passed the septennate bill.

SEPTENIAL ACT, 1716, superseded the Triennial Acts (q.v.) of 1640 and 1694. It extended the duration of a British Parliament to seven years. The Parliament Act of 1911 reduced the maximum duration to five years. This measure was suspended during the European War. See GREAT BRITAIN; PARLIAMENT.

SEPTICÆMIA. See BLOOD-POISONING; PYÆMIA.

SEPTUAGESIMA (sĕp'tū-ā-jēs'i-mā) **SUNDAY**, the third Sunday before Lent, so called from its being about 70 days before Easter (*septuagesimus*, 70th).

SEPTUAGINT, sĕp'tū-ā-jīnt, the oldest Greek version of the Old Testament. Although nothing is positively known of the origin of the Septuagint it is accepted as probable that we owe the work, also called the LXX, the Alexandrine Version, the Version of the Seventy, etc., to some Alexandrine Jews, who, having lost the knowledge of the Hebrew, caused this translation to be made by some of their learned countrymen, for the use of the synagogues, and called it the Septuagint from the great sanhedrin of 72 members. It dates from the 3d century B.C. At first only the Pentateuch was translated; and the version of the remaining books of the Old Testament was accomplished gradually, the whole being finally completed in the 2d century B.C. From the varieties of style shown in the version it is clear that there must have been several translators, though how many it is impossible to ascertain. The language of the LXX is the Hellenistic Greek of Alexandria, based upon the Attic dialect. The most skilfully executed portion of the Septuagint is the Pentateuch, next to that the book of Proverbs. The translation of the Psalms and Prophets is very indifferent. Of the Prophets the version of Jeremiah is the best, and that of Daniel the poorest. It is inferred regarding the Hebrew manuscript or manuscripts from which the version was made, that the letters were substantially the same as the present square characters, that there were no vowel points, no separation into words, no final letters, and that the words were frequently abbreviated. From the harmony found to subsist in a multitude of instances between the Septuagint and the Samaritan version, it has been surmised that the latter was the basis of the former; but the enmity existing between the Jews and Samaritans militates against this hypothesis. To explain the resemblance between the two versions Gesenius supposes them both to proceed from a common recension of the Hebrew Scriptures, and other hypotheses have been made. The Septuagint is the original of every ancient version of Scripture with the exception of the Syriac Peshito and the Samaritan. It was the sole standard of authority during the first four centuries, and has been the Bible of the Eastern Church from the first. Of 350 direct quotations in the New Testament from the Old Testament, scarcely 50 are found which differ materially from the Septuagint. It does not appear, however, to have obtained general authority so long as Hebrew was understood at Alexandria, nor can it be proved to have been commonly sub-

stituted by the Jews for the original in the synagogue service at an early period. It was, however, adopted by Philo and Josephus, and was universally received by the early Christians. In the transcription of the Septuagint, of which numerous copies were made, a great number of mistakes crept into the text. The task of rectifying it was undertaken by Origen, and the version as amended by him finds a place in his Greek Hexapla. The Septuagint is of undoubted value to the Bible critic, though the translation is not always literal, and misapprehensions of the meaning of the original are frequent. Glosses are very often inserted, and arbitrary paraphrases are numerous. The principal extant manuscripts known are the Codex Alexandrinus in the British Museum, the Codex Vaticanus in Rome, and the Codex Sinaiticus (imperfect) in Petrograd. The principal printed editions are the Complutensian (1517), the Roman or Sixtine (1587), the Oxford of 1707-20, the Oxford of 1798-1827 (Holmes-Parsons, five vols., folio), and the Cambridge edition by H. B. Swete (1887-94; 2d ed., 1895-99, three vols.). The Septuagint, which had been used by Jews and Christians long after Christ, was gradually superseded by other Greek versions, such as those of Aquila and Symmachus, representing more closely the Hebrew text as it latterly stood, but only small fragments of these now exist. There is a Concordance to the Septuagint by Hatch and Redpath. See BIBLE.

SEPULCHRAL ARCHITECTURE, a form of art whose purpose is to give beauty or magnificence to tombs or to buildings used only for purposes of sepulture. The term may be extended to represent even the ornamental treatment of headstones or slabs. No particular style of architecture belongs strictly to sepulchral structures; the fashion being largely derived from the styles of civic or religious buildings prevailing at the period. Some styles, it may be said, lend themselves more readily than others, at least for splendor of effect. Such for instance is the Gothic, in which style many beautiful specimens exist, particularly in the cathedrals and abbeys of England. In this style is the sepulchral church of Brou at Bourg-en-Bresse. A distinction is here to be noted between the practice of ancient and mediæval times. In the case of the former the tomb was a building, large or small, apart from structures devoted to the uses of religious worship. The pyramids of Egypt were the most imposing of all human structures; the mausoleum at Halicarnassus, one of the wonders of the ancient world. The buildings erected in memory of the Mohammedan rulers in northern India as well as the Taj Mahal are to be taken with the foregoing as not strictly tombs, but as belonging to the domain of sepulchral architecture. Of all the Aryan peoples the Romans were conspicuous for their imposing tombs, specimens of which exist in the remains of the tomb of Cæcilia Metella and the Mole of Hadrian, now called the castle of Saint Angelo at Rome. Belonging to the period of the Renaissance are the tombs of the Medici, erected by Michelangelo, though of these the sculptural features are more important than the architectural. One of the most perfect specimens of this period is the tomb of Loys de Brézé, erected by his wife Diane de Poitiers in the cathedral of Rouen, and at-

tributed to Jean Goujon and Jean Cousin. In America the most notable specimen is the tomb of General Grant, a structure resembling in general form the tomb of Cæcilia Metella. See MAUSOLEUM; MONUMENTS; SCULPTURE; TOMB; BURYING-PLACES.

SEQUESTRATION, in law, the act of taking possession of property by legal authority, as to satisfy creditors, for the use of the State, etc.; also, an equitable writ, directed to a sheriff or a number of commissioners ordering them to enter upon the estate of the defendant and to take the rents, issues and profits and to keep or pay out the same as the court shall direct. It is also used by chancery courts to force compliance with their decrees or orders.

SEQUIN, sē'kwīn, or sēk'īn, an Italian and Turkish gold coin. It was first struck at Venice about the end of the 13th century, and afterward in all the other Italian cities, and from the Levant was introduced into Turkey. The Tuscan sequin is worth \$2.30, the Turkish from \$1.10 to \$1.75.

SEQUOIA, a genus of *Coniferae*, included in the sub-family *Taxodioidæ*, of which the other genus is the *Taxodium* or deciduous cypress. The *Sequoia* genus (named in honor of the Cherokee chief Sequo-yah, who invented the alphabet of that tribe), was for a time known as *Taxodium* or *Wellingtonia*; it comprised two species, *S. sempervirens*, the redwood, and *S. gigantea*, the "big-tree," both natives of California. The genus was once widely distributed, as fossil remains testify, and the petrified forest in Arizona is stated to be composed of species of sequoia. The flowers of the sequoias are monoecious and are borne in scaly inflorescences as terminal or axillary shoots in such great profusion, that the pollen covers the ground beneath the trees during their winter blooming. The pistillate flowers mature into a fruit, or oval cone, having persistent woody scales, broadened at their outside ends into a rhomboidal flat top, very much wrinkled, and with a slightly prickletipped apex. Their scales are slightly separated to allow the many brown, compressed seeds to escape and then spin away on their lateral wings. The leaves are acute, compressed and keeled, decurrent on the stem, alternate and inserted in spirals, very scale-like on the branchlets, but on older branches linear and spreading.

The redwood, which was the first *Sequoia* discovered, is the more common species, and grows along the Pacific Coast just so far inland as the sea-fogs can go. It is a very straight, handsome tree, with columnar trunk, and spreading branches and branchlets, and reaches in some instances as great a height as the other and more famous species. See REDWOOD.

SEQUOIA GIGANTEA, the "big-tree of California," is more rare. It is found in 10 small groves, forming an uninterrupted "belt" extending for 200 miles on the western slope of the Sierra Nevada Mountains, and nowhere else in the world. It grows at elevations of 4,000 to 7,000 feet. This has suggested that possible lower growths were destroyed by glacial action. The Calaveras grove near the northern extremity of this series is the most picturesque and important group of big trees,

and was first discovered by J. Bidwell in 1841. These famous trees are the most massive of any in the world, but are not the tallest, being surpassed by the *Eucalyptus* trees of Australia. They are practically exempt from disease, and, if they were not injured by fire and by man, would have apparently an almost endless life. Some of them are judged, by the number of annual rings, to have been thousands of years old. Fully grown trees average a height of 275 feet, and a diameter of 25 feet. One of the most gigantic, cut down, with great difficulty, in 1853, was 302 feet in height, 96 feet in circumference, and after the bark was removed (which was itself nearly 18 inches thick, the diameter of the solid wood in the stump was 25 feet, 6 feet from the ground. This stump was used as a dancing floor, holding 40 or more persons. Others have been estimated as between 350 and 400 feet high. A section of one of these great trees has been placed in the Museum of Natural History in New York, and another in South Kensington, England.

The younger sequoias are very graceful, and charming in their dark blue-green foliage, being often grown in English and European parks. They have a straight, tapering stem from which the branches spring to form a narrow spire-like pyramid. After a few hundred years they begin to lose their branches, and become dome-like. Ultimately they become our picturesque trees, with a great trunk enlarged at the base, and strongly buttressed, fluted with low broad ridges, and covered with cinnamon brown bark (purple-tinted in the shadow) which follows the contour of the lobed trunk, and is deeply, longitudinally furrowed, and separated into fibrous scales on the ridges. This tapering shaft is naked for 100 or more feet, when great branches, eccentric in development, join in constructing the narrow, but massive domes which stand out above the other tall trees of the Sierras, and break into delicate but dense spray of much divided pendulous branchlets, blue-green when young but developing a bronzy tint when mature.

The big trees, while standing, have served as shelter for men and cattle, and are a constant attraction for tourists, the largest being known by name. One, the Wawona, in the Mariposa grove, has a portal cut through its base, which allows the passage of vehicles. But there is constant danger of their extinction. Only one comparatively unimportant and uninteresting group, the Mariposa grove, is efficiently protected. The others are owned by private interests and often by lumbermen, who cut down the magnificent trees for the sake of their light soft wood, bright red in the heart, and durable when in contact with soil, and which is dynamited apart, with enormous waste, and made principally into fencing and shingling. The big-tree has not the tremendous reproductive powers of the redwoods, the seeds have very low vitality, and in some groves almost no seedlings are found; moreover, the flocks of sheep pastured on the mountains destroy the saplings, and the dreaded forest fires not only decimate the patriarchs but devour the young growth. Consult Jeffrey, 'Comparative Anatomy . . . of the Coniferales,' pt. 1, Vol. V, Memoir Boston Society of Natural History (1903). See REDWOOD.

SEQUOYAH, sē-kwō'yā, or **GEORGE GIST**, or **GUESS**, Cherokee Indian inventor: b. about 1770; d. near San Fernando, Northern Mexico, 1842. He exercised his ingenuity in numerous ways,—as silversmith, blacksmith, artist. In 1821 he completed the Cherokee alphabet, for which he received in 1823 a silver medal from the Cherokee general council. This alphabet was perfectly adapted to the peculiarities of the Cherokee tongue, which it expressed as the English alphabet never could. He borrowed many symbols from an English speller. His alphabet was quickly adopted, was very successful, and was employed by the missionaries and, in part, in printing a newspaper, *The Phoenix*. The giant Sequoia tree was named in his honor. Consult Foster, 'Sequoyah, the American Cadmus and the Modern Moses' (Ithaca, N. Y., 1885); Mooney, J., 'Myths of the Cherokee' in *Annual Report*, Bureau of American Ethnology, Vol. XIX (Washington 1902).

* **SERAC**, a term applied to the ridges or ice pinnacles between closely spaced glacial crevasses. See **GLACIER**.

SERAGLIO, sē-rāl'yō, Constantinople, Turkey, the former imperial palace of the Osmanli sultans, occupying the extreme eastern part of the city proper, at the entrance of the Bosphorus. It stands on the site of ancient Byzantium and is of great historic interest. The existing buildings date from the time of Mahmoud II, and chiefly occupy the summit of a hill, which is surrounded by fine gardens, the whole being enclosed by ruinous walls, partly of mediæval origin. The entrance is on the west, near the church of Saint Sophia, by the Imperial Gate (*Babi Humayum*, the "Sublime Porte"), which leads into a court lined by the mint, the old church of Saint Irene (now an armory, with many interesting objects), a museum of antiquities (also of some interest), etc. Another gate, the *Orta Kapousi*, leads from this court into an inner one, which is surrounded by arcades and the former kitchens of the sultan, his wives and officials. The main part of the seraglio is then reached through the *Babi Saadet* or Gate of Felicity, formerly guarded by eunuchs. Here is the Hall of the Divan, where ambassadors were formerly received, councils held, and justice administered; the treasury, with beautiful and valuable collections; and the harem, where the sultan's wives were housed. There are also kiosks and other buildings within the enclosure. From the time of Mahmoud II, this palace was not regularly occupied by the sultans, and it therefore lost much of its former magnificence and interest. The word seraglio in Western parlance has come to denote a harem or place for the seclusion of concubines.

SERAING, sē-rāñ, Belgium, a town in the province of Liège, three miles southwest of the city of that name, on the Meuse river. The castle, formerly the residence of the Prince Bishops of the Church, was converted into one of the largest iron manufactories on the Continent. These extensive works cover a tract of 270 acres, and employ 10,000 men. The annual output is worth about \$9,000,000. All kinds of machinery are manufactured. Connected with the establishment are hospitals, orphan homes, savings banks, schools, etc.

Other industries are the glass-works (very extensive) and coal-pits. Shipbuilding is also carried on. During the European War (1914-18), the industries suffered exploitation and devastation at the hands of the Germans, for which reparation was subsequently enforced. Pop. about 42,000.

SERAJEVO, sã-rã'yě-vō. See **BOSNA-SERAI**.

SERAJGANJ, sē-rāj-günj', India. See **SIRAJGANJ**.

SERAMPUR, sēr-ām-pōr', or **SRIRAMPUR**, India, in Bengal, a town on the Hugli River, 12 miles north of Calcutta, and opposite Barrackpur. It has a school, church, college and library, connected with the Baptist Mission. The principal industry is the manufacture of paper and mats. The town under the name of Frederiksnager, belonged to Denmark until 1845, when it was purchased by the English East India Company. Early in the 19th century it was the scene of Baptist missionary activities, and contains the graves of Carey, Ward and others associated with the work. The town is attractive, and a summer resort for citizens of Calcutta. Pop. about 50,000.

SERAO, sã-rã'ō, **Matilda**, Italian novelist: b. Patras, Greece, 1856, the daughter of an Italian political exile and a Greek mother. She became a schoolmistress at Naples, and her experiences struggling with poverty during this period are related in the introduction to 'Leggende Napolitaine' (1881). At the same time she assisted her father in editing his newspaper, and contributed short stories of Neapolitan life to *Il Piccolo* and other local publications. She first attracted attention by 'Novelle,' a short story, followed by her first popular novel 'Fantasia' (1883). From 1880 to 1886 she lived in Rome interested in literary work with D'Annunzio, Scarfoglio and others, and published 'Cuore Inferno' (1881); 'Fiordi Passione' (1883); 'Piccole Anime' (1883); 'La Virtù de Checchina' (1884); and 'La Conquista di Roma' (1885). She married Scarfoglio and with him founded the short-lived *Il Corriere di Roma*; later returning to Naples where she edited *Il Corriere de Napoli* and subsequently founded *Il Mattino* and *Il Giornio*, which attained large circulations. She actively continued her book production. 'Ventre di Napoli' appeared (1885); 'Paese di Cuccagna' (1891); 'Addio Amore'; 'All'Erta Sentinella'; 'Castigo'; 'La Ballerina'; 'Suor Giovanna della Croce'; 'Paese die Gesu,' between 1892 and 1902; 'Storia di due anime' (1904); 'Dopo il perdono' (1906); 'I capelli de Sasone'; 'Sterminator Vesevo' (1910); 'Evvivia la Vita'; 'Ella non response'; and others. English translations of her chief works have appeared. Her early work distinguished for the vigor of its realism, acute sensibility and accurate observation, developed these traits with clearer insight and deeper psychological analysis in her later works. See **LA BALLERINA**; **PAESE DI CUCCAGNA**. Consult Croce, B., 'Matilde Serao' in *La Critica* (Vol. 1; Naples 1903); Dornis, J., 'Le roman Italien contemporain' (3d ed., Paris 1909).

SERAPEUM, the designation of Egyptian temples dedicated to the god Serapis. The Serapeum at Memphis was the most famous. It

was the cemetery of the Apis, and close to the Apeum, where the bull dwelt while in life. Within its precincts also were the dwellings of the priests, and a hospital for the sick, who flocked here to be cured by the dreams vouchsafed them by the god. The approach to the temple from the city was through an avenue of sphinxes. The ruins of the edifice, as well as the dromos of sphinxes, which had already become partially buried in the sand in the days of Strabo, were discovered by M. Mariette in 1850. After excavating a length of 7,000 feet, and uncovering 141 sphinxes, he discovered at the end of the avenue a semi-circle adorned with statues of the sages, poets, and philosophers of ancient Greece, and this is supposed to have formed part of the library of the Serapeum. Near this a transverse avenue led on the right to a temple of Apis, erected by Nectanebos, and on the left to the Serapeum itself. Further excavations disclosed the subterranean tombs of the mummies of the Apis. This great cemetery divided itself into two parts, the one, a vaulted gallery, containing 20 sepulchral chambers, of dates ranging from Rameses II to Psammetichus I; and the other, a souterrain, divided into a number of galleries, begun in the 52d year of Psammetichus I, and continued till the beginning of the Roman Empire. The bull mummies of this division were deposited in gigantic monolith sarcophagi of Syenitic granite, sometimes as high as 12 feet, with a length of 15 feet, and weighing upward of 60 tons. The dead bull was treated as a deceased human being, and the sarcophagi were accompanied by sepulchral vases and by the usual sepulchral figures offered to the dead. Votive tablets were placed over the lintels of the doors of the chambers, and as one of these always contained the date of the birth or discovery, the enthronement, and death or burial of the particular Apis, they have become of great importance in determining the chronology of the 19th and subsequent dynasties. They end with Ptolemy Euergetes II (177 B.C.). The discovery of 146 papyri now in various museums), dating from the 18th to the 24th year of Ptolemy Philometor, shows that the temple was under the direction of prefects, delegates, vicars, sub-administrators and storekeepers. Two priestesses also served Æsculapius and Serapis, and certain male devotees lived in celibacy and seclusion within the precincts of the temple, which they never left. A large number of bronze figures and various other antiquities were also discovered among the ruins. The tablets found numbered 1,200, and altogether about 7,000 objects were discovered, nearly half of them referring to the worship of the Apis. See EGYPT.

SERAPHIM, a plural Hebrew noun which occurs only in one passage of the Bible, Isaiah vi, 2-6, where it denoted certain heavenly creatures of human form but having each six wings, with one pair of which they covered the face, with another pair the feet, and with the third pair did fly. Their station was above the throne of the Most High, and one cried to another, "Holy, holy, holy is the Lord of hosts." The prophet was in terror, conscious of his unworthiness and that he was a "man of unclean lips." Thereupon one of the Seraphim, taking from the altar a live coal in his hand, with it touched Isaiah's lips, purifying them and purging

his sin. The Seraphim are in the later Jewish theology and in Christian angelology classed as the highest of the orders of angels, holding the first place in the first triad of the angelic hierarchy—Seraphim, Cherubim and Thrones. The word Seraphim, if it is of Hebrew etymology, means "burning ones." It is of the plural number, and the singular form is Seraph.

SERAPHIM, Order of. See ORDERS, ROYAL.

SERAPION, physician of Alexandria, of the sect of the Empirici, who flourished about the 3d century. He occupied himself almost exclusively with inquiries into the nature of drugs, and was a keen opponent of Hippocrates.

SERAPIS, sē-rā'pīs, or **SARAPIS**, an Egyptian divinity whose worship was introduced into Egypt in the reign of Ptolemy I. It is related by Plutarch and Tacitus that Ptolemy having seen in a dream the image of a god, which he was ordered to remove from the place in which it stood, sent to Sinope, on the suggestion of a traveler named Sosibius, and brought thence a colossal statue, which he sent up to Alexandria. It was declared to represent the god Serapis, affirmed by Manetho to be Pluto or the Jupiter of Sinope. A magnificent temple was built at Alexandria for the reception of the statue of Serapis, and this temple—the Serapeum—was the last hold of the pagans in that city after the introduction of Christianity. Another temple of this god at Memphis, beside the Apis cemetery, was discovered by Mariette in 1850. (See SERAPEUM.) The Egyptians themselves never acknowledged him in their pantheon, but he was the principal deity in the Greek and Roman towns, and was considered to be either Osiris, Æsculapius, Jupiter or Pluto. Forty-two temples are said to have been erected to him in Egypt under the Ptolemies and Romans; his worship extended also to Asia Minor, and in 146 A.D. it was introduced to Rome by Antoninus Pius. The image of Serapis perished with his temple at Alexandria, which was destroyed in 389 by the order of Theodosius.

SERASKIER, sēr-ās-kēr', the name given to the commanders-in-chief of the Turkish armies, and particularly to the Minister of War. As applied in the latter sense the seraskier has very extensive powers, and is second only to the grand vizier.

SERBIA (*Kraljevina Srbija*), a former kingdom in the Balkan Peninsula, now a constituent part of Yugoslavia, between lat. 42° 26' and 44° 59' N. and between long. 19° 18' and 22° 52' E. It is bounded north by Slavonia and Banat, the natural boundaries being the rivers Save and the Danube, east by Rumania and Bulgaria, west, after the Balkan Wars of 1912-13 and in conformity with the Treaty of Bucharest (1913), by Bosnia (from which it is separated by the river Drina), Montenegro, and Albania, and south by Greece. Its area is 33,891 square miles, of which 15,241 square miles were added after the Balkan Wars.

Topography, etc.—The greater part of the country with Shumadiya (forest-covered land) as its centre, forms a high plateau in which intermingle the four mountain systems: the Dinaric Alps, the Carpathians, the Balkans and the Rhodopes. The Carpathian system is slop-

ing gradually from Banat into Serbia across the Danube where it is broken by a very narrow defile, below Orsova, called "Djerdap" (Iron Gate) and consists chiefly of schist and other crystalline rocks and partly also of chalky limestone interrupted accidentally by certain species of rock of volcanic origin intermingled with different ores and coal. The high plateau formed in the northeast by the Golubnje mountains, between the rivers Morava and Timok, the precipitous heights in the mountain range Lukavitzza (with *Rtanj* 1566 metres), the deep gorges and snow-covered summits of the Suva Planina and Shar Planina, offer most picturesque and romantic scenery. The mountain range in western Serbia with the Kopaonik, Jastrebac, Jadar, Rudnik, Cer, Ovchar, Kablar, Cer, etc., encircle central Serbia, which is densely covered by woods (oak, beech, pine, etc.). The Macdva and Morava valleys are considered the most fertile and beautiful regions of the kingdom. The rivers for the most part flow to the north, and none of them is navigable although the Morava, which traverses the land and divides it in almost two equal parts, and the Drina have large volumes of water. The Danube and the Save are navigable for small boats, and their banks are for the most part very low; thus they irrigate abundantly the adjacent valleys. Among the tributaries of the Danube the most important are the Save, the Morava, the Timok (which with the Danube separate Serbia from Rumania), the Mlava, the Pek and Porechka. Of the tributaries of the Morava the principal are the Nishava and the Ibar. The newly acquired territories of Old Serbia and Macedonia are watered by the Vardar, which might eventually be joined to Morava and form thus a most important waterway from Belgrade to Salonica, the Bregalnica, the Drim (or Drin), the Crna and the Treska.

Climate and Soil.—On the whole the climate in Serbia is centro-European, although the country is situated in the same latitude as northern and central Italy. Alongside the Save and the Danube the climate is rather temperate, the average annual temperature being $+13^{\circ}\text{C}$., varying between $8, 34^{\circ}$ and $15, 63^{\circ}$, but the more one goes to the south the more rigid winters prevail, which may be explained by the mountainous configuration of the soil of central and southern Serbia. Severe winters prevail in the region between the Suva Planina and Rudnik, lasting sometimes five to six months, and very low temperatures have been recorded, the lowest, however, being -25°C . Rains are abundant, especially in the spring and autumn, and most frequent in October, but summers are often alarmingly droughty, so that the peasantry often have recourse to superstitious rites ("dodole") and religious processions imploring Nature for rain. The most important winds are the Severatz (north wind) and the Koslava (east wind), neither of which, however, is as trying as in most other Mediterranean countries. The soil of Serbia is very fertile; all kinds of cereals growing in abundance, notwithstanding the very primitive manner in which they are cultivated. Of all the cereals maize is most widely cultivated for it serves as the principal food of the population. Wheat of a high quality is also grown and constitutes Serbia's chief

article of exportation. Of no less importance are barley and oats which grow in abundance and serve chiefly as food for horses. All kinds of fruit are cultivated, apples, pears, peaches, grapes, etc., but the most important are plums of which there are many varieties, especially in the districts of Kruseval, Macva, Sabac, Obrenovac and Kragjjerac. Plums are exported to a large extent, fresh and dried, also crushed and preserved in their own juice *pekmez* (marmalade). Excellent brandy "Slivovica" is made in a primitive manner from the surplus of plums and is highly esteemed in western Europe. A great area of southern Serbia is covered by vineyards producing delicious grapes, but Serbian wines have no quality on account of the very primitive method employed in this industry and they are for the most part exported to France for improvement whence they are re-exported over the world under the name of "Bordeaux." Flax and more especially hemp grow mostly in the central districts of Vranja and Vlasotinci and are acknowledged to be of the best quality known in the world. Tobacco of delicious flavor and aroma grows in Serbian Macedonia and the districts of Nish and Alexinac, but this industry is wholly monopolized by the government which makes the use of tobacco almost prohibitive.

Mining.—The mining industry in Serbia seems to be the oldest and the most developed, for there are archæologic remains in the mercury mines of Mount Avela, in the district of Belgrade, indicating that they have been worked from the Neolithic Age, and according to history silver mining constituted in the Middle Ages the principal source of wealth of the Nemanjichi's kingdom. As for gold there are remarkable formations in the diluvial and alluvial deposits of the rivers Timok and Pek, as also in the quartz veins and crystalline masses found in the department of Negotin and in the Majdanpek and Deli-Jovan. The Black River is famous for its alluvial washings, containing gold in trachytic rocks. But the most important of all Serbian ores are undoubtedly the unusually rich deposits of copper found in Bor, district of Pozharevatz, mostly in the shape of anticular masses of various pyrites but also, and especially at Majdanpek, in conjunction with iron sulphates, zinc and lead. Other important copper deposits have been found, and to some extent worked, in the mountains of Maljen, Povlen, Subovar and Vis. Lead ores are found in many parts in the valley of the Sava River (Podrinje), but none is of any great importance. However the Serbian government has built factories for smelting lead in the mountain of Krupanj. Zinc ores are frequent in Kuchajna and Rudnik, and nickel in connection with chrome oxide occurs in small quantities near the town of Kraljevo in the mountain of Suvobar. The most important mines of brown coal are those at Senje, and coal-beds of the Tertiary period and Tertiary lignite are to be found almost everywhere along the rivers Drina, Sava and Morava. There are several mines of liasic coal, mixed with sandy clay, at Dobra, Zajechar and along the river Timok, but the working of them is wholly inadequate and primitive. The quarrying industry (granite, lithographic stone, millstone and marble), and mineral waters is very sadly neg-

lected despite the most liberal concessions which the government grants to those who wish to exploit them.

Commerce and Industries.—As Serbia is pre-eminently an agricultural and cattle-breeding country the principal articles of exportation are cereals of all description, fruit (fresh and dried), cattle, sheep, wool, pigs and products thereof, wax, honey, and certain domestic dyes. But the foreign commerce in Serbia has been greatly hindered by the insufficient mileage of railways, navigable rivers and other ways of communication; most especially has Serbian commerce suffered on account of the absence of an outlet to the sea. Under the new régime Serbia enjoys the great advantage of seaports. Austria-Hungary was the natural consumer of Serbian products, but that powerful monarchy at all times exercised a rigorous policy toward Serbia, limiting the number of heads of Serbian cattle and pigs to a small minimum and subjecting the same to most vexing regulations, which led directly at first to the Tariff War in 1905 and then to the European War of 1914. The principal articles of importation into Serbia are paper and paper products, colonial ware, metallic products, clothes, glass and china, and machinery of all description. Before the outbreak of the European War Serbia had concluded treaties of commerce with all the most important countries, granting to the United States of America the clause of the most favored nation. Besides their agricultural and pastoral pursuits the Serbian population busy themselves with the manufacture of raw materials and some domestic industries, which are not only primitive but show a marked decadence. This is chiefly due to the apparent superiority and comparatively low prices of imported products over those made by the peasants themselves. Women work the wool, the hemp and the flax from which they make, with an admixture of cotton not only linen for shirts and underwear but even the cloth for outer clothing of both men and women of the family, while men—and especially those who have no large landed property—show great mechanical skill in shoe-making, for industry and other most elementary handicrafts. Much more could be said of the textile industry which is developed to a considerably high degree and which has earned a world-wide reputation for the Serbian rugs (manufactured chiefly in Pirot) woven on hand looms by women. Those rugs are much sought for on account of their solid workmanship, their original domestic designs and, most especially, their bright and permanent, natural coloring. But the most successful industry is flour-milling, which has been developed considerably owing to the natural advantage of water power and to the fact that the duty imposed by the late Dual-monarchy of Austria-Hungary on Serbian cereals was so high that the peasantry were forced to export them in the form of flour. The brewing industry is also prosperous in Serbia for it supplies almost the entire home consumption, but beer is not by any means a popular or widespread drink among Serbian peasants. Sugar refining, manufacture of cheese, meat-packing, and, to some extent, timber and metal industry constitute almost the entire employment of the land. With the exception of a few factories on the banks of the

Danube and the Save, there are only small factories in the interior of Serbia; among those mention should be made of that at Vranjska Banja for treatment of hemp, at Leskovatz and Parachin for textiles. But on the whole industries in Serbia are only in their infancy, and the government realizing the great advantages which domestic industries bring to a country, is always prepared and even eager to grant most liberal concessions to persons, whether Serbian or foreign citizens, desiring to establish a new industry. The government grants to such enterprises not only free land necessary for the construction of factories and lodgings for workmen, but even exempts them from paying any custom duties on machinery, raw materials, and half-wrought articles of which they may have need in such factories. Furthermore the government sells to such industrials coal at the cost price and reduces the railway rates by 25 per cent from the fixed tariff.

Education and Religion.—Illiteracy in Serbia is very high, there being only about 20 per cent of the entire population who can read and write. Elementary schools are now to be met with it in nearly every little village and primary education is free and compulsory. In larger towns there are "gymnasias" (*Real* and *classic*) corresponding somewhat to the American high schools. In Belgrade there is a university with faculties of philosophy, law and engineering, a military academy, a state academy of commerce and a theological seminary. All these schools are entirely maintained by the state, and there are very few private educational institutions. The Royal Serbian Academy of Science publishes and rewards the works of deserving writers, scientists and artists, and spreads knowledge all over the country by means of its excellent periodical *Glas Akedemije Nauka*. Prior to the 7th century the Serbians, and indeed all the Southern Slavs, were pagans, but there is only a slender material available concerning their worship of nature. Soon after the Serbian immigration into the Balkan Peninsula, during the 7th and 8th centuries, Christianity which was already deeply rooted with the Byzantines, easily destroyed the ancient faith, not, however, without great struggle. Owing to the absence of competent interpreters of the Christian faith, and to the unintelligible manner and language in which it was enforced, as it were, on the population, great numbers of survivors of paganism remained in the Serbian provinces; most especially around the river Neretva. In the course of some thousand years Greco-Oriental myths and legends, ancient Illyrian and Roman propaganda and Christian legends and apocryphal writings, exercised so great an influence upon the ancient religion of the people that it is impossible to unravel from the tangled skein of such evidence as is available a purely Southern-Slavonic mythology, and throughout the Middle Ages, nay even to this day, the ancient worship of popular pagan divinities has persisted.

According to Constantine Porphyrogenitus the Serbians adopted the Christian faith at two different periods, first during the reign of the Emperor Heraclius, who had requested the Pope to send a number of priests to convert those peoples to the Christian faith. Yet the

Dalmatian Serbs remained pagans as late as the reign of Pope John IV (640-642). The Croats already belonged to the Roman Church at the time when its priests were converting the Serbs to Christianity between the years 642 and 731, i.e., after the death of Pope John IV and before Leon of Isauria had broken off his relations with Rome. The second conversion of those Serbs who remained pagans was effected about 879, by the Emperor Basil I. The Grand Zupan Stefan Nemanja overthrew that subjection, but the Pope again succeeded, after Nemanja's death, in imposing his hegemony, only to be definitely overthrown by Nemanja's son Stefan Prvovenchani. The first Serbian archbishop was Rastko (later Saint Sava), Nemanja's youngest son, who was crowned by the Royal Wreath which King Stefan Prvovenchani obtained from the Pontifex Maximus. But the great Serbian ruler, Emperor Dushan the Mighty, brought the Serbian Church to its apogee when he elevated (in 1346) the Serbian archbishopric to the degree of Patriarchate, an act which drew upon it an anathema from the ever-jealous Patriarchate of Constantinople. When the Serbian Empire was lost on the battlefield of Kosovo (1389), and subjugated by the Osmanli Turks, the Church became a centre of nationalism, and in the course of nearly five centuries of Ottoman dominion, planned the insurrection against the oppressors. But the dominion was unbearable, and Serbian patriarch Arsenije Crnojević fled to Austria-Hungary, together with 37,000 Serbs. His example was followed by one of his successors (1738) whose name was also Arsenije. In the beginning of the 19th century the Greek Phanariots associated themselves with the tyrannic Pachas in the Serbian lands and gave a mortal blow to the Serbian Patriarchate of Pech (Ipek) and abolished even the Serbian episcopal see. But Prince Milos Obrenovich of Serbia succeeded in restoring the autonomy of the Church, giving the entire rule to the archbishop of Belgrade, Melentius, with the title of Metropolitan of Serbia. The election of the Metropolitan, however, was subject to the approval of the Patriarch of Constantinople who was to receive also a tribute in money; and it was only in 1879 that the Serbian Church became entirely independent. The present state religion in Serbia and Montenegro is the Eastern-Orthodox, and it maintains a union with the Universal Eastern Church. Serbia is divided in eparchies, the eparchs being elected by the Council of Bishops, which has the highest ecclesiastical authority. There are the High Ecclesiastic Judicial Court, the diocesan ecclesiastic courts, the department arch-priests and the deans of districts, and the parish priests. Public worship by other denomination (Catholics, Protestants, Jews and Mohammedans) is allowed in Serbia by the law, but the authorities of all religions are placed under the control of the Minister of Public Instruction and Public Worship.

Finance.—The principal revenues are derived from direct and indirect taxes imposed on every citizen and owner of property, customs duties, excise, state monopolies of salt, sugar, tobacco, matches and petroleum. Prior to the Treaty of Berlin, Serbia had practically no debts but the construction of the International railway from Ostend to Constantinople forced

Serbia to construct her part and to enter into European financial markets and to conclude, in a rapid succession, the following loans: (1) Russian loan (\$1,200,000); (2) Lottery Loan of 1881 (2 per cent) \$4,945,000; (3) Loan from the Serbian State Mortgage Bank (5 per cent) \$1,455,000; (4) Primary loan of 1888, \$1,835,000; (5) Unified loan of 1895 (4 per cent) \$67,580,000; (6) Railway loan of 1899 (5 per cent) \$960,000; (7) Monopoly loan of 1902 (5 per cent) \$2,300,000; (8) State loan of 1906 (4½ per cent) \$18,835,000. The war loans of 1912-18 are yet unknown but they certainly exceed \$1,000,000,000. The State Budget in recent years has exceeded annually \$60,000,000 one-third of which is generally expended by the war office.

Railroads and Transportation.—Railways in Serbia have a total length of about 1,000 miles consisting of the following lines: (1) Belgrade-Nish; (2) Belgrade-Semendria; (3) Nish-Vranja-Risbovat-Uskub-Gjevgeli; (4) Stalat-Uritze; (5) Nish-Pirot-Tzaribrod; (6) Belgrade-Valjevo; (7) Nish-Knjazevatz; (8) Paratyin-Zaietchar-Negotin; (9) Uskub-Mitrovitza; (10) Monastir-Greek frontier. Navigation on the Danube and the Save is of enormous importance in Serbian economic life. Apart from the steamships (about 15 in number) owned by the Serbian government and private companies, there are two foreign navigation companies, one Austrian and the other Russian. Roads and highways connecting principal towns in Serbia are fairly well constructed but the roads between smaller towns and villages are in very bad condition chiefly owing to the mountains and the rocky nature of the soil. The rivers Morava and Vardar, which traverse the country, are navigable only for very small boats.

History.—The region inhabited at present by the Serbian race (Serbia proper, Montenegro, Bosnia, Herzegovina, Dalmatia, Croatia, Slavonia, Istria, Backka, Banat, Syrmia (Srem), the Sandjak of Novi Bazaar and Macedonia, was originally populated mostly by Thracian and Illyrian tribes, and ruled at first by Macedonia, then, during the 1st century, by the Romans. In this fertile and picturesque country flourishing towns sprang up on the banks of the Danube (*Singidunum*, to-day *Belgrade*) and the Morava (*Naessus-Nish*), but during the following centuries, lying as it does close to the great highway through Europe, it was overrun in succession by the Huns, East Goths and Langobards, and brought, about A.D. 550, under the sway of the Byzantine Emperor Justinian, only to be torn from his successors by the Avars, who again laid it waste. It was at the beginning of the 7th century that the Serbs descended from the Carpathian slopes to the shores of the Black Sea, thence moved westward along the northern bank of the Danube, and, crossing the river, settled mostly in the same territories which they inhabit at the present time. Under what circumstances and under what leaders they effected their migration is unknown, but the ancient inhabitants of these regions (Latins, Illyrians, Thracians, Greeks, and the Pelasgs) seem to have been easily driven toward the Adriatic Coast. Their emperor, Heraclius (610-641), unable to oppose an effective resistance, ceded to the Serbs all the provinces which they had occupied and peace

was thus purchased. The pagan and uncultured Serbians came now into constant intercourse with the civilized Byzantines, and soon (from 7th to 9th century) were converted to Christianity, especially by the so-called Slav apostles Cyrillos and Methodius, who translated the teaching of Christ into the ancient Slavonic language. As the Serbians during the 7th and 8th centuries were divided into many tribes, they became, despite their warlike character and innate bravery, an easy prey to the attacks of the Byzantines, the Fino-Bulgars and the Franks, but they never were subjugated by any of their aggressors. The Serbians, however, were forced to realize that only by centralization of their power could they offer resistance as a nation, and several efforts were made to found a state on the banks of the Morava, with Korea Margi (now called Chupriya) as its capital, in the early part of the 9th century, but owing to the hostility of the Bulgarians, this proved abortive. At about that time, Bosnia, which was one of the Serbian *Zhupanias* (county), severed her relations with the other Serbians and formed an autonomous *banstro* (i.e., province, ruled by a *ban* or prince). Zupan (or Zhupan, count or prince) Vlastimir succeeded in emancipating his province from the Byzantine suzerainty and established an independent state called Rashka, extending around the rivers Piva, Tara and Lim, touching the basin of the river Ibar in the east and that of Vrbas in the West. But in the very beginning of their civil life there were dissensions among the leaders which facilitated the interference of the Bulgarian chieftain Simeon, who took into captivity a Serbian rebel Chaslav and supported him in his claims to the throne of Rashka. At about 931, however, Chaslav succeeded in wresting from his Bulgarian ally Simeon a new state which comprised, together with Rashka, the territories of Zetta (to-day Montenegro), Trebinje, Neretva and Hum. After his death great disorder reigned in the principality. In the course of the following century the Byzantine emperors, having again brought the now enfeebled Bulgaria within their rule, also overpowered Rashka, whose Grand Zhupan fled. The ruler of Zetta Zhupan Vojislav (1031-51) took the opportunity of declaring himself king of the Slavs (*rex Sclavorum*). He was acknowledged in that dignity by Pope Gregory VII in the year 1077. Under the rule of King Bodin, the son of Mihajlo, the Serbian of Chaslav was restored, and Bosnia was annexed. But after Bodin's death new disorder ensued, caused mainly by the dissensions among the several and ever malcontent pretenders to the throne. Despite all the unfortunate internecine strife, which has been the most fatal, and constant, feature of Serbian rulers of all times, the Grand Zhupan Stefan Nemanja (1169-96) defeated, in a deadly battle, his own three brothers, and then began an epoch of two centuries of complete independence for Serbia and a dynasty which covered the country with military glory. Nemanja succeeded not only in uniting under his sceptre all the provinces held by his predecessors, but also in annexing those (Ham, Scutari, Cattaro, etc.) which never had been Serbian before, and he placed Ben Kulin, an ally, upon the throne of Bosnia. Nemanja abdicated in favor of his

able son Stefan, and withdrew into monastic life, together with his youngest son Saint Sava. Stefan Nemanjich, who was the first crowned king of Serbia, had to struggle with his elder brother, Vukan, and with the Holy See. Vukan as the rightful heir to the throne antagonized his brother Stefan, using the influence of Hungary and the popes. When the Crusaders took Constantinople, Saint Sava, Nemanja's youngest son, succeeded in emancipating the Serbian Church from the influence of the Patriarchate of Constantinople, and obtained complete autonomy (1219), becoming himself the first Serbian archbishop. King Stefan Prvovenchani was succeeded by his worthless son Radoslav (1227-33), only to be dethroned by his brother Vladislav (1233-42), who was in no wise of any greater importance to the Serbian people, and who was removed from the throne by his third brother Urosh the Great (1242-76). This ruler wisely availed himself of the German miners who were ousted by the Tartar invaders of Hungary, and who developed to a high degree the exploitation of the Serbian mines (especially silver); thus the Serbian state became one of the wealthiest in Europe. But this prince was dethroned by his eldest son, Dragutin, after a bloody battle in Herzegovina, only to be himself ousted from the throne to a monastery by his brother Urosh II Milutin, whose reign (1281-1321) was marked by his conquest of Macedonia. He also reduced to obedience Shishman, a Tartar satrap of the Bulgarian province of Vidin. In the meantime Dragutin obtained from his mother-in-law, the Queen of Hungary, as fief, the lands between the rivers Danube, Save and Drina, and assumed the title of King of Sirmia, but he yielded the greater part of that territory and his title to his brother Milutin, while the remainder was left under the suzerainty of the kings of Hungary. After Milutin's death, the usual fatal discord arose concerning the succession to the throne. However, order was re-established by Milutin's son Stefan Dechanski, whose reign is remarkable for his glorious and complete victory over the Bulgarians in the memorable battle of Velbuzhd (Kustandil) 1331, in which the Bulgarian ruler was killed. In commemoration of that victory Stefan built the magnificent monastery of Dechani, from which he obtained his name "Dechanski." The whole of Bulgaria came under the sway of a Serbian king. Stefan Dechanski was dethroned, and, according to all appearances, strangled by his own son Dushan the Mighty (1331-55), under whose glorious rule Serbia reached the summit of power. He aimed to establish his sway over the entire Balkan Peninsula, for he had a curious presentment of the Ottoman invasion, and having overpowered nearly the whole of the Byzantine Empire, he proclaimed himself, in agreement with the *Vlastela* (Assembly of Great Nobles), Tsar of Serbia. Furthermore, that prince elevated the Serbian archbishopric to the dignity of the patriarchate and subdued the whole of Albania and Epirus as far as Janina. Thanks to the dissensions between Emperor John V. Paleologus and the notorious Prince Kantakuzen, Dushan succeeded in overpowering and annexing to his state the whole of Macedonia, with the exception of Salonica and Thessaly. In 1349 Ban Stefan Kutromanich of Bosnia pil-

laged Trebinje, but Tsar Dushan was unable to chastise that rebel on account of the threatening danger from the Turks, whom Kantakuzen had now brought over to forward his ambitions. Always conscious of the Turkish danger, Tsar Dushan espoused Princess Helen, the daughter of the newly-elected Bulgarian ruler John Strazimirovich, and started energetic negotiations for an alliance between Serbia, Bulgaria, Venice, Hungary and Pope Innocent; to the people he promised even to introduce the Catholic faith provided he were named the commander-in-chief of all the Christian armies in a crusade against the Turks. His sudden death, in December 1355, frustrated his ingenious plan and marked the beginning of the Serbian downfall. In the interior administration, Tsar Dushan's epoch is marked by the development of commerce and industry, construction of roads and highways, and most especially by his memorable "Zakonik" (code of laws) governing customs and ordinances of his predecessors and ratifying the privileges of the clergy and nobility. As Dushan's son, Urosh the Weak, was not of age at the time of his father's death, the rule of the country passed to one of the vassals of Macedonia, King Vukashin, who, together with his brother and other lords, held independently the whole territory adjoining Prizren to the south of the mountain in Sar. Profiting by the dissensions amongst the Serbian lords and the weak rule of Urosh (1356-67), the Byzantines rescued Macedonia while the Hungarians took back Belgrade. Soon Epirus, Acamania and Thessaly were lost, and governors of other provinces in rapid succession renounced obedience to the new king. In 1371 Emperor Urosh the Weak was killed while hunting (according to all likelihood by the hand of King Vukashin), and with him the dynasty of Nemanjics died out and Serbia virtually lost her independence. The haughty Vukashin proclaimed himself king, and in co-operation with his brothers, gathered an army of about 80,000 men to resist the already well-advanced Turkish invasion now threatening Serbia. His armies, however, although successful at first, were surprised on the night of 20 Sept. 1371, by the Turkish cavalry and annihilated on the banks of the Marica. Both King Vukashin and his brother perished in that disaster, and Prince (Kraljevic) Marko, the favorite hero of the Serbian National Poetry, proclaimed himself king of the Serbians, but the assembly of nobles, in their session at Pech (Ipek) in 1374, placed the crown of Serbia on the head of Lazar Hrebeljanovich, who assumed the modest title of *Kneh* (prince), and who subdued not only Prince Marko but also the other princes and barons. Furthermore, Prince Lazar caused the Patriarch of Constantinople to withdraw his anathema from the Serbian Church, and even to recognize the autonomy of the Serbian patriarchate, but Ban Turtko of Bosnia, who was a descendant of the Nemanjich dynasty, endeavored to uphold that tradition and crowned himself king of all Serbia in the Monastery Mileshevo. Prince Lazar, instead of declaring war on that ambitious prince, succeeded in making an alliance with him, and gathered an army of about 100,000 men with which he faced the forces of Sultan Murat (numbering over 300,000) but, partly because

one of the malcontents, Vuk Brankovich, betrayed his sovereign by misleading his 12,000 horsemen, and partly because the alliance with Ban Turtko proved abortive, the Serbian armies were utterly annihilated in the disastrous battle of Kossovo (15 June 1389). Prince Lazar was captured and beheaded, and Sultan Murat perished by the hand of a Serbian knight, Prince Milosh Obilich. That unfortunate disaster, although it did not crush the Serbian state, left upon the Serbian people a deep impression and a cycle of most beautiful epic poetry immortalized the event. (See SERBIAN LITERATURE—*Serbian National Poetry*). The tottering Serbian state came now under the sceptre of Lazar's son Stefan Lazarovich (1389-1427) who fought the Turks in several battles of minor importance, but, owing to overwhelming numbers of the enemy, was compelled to cede his realm to the victor. After his death he was succeeded by the grandson of Lazar's daughter Djuradj Brankovich (1427-57), but all his efforts to shake off the Ottoman dominion remained without avail. When Despot Djuradj died the nobles could not agree concerning his successor, and in the disorder that ensued the Turks completed their conquest of Serbia in 1459 and invaded Bosnia. The last Tomashevichs fled to Rome, and the flower of Serbian aristocracy which survived the Battle of Kossovo, took refuge in the Orthodox Courts in Wallachia and Moldavia, in Dalmatia and Hungary. Some of them fled even as far as Scotland and Ireland. The subjugation of Bosnia was an accomplished fact by 1453, and Herzegovina followed her fate in 1482. But the only orthodox Serbian state that never succumbed to the Turkish pashas was Montenegro (Zrna Gora), whose mountains, inaccessible to the Ottoman horsemen, became the nests of *Hajduks* and *Uskoks* (guerilla warriors), members of the Serbian high aristocracy. Albania, with her chieftain of Serbian descent, George Kastriotovich, surnamed Skandarbeg (1443-68), offered a stubborn resistance in a series of battles (see ALBANIA), but finally was subdued by the overwhelming foe. The cruel nature of Turkish rule soon forced thousands of Serbia's best families to emigrate and join their brothers in Southern Hungary (Bachka, Banat, Croatia and Syrmia). Those who remained were either forced to embrace Islam (which was especially the case in Bosnia), or to live as *raya* (slaves), for the Turkish *spahis* (landlords) confiscated the land hitherto belonging to the native nobles.

But when the *hajduks* and *uskoks* abandoned their original plan—that of exercising a check on occasional tyranny of certain haughty Turkish pashas and sparing and protecting the helpless Christian population, and made both highway robbery and murder their profession, the iron hand of the Turkish rule was bitterly felt, and with the beginning of the 17th century, especially after the wars between the Turkish and Austro-Hungarian empires in which the Serbian volunteers helped Austrian ambitions, an epoch of terror began on the part of the Turks, and cruelties of indescribable baseness became the regular occupation of the *Janisseries* and *Dahis* for, after the conclusion of the Treaty of Svishtov (1791) the Sublime Porte gave guarantee that the Serbian volun-

teers would not be punished for their uprising and four Dahies were murdered, the pacific vizer of Belgrade, the Mustafa Pasha, as well as more than a hundred popular and prominent Serbians. This they did for fear lest a fresh insurrection should be instigated by the leaders. There were some prominent Serbians who took refuge in the mountains, inaccessible to the Turkish horsemen, and elected George Petrovitch (or as the Turks called him Kara-George, i.e., Black George) as their leader. The rebellion was organized and started in January 1804. Under the leadership of this great strategist the Serbians fought successfully and recovered from the Dahies the entire Pashalik of Belgrade. However, the Turks profited by the engagement of Europe, and more especially of Russia, in the struggle with Napoleon, and sent large armies in three different directions which subdued the insurgents and subjugated the territories won by them. George Petrovitch and other leaders left the country to seek aid, first in Austria and later in Russia. In this absence Milosh Obrenovich, one of Kara-George's lieutenants, made a fresh attempt to liberate the Serbian people from the Ottoman yoke, and in 1815 was successful in re-establishing the autonomy of the Belgrade Pashalik. During the progress of his operations, George Petrovitch returned to Serbia, but was assassinated at Smederevo (Semendria) by order of Milosh, who then proclaimed himself hereditary prince of the occupied territory, and was approved as such by the Sublime Porte in October 1815. While very wise in home affairs, Milosh openly opposed Russian influence in Serbia and incurred the bitter hostility of that power, which forced him to abdicate in 1839 in favor of his son Mihajlo. This young prince was a very subtle diplomat, and rescued from the Turks, and annexed to his independent state several important Serbian towns. He was banished in 1842 and was succeeded by Alexander Karageorgevich (1842-60) son of Kara-George Petrovitch. Under the prudent, though meek, rule of that prince Serbia obtained a modern constitution, but an unfortunate foreign policy and the corruption of the Serbian statesmen forced him to abdicate the throne and leave the country. The Skupshchina (or national assembly) restored Milosh in 1860, but he died the same year. His son Mihailo succeeded (1860-68), but was assassinated at Topchider, near Belgrade. As Milan, the only heir, was not of age, a regency of three (Blaznavaz, Gavrilovich and Ristich) was appointed, and secured from the Porte an acknowledgment of the young prince as hereditary ruler. They framed (in 1869) a constitution measurably satisfactory to the conflicting political parties. When Milan attained his majority in 1872 he ascended the throne and soon precipitated a war against Turkey (1876-78) which resulted in the annexation to Serbia of a few new districts. The Treaty of Berlin acknowledged Serbian independence, and in 1882 the principality of Serbia was proclaimed a kingdom. The unfortunate war against Bulgaria in 1885, which was instigated by Austria and by which Milan hoped to prevent his neighbors from annexing East Rume-
lia, forced that haughty prince (in 1888) to grant a liberal constitution to his people in order to retrieve his lost position. However,

his unpopularity, aggravated by his enforced divorce from Queen Nathalie, made it necessary for him to abdicate in favor of his 12 years old son Alexander. During Alexander's minority the executive power was delegated to a regency under the leadership of Ristich. At the age of 16 Alexander deposed the Regency by a well-planned *coup d'état* (in 1893), and in the following year he abrogated the constitution of 1888 and restored that of 1869. In 1900 he married his former mistress, Draga Mashin, under whose influence he entered upon a period of tyranny almost Neronian in type, thus alienating his people and his friends and playing into the hands of his enemies who finally murdered him in 1903. The National Assembly (Skupstina) immediately elected to the throne Prince Peter Karageorgevitch son of Prince Alexander and grandson of Kara-George Petrovitch, who had spent a long life in exile and whose reign forms a most important epoch in Serbian history. Strictly constitutional, he gave *carte blanche* to his cabinet headed mostly by M. Nikola Pashitch, to whom Serbia was indebted for avoiding war with Austria on more than one occasion. With the growth of trade and industry, for which M. Pashitch established a new and solid basis, Serbia's position of complete economic dependence, on the openly hostile or extortionate markets of Austria-Hungary, became more and more impossible, for exportation to and importation from that monarchy began rapidly to diminish, and in order to obtain some relief from this thralldom Serbia concluded, in 1906, a customs treaty with Bulgaria. To this Austria replied by a war of tariffs, the so-called "Pig-War"; swine being one of the most important items of Serbia's export trade. The resulting economic crises, which, however, were soon overcome by new routes to Egypt, France and England, greatly embittered the peasantry against Austria-Hungary and indirectly led to a closer *reapproachment* with Russia. Still more hostile was the dual monarchy, when she clearly saw that her policy of impoverishing her neighbors and then crushing them, proved futile, for Serbia revised and concluded new treaties of commerce with almost all European countries and manifestly showed herself as a fully-grown member in the family of nations. Profiting by the disorder caused in Turkey by the young Turks, and bitterly opposed to the just aspirations to a union of the Southern Slavs (or Yugoslavs), Austria threw a bomb-shell among the European Powers, signatory of the Treaty of Berlin, in wanton violation of that "scrap of paper" by annexing Bosnia and Herzegovina, which provinces of the Ottoman Empire she had administered for the previous 30 years. Serbia was in no mood to acquiesce, for all the Yugoslav provinces, notably Bosnia and Herzegovina, were conscious of their fundamental unity of race, language and aspirations with the Serbians, and were looking to the free kingdom of Serbia to lead them all toward independence, as Piedmont had led the other Italian states in 1860. In July 1912, Serbia, Bulgaria, Montenegro and later Greece formed a league, known as the Balkan Alliance, and the respective governments delivered to the Porte an ultimatum embodying the demand that autonomy should be granted to the European provinces under Otto-

man rule. At the same time, on 30 Sept. 1912, they began to mobilize their forces, to which Turkey replied with similar measures. The Powers at once made an ineffectual attempt to intervene and urged patience on the Balkan Alliance, while a joint note was presented to Turkey inviting immediate discussion of reforms in Macedonia. But the Balkan Allies, having determined not to be played with any longer, pushed events beyond the control of diplomacy, and on 17 September Turkey declared war on the recalcitrants. The Serbian forces totalled 330,000 men and were divided into four armies. While the first three armies converged upon Skoplje (Uskub) the fourth army was detailed to clear the Turks out of the Sandjac of Novi Bazaar and to proceed to the assistance of Montenegro. The decisive battle of the entire campaign, in which the Ottoman forces were crushed, took place on the field of Kumanovo before Uskub. In Albania the Serbians and Montenegrins took Ljesh (Alessio) and Drach (Durazzo), and in Macedonia the Serbian troops were successful in every battle, notably in those for Prilip, the birthplace of Serbia's national hero Prince Marko, and Bitolj (Monastir), while the Bulgarians invested Adrianople which finally fell into the hands of the Allies, thanks to the powerful help of the Serbians (50,000 men and 120 siege guns) rendered beyond the stipulations of the treaty. The London Conference (1912-13), hard pressed by the Austro-German menace, erected a new political state (which had never in history existed as such) under the name of Albania. The Montenegrins were ordered by the Powers to quit Scutari and the Serbians to evacuate the dearly won ports on the Adriatic, being allowed only a commercial route to that sea. The results of the entire campaign exceeded all the expectations of the Allies. As the Bulgarians had promised in that treaty to help Serbia with 200,000 men in case Austria should attack her, and as that aid was not needed nor given, but, on the contrary, Serbia had helped Bulgaria to secure Adrianople and Thrace, and in order to preserve European peace from threatening Germany and Austria, Serbia had abandoned Albania and her absolutely indispensable ports on the Adriatic, the necessity for a revision of that treaty was strongly felt, Bulgaria, however, absolutely refused to entertain the suggestion, exacting from Serbia the abandonment of the southern part of Macedonia as far as Monastir and the lakes which had fallen to the Serbians, and insisted on forcibly occupying Salonica which was conquered by the Greeks. The Bulgarian government even refused to submit, in accordance with the third article of the Secret Appendix of the Serbo-Bulgarian Treaty of Alliance of 1912, the case for a final decision to Russia, and advanced secretly, and endeavored to surprise the Serbian armies on the night of 29 June. But the ingenious Serbian General Putnik utterly routed the Bulgarian forces in the memorable battle of Bregalniza. By the peace that was concluded at Bucharest, Serbia shared the Sandjak with Montenegro and retained Macedonia north of the Ochrida-Doiran line with the promise of a railway outlet on the Adriatic. Having settled the point in a broad and generous spirit, Serbia gladly hung up her sword and prepared for a period of

peace and recuperation of social and industrial advancement. On 28 June 1914, the Archduke Franz Ferdinand, heir to the Hapsburg throne, and his consort were murdered, under most mysterious circumstances, in the streets of Serajevo, the capital of Bosnia, by two fanatic malcontents who were natives of Bosnia and Austrian subjects. On 20 July the Austro-Hungarian Minister in Belgrade handed to the Minister for Foreign Affairs a note charging Serbia with fomenting a revolutionary propaganda within the territory of the Dual Monarchy. It was asserted that the Serajevo assassinations were planned, and the murderers equipped, in Belgrade. Among other demands the Austro-Hungarian government exacted from the Serbian government (paragraph 4) the removal from the army and civil service of a number of officers and officials guilty of anti-Austrian propaganda, whose names would be furnished by the Austrian government (paragraph 5); to accept the collaboration in Serbia of agents appointed by the Austro-Hungarian government, for the suppression of the subversive movement (paragraph 6); to institute a judicial inquiry into the crime of 28 June; this inquiry to be held in Serbian territory, Austro-Hungarian delegates to take part in this investigation, etc. The French and British Ambassadors and the Russian Chargé d'affaires expressed indignation at the form, contents and the time-limit (48 hours) of that note and declared it to be unacceptable by any sovereign state in the world. The Serbian government unreservedly accepted all the demands of Austria-Hungary, except paragraphs 5 and 6, and promised to revise those articles of the constitution which stood in the way of these demands, and declared its readiness to refer any disputed point either to the Hague Tribunal or to the Powers who had taken part in the settlement of the controversy concerning the annexation of Bosnia and Herzegovina. Refusing the Serbian answer, the Austro-Hungarian government declared war on Serbia on 28 July 1914, which was followed by a desultory bombardment of the defenseless city of Belgrade. In spite of the German ambassador's assurances that Russia, being unprepared, would remain passive, and that the war on Serbia would be a mere "punitive expedition" which would be ended before the Powers could intervene, Austria awoke to the startling fact that Russia was beginning to move, and on 31 July, Vienna consented to eliminate from the ultimatum those demands which involved the violation of the sovereignty of Serbia. It was too late. Germany, having jockeyed Austria into a position from which there was no escape, declared war on Russia the next day. The Serbian army was entirely unprepared for the new war, for little or none of the wastage in the Balkan wars had as yet been made good, and the orders placed abroad, chiefly in France, for cannon, rifles, munitions, clothing and stores, had not yet been filled; heavy guns, automobiles and flying machines were almost completely lacking. Not before 12 August did the Austro-Hungarian troops (80,000 men) make a definite invasion at Loznitza and Lesnitza, but Vojuoda Putnik met them in the Cer mountain and routed them at Belikamen. It was not to be expected that Austria would accept as definite the blow inflicted on her

military prestige at the battles of Belikamen and Jadar. Having made good their heavy losses the Austrians advanced again with a fresh army of 250 battalions of infantry and numerous guns, and took by surprise the Suvoroh mountain. Retreat on the part of the Serbians was imperative on account of the lack of ammunition. However when the long-expected munitions arrived, about 23 December, the Serbians rapidly retook the line Lazaravac-Valjaro-Uzice, and the enemy was hurled back across the Drina. Belgrade, which had been evacuated by the Serbians, soon fell a victim to the violent artillery of the Serbian attacks from the surrounding hills. The pontoon-bridges having been subject to a fierce fire from the Serbian heavy guns the Austrian débâcle was complete. They left behind in Serbia 40,000 prisoners and hundreds of guns, with the transports and stores of a vast army. Almost the entire year that ensued passed in a comparative quietness that gave the Serbians time to rest and recuperate. But in July 1915 Bulgaria signed a secret treaty of alliance with Austria-Hungary and renewed those concluded in 1908. This gave hopes to the Austrians, and aided by several Prussian and Bavarian divisions, they attacked Serbia in October 1915 from the north and the Bulgarians attacked from the south. Against these odds the Serbians fought desperately, but finally were forced to retreat through Albania, which they found as hostile as their own ally Greece. This retreat constitutes the summit of human endurance and the saddest page in Serbian history. The few remnants of the Serbian army, and the great mass of the non-combatant population, found a refuge in Corfu, Italy and in southern France. The mysterious surrender of Montenegro and the escape of King Nikola to France and his son Prince Mirko to Vienna aggravated the national cataclysm of the Serbian people. See War, EUROPEAN.

An agreement was reached at Geneva, 7 Nov. 1918, by the Serbian Prime Minister and delegates to the National Council at Agram as the governing body of the Serbs, Croats and Slovenes. Under this agreement the Jugo-Slavs of the former empire of Austria-Hungary became incorporated with Serbia and sought recognition from the Entente Powers of the Agram National Council as the *de facto* and *de jure* government of the new Jugo-Slav state. The government of the new state is republican in form, with Joseph Pogaonik as first President. By 21 December the terms of union between Serbia and her sister Slovak states were agreed upon and a ministry representing them all was formed.

Government.—After the catastrophe of 15 June 1903 in which the last member (Alexander) of the Obrenovitch dynasty perished, the constitution of 1888 was restored. By that constitution the legislative power is shared by the king (the dynasty of Karageorgevitch) and the Skupshtina (or National Assembly), while the executive authority is in the hands of the Council of Ministers (eight in number) appointed by the sovereign. The Skupshtina, too, can force the Cabinet to resign as soon as it cannot command the confidence of the national representatives. The members of the Skupshtina are elected by *scrutin de liste* by entire counties (i.e., departments), the number

of which varies (from 4 to 12) according to the population of each department. The deputies are inviolable and irresponsible during their term of office, before the courts for whatever they say in the Skupshtina. All Serbians who are of age and pay direct taxes are eligible, but each department must have at least two candidates, apart from the general conditions and requisites prescribed by the constitution, who must possess a university degree or its equivalent in order to assure the representation of the educated classes, for nine-tenths of the Serbian population are illiterate peasants. The Skupshtina consists of only one chamber, whose deputies are elected almost by universal suffrage as the voting right is granted to all Serbians who are 21 years of age and who pay 15 dinars (about \$5) yearly in direct taxes. The deputies have the right to impeach ministers of the state and possess the sovereign right of controlling the budget. Although the sovereign has the right of convoking the Skupshtina in ordinary or extraordinary session, of closing and proroguing the sessions and of dissolving the Assembly, he cannot paralyze its work or exercise a determining power over the course of state affairs, for the constitution expressly ordains that the Skupshtina shall be convoked in ordinary sessions each year which cannot be closed before the budget for the following year has been voted. The constitution provides also for a Council of State (Senate with 12 members) which is the highest administrative body, passing resolutions in judgments between the state authorities and the autonomous authorities, exercising supreme supervision over the carrying out of the various electoral functions, and its advice must be taken upon all projects of law (bills) which are to be presented to the Skupshtina. The members of the Council of State are irremovable and independent, and six of their number are elected by the Skupshtina from a list of candidates presented by the king, and the remainder are appointed by the king from a list of candidates drawn up by the Skupshtina. Besides the ordinary Skupshtina there exists the Great Skupshtina which is convoked only on very important occasions, such as election of the new sovereign or establishment of succession to the throne, amendments of the constitution, cession or exchange of the territories of the state; or it can be called even by the king himself if he deems consultation imperative. Serbia is divided into departments (*okruzi*), arrondissements (*srezovi*) and communes (*opshtine*). The governor of the department is the representative of the central power. Justice is rendered by the courts of the communes, courts of the departments, the court of appeals and the Supreme Court or the Court of Cassation.

Army.—In accordance with the Law for the Organization of the Army, voted by the National Skupshtina in 1901, compulsory service in the army is general for all able-bodied men; those who are unfit for military service must pay 30 per cent additional indirect taxes. The military forces are divided into the national army and the home defense, the former beginning at the age of 21 and ending at 45 inclusive and consisting of three categories, while the latter lasts from 17 years to 21 and from 45 to 50. The terms of service in the standing army are

two years in the cavalry and artillery and 18 months in all other arms. For the educated classes there exists a shorter term of six months, provided the candidate passes successfully the examination qualifying him for the rank of sub-lieutenant in the reserve. Those who fail at the examination must serve 14 months. The enrolment of recruits takes place every year in July and August. The minimum height of the recruits is 150 centimetres and chest 78 centimetres (60 and 32 inches respectively). Previous to the Balkan wars of 1912 and 1913 (since which Serbia has doubled her territory and population) the standing army consisted of five divisions of infantry; one division of cavalry of four cavalry regiments, each of four squadrons and two-horse batteries; one fortress artillery team of two battalions; one regiment of mountain artillery of seven batteries; one command of engineers and one battalion of pioneers; two companies of cantoneers; one company of railway men; one company of telegraph men; one company of miners; and the royal guard consisting of one squadron of cavalry and one company of infantry. In the Balkan War of 1912 the entire Serbian army numbered 350,000, but in 1914 its strength was estimated between four and five hundred thousand. At Belgrade there is a very high class military academy for the training of officers, and at Kragujevatz there is an artillery school for non-commissioned officers. The standard of military education can be compared favorably with that of any first-class military power in Europe.

Political Divisions and Population.—The departments of Serbia, with their areas and populations, are as follows:

DEPARTMENT	Area in square miles	Population 1910
Old Territory		
Belgrade.....	782	155,815
Valjevo.....	949	157,648
Vranje.....	1,676	252,937
Kragujevatz.....	886	189,025
Krayina.....	1,123	112,142
Kruzhévatz.....	1,046	167,371
Morava.....	1,120	203,638
Nish.....	988	198,768
Pirot.....	934	112,314
Podrinje.....	1,371	238,275
Pozarevatz.....	1,605	259,906
Rudnik.....	606	85,340
Smederevo.....	493	143,216
Timok.....	1,234	149,538
Toplitza.....	1,096	110,218
Ujitze.....	1,270	146,763
Chachak.....	1,466	138,911
Belgrade City.....	5	89,876
Total (Old Territory).....	18,650	2,911,701
New Territory		
Novi Bazar.....		133,401
Pristina.....		239,386
Pljeolja.....		62,601
Kumanovo.....		166,939
Skolpje.....		153,293
Debar.....		82,476
Kavadar.....		97,763

Stup.....		67,575
Total (New Territory).....	15,241	1,703,866

The area of Serbia is therefore 33,891 square miles, with a population of 4,615,567, of whom 2,911,701 inhabit Old Serbia and 1,703,866 New Serbia. In Old Serbia, 1910, 2,528,819

were rural dwellers and 382,882 were urban dwellers, 2,890,602 were Serbian citizens and 21,086 were foreigners, comprising 6,060 Turks, 6,605 subjects of Austria and 5,518 Hungarians. Serbian was the language of 2,778,706 and 32,556 could speak Serbian and Rumanian, while a few thousands spoke German, Albanian, Hungarian, Greek, Turkish, etc. In 1900, over 2,000,000 were dependent on agriculture, 166,599 on industries, 109,998 on commerce, 116,566 on public offices and the liberal professions, and 6,440 on primary production other than agriculture. Of the Jews, 2,636 spoke Serbian or other Slav language; 1,544 Spanish, 462 German, 40 Hungarian and 1,047 spoke other languages. Of the gipsies, 27,846 spoke Serbian, 4,709 Rumanian, 181 Turkish and 13,412 Gipsy. Less than 20 per cent of the population are able to read and write. Belgrade is the most populous centre with 90,890 inhabitants. Other important cities are: Nish, with a population of 24,949; Kragujevatz, with 18,452; Leskovatz, 14,266; Pozarevatz, 13,411; Vranje, 11,439; Pirot, 10,737. In the new territories are the cities of Monastir (Bitobj), with 59,856 inhabitants; Uskub (Skoplje), 47,384; Prizren, with 21,244; and Novi Bazar, with 13,434 inhabitants.

W. M. PETROVITCH,

Chief of the Slavonic Division, New York Public Library.

SERBIAN LANGUAGE. The Serbian is the principal of all the South Slavonic (Jugoslavonic) languages. With the Croatian and the Slovenian, which are mere dialects of the Serbian, the Serbian language belongs to the Southwestern Slavonic group characterized by its pronounced softness which is affected by the abundance of vowels and pleasant hissings,

linguals, and dentals. The Serbians use the Cyrillic alphabet reformed by Vuk-Stefanovich-Karadjich and reduced to 30 letters for the 30 sounds, thus making the language ideally phonetic. Vuk's golden rule is "Write as you speak and read as it is written." The Croats and Slovenians use the Latin alphabet with the aid of certain diacritic signs. The tonic accent falls always on the first syllable in bisyllabic words, but there is no rule for polysyllabic words. There is no definite or indefinite article. There are three genders (masculine, feminine and neuter); two numbers (singular and plural); the ancient Slavonic *dual* has been preserved only in *oči* (*ocki*, eyes) and *uši* (*ushi*, ears). Substantives are divided in five principal declensions with seven cases. The Serbian is very rich in tenses of verbs, and compound tenses of all verbs, transitive and intransitive, are made by means of the auxiliary *biti*, to be. But the wealth of verbs in Serbian consists chiefly of the various aspects of one and the same verb. These are (1) *imperative aspect*, denoting an action or state which is being performed before our eyes and lasts indefinitely, e.g., *lupati*, to knock; (2) *perfective aspect*, indicating an action which is performed at the moment when we speak or which will soon be ended, e.g., *lupiti*, to knock once for all. (This aspect is subdivided into (a) *inchoative*, indicating an action as fully begun without intimating that it has been or will be ended, e.g., *pevati*, to sing, *inchoative*, *zapevati*, to begin to sing; or from *plakati*, to weep, *inchoative*, *zaplakati* to burst in tears; (b) *terminative*, denoting an action which is terminated and after a substantial lapse of time, e.g., from *pevati* to sing, *terminative*; *odpevati*, to finish singing); (3) *semelfactive aspect* denoting that an action is being performed but will last only for a second or will be performed but once and may happen again only to last for another second, and so on, e.g. *lupnuti*, to knock once; (4) *iterative aspect* denoting an action which has been or is being performed more than once, i.e., in repeated customary efforts, e.g., *lupkarati*, to keep on knocking, to persist, to persevere knocking. There are three principal dialects: *štokavski* used by the Serbians, *čakavski* used by the Croats, and *kajkavski* used by the Slovenians, deriving their appellations from the manner in which the word "what" (*što ča, kaj*) is pronounced. The *štokavski* dialect, according to Djuro Danichich and Jagich, is only the later phase of the *čakavski*, while the *kajkavski* is in a phase transitory from the Slovenian to the Croatian. Among the oldest and most characteristic monuments of the Serbian language are 'The Record of the Commercial Convention' concluded between Ban Kulin of Bosnia and a Ragusan ambassador in 1189; the 'Code (Zakonik) of the Emperor Dushan the Mighty' (1349); Stoyan Novakovich's 'Chrestomathy of Literature and Language of the Serbian and Ancient-Serbian' (Belgrade 1877).

W. M. PETROVITCH.

SERBIAN LITERATURE. The ancient history of Serbian literature, written in the old church Slavonic language and developed from the ecclesiastic books by the so-called Slav apostles Saint Cyril and his brother Methodius, comprises the epoch from the 9th century to the end of the 14th. The principal

monuments are: the manuscripts of the Miroslav Gospel from the middle of the 12th century, the Vukan Gospel beginning 13th century, the Nikol Gospel, end 14th century. The semi-ecclesiastical and the non-ecclesiastical books are written in a language slightly different from that of Saint Cyril and bear the impress of a powerful influence from Byzantium. There would belong the stories of 'Alexander of Macedonia,' 'The Trojan War,' as also some apocryphal and Bogomil writings. But of vastly greater importance for Serbian national history are the numerous lives and genealogies of the ruling princes and high church dignitaries, amongst which the 'Life of Stefan Nemanja,' written by his sons Stefan the First-Crowned King (13th century), Saint Sava and the latter's disciple Domentian, and the 'Life of Despot Stefan' (14th century) by Konstantin the 'Philosopher,' are undoubtedly the most noteworthy. The 'Duishanov Zakonik' (i.e., the Code of Emperor Dušan the Mighty) is an invaluable monument of Serbian mediæval jurisprudence, and has served as a model to the legislators of other Slavonic nations. The great calamity which befell the Serbian Empire in the year 1389, at the Battle of Kosovo, interrupted the free course of Serbian literature, and the prosperous republic of Dubrovnik (Ragusa) became the focus of science and art. Some enthusiastic literary historians call that epoch "Serbian Classic" or "Golden Age," but in true essence the Ragusan literature, although written in a comparatively pure Serbo-Croatian language, and more accessible to the masses of the people, is but a mere shadow of the Italian models. The earliest Ragusan poets sang partly in Latin and partly in Serbian or Italian (Marko Marulic, 1450-1528; Jerolim or Jeronim Papalic; Sisko Mencetic Vlahovic). More distinctly Serbian in type is Gjore (or Gjordje) Drzic whose short poem, 'Zaludnje Muke' (Vain Pains) is a superb specimen of false emotion in imitation of the Humanists. Hannibal Lucic with his drama 'Robinja' (Woman Slave) offers the first play of a period, or epochal character in Serbian literature; Stjepo Gučetić (1490-1550) with his satire *Derviš* (dervish); Andrea Cubranovic (1500-50) with his humorous and delightful poem *Jedjapka* (a Gypsy-Girl); Petar Hektorovic (1550-57) with his *Ribanje* (Fishing); Nikola Naljeskovic, Marin Drzic, Dinko Ranjina and Dinko Zlatarić mark a decisive effort to emancipate Serbian literature from Italian influence as they looked to the national life, customs and traditions for their subject matter and inspiration and manifest sincere emotions, at times almost epic in type. But the prince-poet of the Serbian literature in Dalmatia is Dživo (or Jovan) Gundulić (1588-1638) whose masterpiece 'Osman,' a long and impressive epic poem, glorifying now with virtuosity now with real poetic art, the long struggle of the Christians with the Ottoman Mohammedans (most especially the battle of 1621 between the Poles and Sultan Osman), and celebrating after the manner of a national minstrel, the triumph of the Cross over the Crescent, will remain forever one of the noblest proofs of Serbian poetic genius, and may be justly called the "Jerusalem Redeemed" of the South-Slav world. However the epic element in 'Osman' is subordinate to the chain of lyric

songs which constitute the greater part of the poem and which are of an incomparable beauty. Gundulić is pre-eminently a lyric poet, lacking in true emotion but excelling in the dramatic-idyllic field. His 'Ljubovnik Sramezljev' (A Shy Lover) is a free transversification of Gisolamo Preti's, and very characteristic of the epoch. Džono Palmotic (1606-57) exceeds all his contemporaries in dramatic art with a romantic tendency for painting at once the good and evil, the sublime and the grotesque in man. Djivo Bunic Vucicevic, author of some charming erotic songs full of genuine feeling, forms a contrast to his contemporary, Gundulić. Ingjat Djordjić (1657-1737) is the last of the chain of pseudo-classical Dalmatian writers. As a link between Dalmatian literature and the new literature of the Austrian Serbs of the senseless "Slavjano Serbskaja Skola" (Slavo-Serbian School), came Andrea Kacic-Mosic with his 'Razgovor' and his worthy attempts to collect Serbian national heroic ballads. The Slavo-Serbian School has furnished many a gifted writer, among whom Joakim Vuic, with his 'Travels Through Serbia,' Lukian Mnsicki, and more especially Jovan Raic, with his remarkable 'History of the Various Slav Peoples and particularly of the Bulgarians, Croats and Serbians,' stand high in literary history, for they paved the way to a new literary renaissance. Of great importance for the development of the people at large was the literary and educational activity of Bositej Obradović (1731-1811), for he was the first who dealt a mortal blow to the literary jargon of the Slavo-Serbian school with his numerous and eagerly read works, among which his 'Autobiography' and his translations and personal interpretations of 'Esop's Fables' are masterpieces in modern Serbian literature. But the gigantic work of a Serbian villager, Vuk Stefanović-Karadžić, (1787-1864), forms an important epoch in the history of Serbian thought. Amidst a violent cohort of fierce antagonists, who represented all that was literary and learned amongst a patriarchal people, Vuk stood and fought bravely for 50 years, collecting zealously from the lips of the national bards the spirited ballads and hero tales, of which he published the first volume in 1814. The work was acclaimed by the entire literary world and partly translated into German by Goethe and the brothers Grimm. From those national poems he compiled a 'Dictionary,' interpreted by German and Latin equivalents (2d enlarged ed., Vienna 1851; 3d prepared by P. Djordjevic and L. Stojanovic, Belgrade 1898) which could be compared favorably to Dr. Samuel Johnson's work, with the difference that Vuk drew all his examples and citations from the lips of the people, ignoring the works of the literary and learned classes. His numerous enemies at length opened wide their arms to Vuk, for he had a whole people standing by him, and his work definitely established the spoken Serbian language as a literary means. His ingenious alphabet consists of 30 letters for the 30 sounds of the Serbian language, and there are no diphthongs or double consonants. The golden rule: "Write as you speak and speak as you write" found good expression in his grammar, which Jakob Grimm translated into German. In 1823 Vuk published at Leipzig three volumes of Serbian national poems, which

were translated into German by Talvj (2d ed., Leipzig 1853) and into English by Sir John Bowring (London 1827). His other writings brought to light the inexhaustible treasures of the Serbian national customs, proverbs, anecdotes, enigmas, charades, etc., with which even his remarkable dictionary abounds. In his work he was powerfully aided by the ruling prince of Serbia, Milos Obrenovic, by Kopitar and the famous Serbian philologist Djuro Danicic. Around Vuk in Vienna there formed a circle of young Serbian poets, among whom Branko Radicevic (1824-63) with his lyric poems, occupies the highest place among modern Serbian lyric poets. Sima Milutinovic "Sarajlija" essayed himself unsuccessfully in the epic field with his 'Srbijanka,' eagerly read in its time but wholly forgotten now before the exuberance of the heroic poetry of the entire national genius such as collected by Vuk. Sarajlija's greatest merit, however, is Prince-Bishop Petar II Petrovic of Njegos (1814-51), whom he trained in the *ars poetica*, and whose supreme dramatic poem 'Gorski Vijenac' (The Mountain Wreath), full of philosophic reflections, in a beautiful blank decasyllabic verse, stands alone in the entire history of Serbian artistic poetry. More of virtuosity in versification than real poetry is to be found in the unduly popular Zmaj Jovan Jovanovic as opposed to the gifted and fervent poet of mad-scarlet style, Djura Jaksic. To characterize the two one might say that the former is unreadable and the latter is unread. Of the more modern and contemporary poets mention must be made of Lazar Kostic and Jovan Ducic. King Nickolas Petrovic of Montenegro deserves a high place with his national anthem 'Onamo onamo' ('Thither, Thither') and his drama 'The Empress of the Balkans' (English adaptation by W. M. Petrovic and D. J. Volnay, London 1913). Among the modern novelists and short story writers prominently appear Stjepan Mitrow Ljubisa, Adamov, Sabcanin, Janko Veselinovic, Sima Matavulj and especially Lazar K. Lazarovic, whose short stories 'When Father took me first to Matins,' 'The People Will Gild All,' etc., contain Shakespearean dialogues, and have earned a world-wide fame. In the historic-philosophic field Djuro Danicic and his worthy student, Stojan Noyakovic occupy a very high place, as does also Josif Pancic in the domain of natural science. Bogdan Poporic and his disciple, Jovan Skerlic are as subtle literary critics as are respectively Oscar Wilde and Walter Pater. Branislav Petronijevic, with his metaphysical writings, proved himself a worthy student of Professor Wundt. In the course of the latter part of the 19th and during the first decade of the 20th century many noteworthy literary and scientific magazines have been appearing, among which the *Otadžcina*, *Delo*, *Ozao*, *Godisnjak*, *Srpska Zora*, *Nada*, *Bosanska Vila*, *Letopis Matice Srpske*, *Glas Akademije Nanka*, *Knizevni Glasnik*, etc., compare favorably with the best publications of the kind in France, England and America.

W. M. PETROVITCH.

SERBIAN NATIONAL POETRY. Perhaps no people in the world possess such a wealth of national poetry as the Serbians. All Serbian national poetry is divided into two main groups:

the heroic songs (*junačke Pjesme*) which are sung, or recited, to the accompaniment of the *gusle*, by men only, and the lyric or women songs which are sung by both women and men. From time immemorial the Serbian has possessed an exceptional natural gift brought from his ancient abode in the north for composing heroic ballads; and the beautiful scenery of his new surroundings in the Balkan Peninsula and the contact with the civilized Byzantine influenced it so considerably that in some of those ballads one can find a marvelous union of rough force and virility of a naive and healthy people with all the splendor and picturesqueness of the ancient Hellenic pattern. The cycle of heroic songs about the disastrous Battle of Kossovo (1389) resemble the Homeric epic rather than any product of the genius of the northern Slavs. The most ancient cycle of ballads dwells on marvelous and mythological subjects, often exhibiting, like the Edda, notions about the creation of the world and some curious reminiscence of India as if to show that that land was the prehistoric abode of the ancient Slavs. The second cycle contains mostly songs of a religious character from the early Christian era, not without a mass of phantastic legends that were furnished by the apocryphal writings. The third cycle dwells on the events of the Turkish invasion and the struggle of the Cross against the Crescent. The fourth cycle, which is still in development, deals mostly with the wars and insurrections against the Turks and other oppressors. The *guslari* (national bards or minstrels or troubadours) used to go from one village to another, from one castle to another, chanting in an easy decasyllabic blank verse the exploits of Serbian heroes, the *hajduks* (robber-knights), and of the poems on great and national events. But by far the most popular are those which glorify the deeds of the wonderful and favorite national hero, Kraljević Marko (the Royal Prince Marko) and his horse Sarac. The exuberance of romance and the music of the language of those poems offer a majestic and strange contrast to the simplicity in which the *guslar* tells his story and the modesty of the musical instrument by which he accentuates his recitation. The heroic decasyllabic lines have invariably five trochees, with the fixed caesura after the second foot, and almost every line is in itself a complete sentence. The women-songs dwell mostly on Eros, but there are also many occasional songs which are sung at weddings, Christmas, Easter and numerous social gatherings (*moba*, *selo*, *prelo*, etc.). Many of those lyrics sing of birds and animals and even inanimate objects which are personified in the intense imagination of the woman poet. The vehement outburst of love and friendship manifest in some of those songs constitute a striking contrast to the hidden pain and slave-like tears with which others abound. The metre is most diverse, there being lines of from 4 to 16 syllables, but in those of 8 or more the caesura appears as a regular and constant repose. While the heroic verse, with the exception of accidental assonances, is blank, the rhyme of the lyric songs is very rich. Elision is most infrequent and inadmissible in Serbian verse; yet there are poets who in reciting, exceed all boldness. When Vuk Stefanovic Karadzio published in

Vienna (1814), his first collection of Serbian national poetry which contained in one volume 200 lyric and 23 heroic songs, Jacob Grimm, after having learned Serbian and translated into German a few of the poems, exclaimed, "The Serbian national poetry deserves indeed a general attention. . . . On account of these ballads I think the Serbian will now be universally studied." Seven years later Karadzic published at Leipzig a second edition in three volumes containing 406 lyric songs and 117 heroic ballads. It was from this edition that Sir John Browning made his metrical translation of a number of those poems which he published in 1827 in London under the title 'Serbian Popular Poetry.' The third edition of Karadzic's work appeared in Vienna at intervals between the years 1841 and 1866; it had now grown to five volumes. The Serbian government published later (1891) several collective editions in seven and nine volumes. Of the many attempts to render those poems in any of the foreign languages, besides that of Browning, the following deserve a special mention: von Talvj's 'Volkslieder der Serben' (in verse, Leipzig 1853); Dozon, A., 'L'Épopée Serbe' (in prose, Paris 1888).

Bibliography.—Kapper, S., 'Die Gesänge der Serben' (Leipzig 1858); Pypin, 'Istoriya Slavyanskikh Literatur' (Petrograd 1879); Karadzic, V. S., 'Srpske Narodne Pjesme' (Belgrade 1891); Stepović, 'Ocherki istorii serbohorvatskoy literaturi' (Kief 1899); Boskovic, S., 'Bacvanske Pesme' (Novi Sad 1863); Radicevic, 'Gusle Crnogorske' (Belgrade 1872); Filipovic, 'Kraljevic Marko u narodnih pesmah' (Zagreb 1880 and 1891); Hormann, 'Narodne Pjesme Muhamsdanaca u Bosni i Hercegovini' (Sarajevo 1880 and 1889).

W. M. PETROVITCH,

Chief of the Slavonic Division, New York Public Library.

SERENADE, properly, music performed in a clear night; hence a musical entertainment provided by a lover under the window of his mistress. It consists generally of instrumental music, but vocal is sometimes added. The practice existed even among the Greeks and Romans. Such music is sometimes performed merely as a mark of esteem and good-will toward distinguished persons, and then is not infrequently accompanied by long processions with torches. Hence the different character of serenades. A single singer may accompany his song with the guitar, mandolin, lute, etc.; or wind-instruments may be used, as flutes, horns, clarinets, hautboys; or, as is the fashion in some of the largest cities in northern Germany, many singers may join. Serenades are also sometimes used as concert-pieces, and then, of course, experience some change of character.

SERFS, the body of laborers, the working classes in general under the feudal system in Europe, and whose condition, though not exactly that of slaves, was little removed from it. Under this system, from the vassals of the king downward, the whole community was subject to certain degrees of servitude, and it was only on condition of specific services to be rendered to his superior that any individual held his fief. In the case of the lower classes this servitude amounted to an almost complete surrender of their personal liberty. There were two classes

of laborers, the villeins and the serfs proper. The former occupied a middle position between the serfs and the freemen. Hallam remarks, in reference to these two classes, that in England, at least from the reign of Henry II, one only, and that the inferior, existed; incapable of property and destitute of redress except against the most outrageous injuries. A serf could not be sold, but could be transferred along with the property to which he was attached. The revival of the custom of manumission counteracted the rapid increase of serfs. A serf could also obtain his freedom by purchase, or by residing for a year and a day in a borough, or by military service, or by dying. By these various means the serf population gradually decreased. In most parts of the Continent they had disappeared by the 15th century. The extinction of serfdom in England and Scotland was very gradual. As late as 1574 Elizabeth issued a commission of inquiry into the lands and goods of her bondsmen and bondswomen in specified counties in order to compound for their manumission; and even in the 18th century a species of serfdom existed among Scottish miners. Serfdom in Russia was abolished by a manifesto of Alexander II on 17 March 1861. Consult Page, T. W., 'End of Villainage in England' (New York 1900); Vinogradoff, Paul, 'Growth of the Manor' (New York 1911); Mavor, James, 'Economic History of Russia' (New York 1915). See **FEUDAL SYSTEM**.

SERGE, a kind of twilled worsted cloth, used for ladies' dresses, gentlemen's summer suits, etc. Navy serge is a thick durable make of this cloth.

SERGEANT, Army, an inferior or non-commissioned officer in a company of infantry appointed to see discipline observed, to teach the soldiers the exercise of their arms, and to order, straighten, and form ranks, files, etc. He also commands small bodies of men, as escorts and the like. He ranks next above the corporal, and is usually chosen from the steadiest of the corporals. There are four sergeants in a company, and of these the senior is called color-sergeant. Staff-sergeants are higher than these, and the highest sergeant of all is the sergeant-major.

SERGIPE, sēr-zhē'pě, or **SERGIPE-DEL-REY**, Brazil, a state on the Atlantic Coast; area, 15,090 square miles. The coast is flat and sandy; the interior consists of wooded hills. Streams in the populated eastern portion are numerous, but on the west are few. The chief river is the São Francisco; besides the Vasa-Barris or Irapiranza. The flora on the slopes of the Serra de Itabaiana is rich in valuable cabinet and dyewoods; iron-ore and crystal quartz occur. Although the soil is not very productive, sugar-cane, cacao, cotton, tobacco, corn, rice and flax are grown. On the Campos de Criação de Gados stock-raising is profitable. The industries include sugar refineries, distilleries, flour-mills and tanneries; shipbuilding on a small scale is carried on. Sugar and cotton are the principal exports. Capital, Aracajú. Pop. about 426,250.

SERGIUS, sēr'jī-ūs, the name of four popes, as follows:

SERGIUS, I: b. Syria, about 630; d. Rome 701. He succeeded Conon in 687. He opposed several provisions of the Quinisext Council of Constantinople in 692 and in consequence Justinian II sent to arrest him. Sergius, however, was protected by the exarch of Ravenna. He died in Rome after a pontificate of nearly 14 years.

SERGIUS II: b. Rome; d. 847. He succeeded Gregory IV in 844, and during his pontificate the Saracens from Africa ascended the Tiber, and plundered the environs of Rome.

SERGIUS III: d. 911. He was raised to the papal chair in 904, after the anti-pope Christopher had been expelled. On the strength of Luitprand's testimony, his character has been deeply calumniated. But contemporary chroniclers speak of him in the highest terms as a pious and enlightened pope. He restored the Lateran Church, and filled the Holy See nearly seven years.

SERGIUS IV: d. 1012. He succeeded John XIX, in 1009, and during his pontificate, and as a result of his exhortations, the Italian princes united to drive out the Saracens from the country. It was in his time also that the Normans began to enter Italy.

SERI (sā-rē') INDIANS (Opata, "spry"), an exceedingly primitive tribe of North American Indians, speaking a distinct language and living on Tiburon Island, in the Gulf of California, and the adjacent mainland of Sonora, Mexico. Although known since 1540, when some of Coronado's men visited them, almost nothing was known of their character, save that they were warlike and extremely conservative, until Dr. W. J. McGee led a small expedition among them, in the interests of science in 1894 and again in 1895. The Seris are unusually tall and well-built; they wear little clothing and subsist chiefly on turtles, water-fowl, fish and other food of the sea, eked out with the vegetal and animal products of the mainland desert. Their houses are flimsy bowers of cactus and shrubbery, sometimes rudely shingled with turtle shells and sponges. Bows and arrows are habitually used as weapons, harpoons of cane are employed for taking turtles, and unworked boulders or cobbles form a ready means for serving meat, crushing bones, mulling seeds, etc. They make graceful balsas of canes lashed together for use in navigating the strait between their island and the mainland; manufacture a very light pottery and some basketry. Shells are used for cups and to some extent for implements. The modern Seris are loosely organized in a number of maternal groups or clans, which are notable for the prominence given to mother-right in marriage and for some other customs. Polygamy prevails. These savages manifest an implacable hatred toward aliens, whether Caucasian or Indian, and the shedding of alien blood is regarded as their highest virtue. Two centuries ago the population of the tribe was estimated at several thousands, but it has been reduced by almost constant warfare, so that now it is barely 350. Consult McGee, 'The Seri Indians'; 17th Report of the Bureau of American Ethnology, Washington, D. C.

SERICULTURE. See SILK AND SILK INDUSTRY.

SERIES. A series is a succession of numbers or *terms*, usually proceeding according to some definite law. The law of the series may either define how a given term is derived from those that precede it, or it may define a term as a function of the number denoting the position which it occupies in the series. Thus, the series 1, 2, 3, 5, 8, 13, . . . is such that each term after the first two is obtained by adding together the two terms immediately preceding it, and the law of the series might be expressed by the formula $u_{n+1} = u_{n-1} + u_n$, in which u_{n-1} , u_n , u_{n+1} are any three consecutive terms. On the other hand, the series 1, $\frac{1}{2}$, $\frac{1}{4}$, . . . may be defined by the law that the n th term of the series is

$\frac{1}{2^{n-1}}$. Each term is then a function of the number n which determines its position in the series. One and the same series may frequently be defined in both ways. Thus, the series, 1, $\frac{1}{2}$, $\frac{1}{4}$, . . . is such that each term may be obtained from the preceding one by multiplying it by $\frac{1}{2}$. It may also

be defined by the formula $\frac{1}{2^{n-1}}$ as the expression for the n th term. A series is not uniquely determined when a number of its terms are given. In fact, an infinity of series may be found which include as terms any finite number of arbitrarily assigned numbers. In such a case the simplest law that can be found is naturally to be taken as *the law* of the series. Important use is made of this principle in the physical sciences. Series of numbers frequently arise in connection with experimental observations, which evidently proceed according to some definite law, and it is often of great interest to determine the nature of the law. Such series occur, for example, in the theory of spectrum analysis. Balmer's formula $c \frac{n^2}{n^2 - 4}$, in which c is a certain constant, determines, for different integer values of n , the wave-lengths of a long series of lines in the hydrogen spectrum. A variety of formulas have been obtained for other spectra. A very instructive account of the methods used in determining such series is given in Kayser's 'Handbuch der Spectroscopie,' Vol. II, pp. 503-573.

A series is said to be *finite* or *infinite* according as the number of its terms is limited or unlimited.

FINITE SERIES.

The law of the series being given, the most important problems relating to a finite series are the determination of the term occupying a given position and finding the sum of the series. The following cases are those of chief interest.

Arithmetic Series.—This series is $a, a + d, a + 2d, \dots, l$, so that the difference between any two consecutive terms is constant and equal to d . The n th term l is evidently obtained by adding d $n-1$ times to a and hence $l = a + (n-1)d$. If S denote the sum of the series, then $S = a + (a + d) + (a + 2d) + \dots + l$. By writing the terms in reverse order, the sum may also be expressed in the form

$S = l + (l - d) + (l - 2d) + \dots + a$. The addition of these two equations gives $2S = (a + l) + (a + l) + \dots$ to n terms, whence $S = \frac{1}{2}n(a + l) = \frac{1}{2}n[a + (n-1)d]$. In particular the sum of the first n integers 1, 2, 3, . . . , n is

$\frac{1}{2}n(n+1)$, and the sum of the odd integers 1, 3, 5, . . . , $2n-1$ is n^2 .

Higher Arithmetic Series.—The general expression $a + (n-1)d$ for the n th term of an arithmetic series is an integral function of the first degree in n . A more general series may be formed in which the expression for the n th term is an integral function of degree s in the n . Such a series is called a *higher arithmetic series* of order s . Let $a_1, a_2, a_3, \dots$ represent the series. A new series $b_1, b_2, b_3, \dots$ is formed from this by taking the differences of consecutive terms, so that $b_1 = a_2 - a_1, b_2 = a_3 - a_2$, etc. This is called the series of first differences. Let a series $c_1, c_2, \dots$ be formed from $b_1, b_2, \dots$ in like manner. These are the second differences. Let $d_1, e_1, \dots$ be the first terms in the series of third, fourth, . . . differences respectively. Since a_n is a polynomial of degree s in n and a_{n+1} is the same polynomial in $(n+1)$, it follows that b_n , which equals $a_{n+1} - a_n$, is of degree $s-1$ in n ; and, finally, that the n th term of the series of $(s-1)$ th differences is of degree one in n ; that is, the last series of differences is a simple arithmetic series. The series of s th powers of the natural number 1, $2^s, 3^s, \dots, n^s$ is the simplest example of a higher arithmetic series of order s .

The n th term of the series $a_1, a_2, a_3, \dots$ can readily be expressed in terms of $n, b_1, c_1, \dots$ namely,

$$a_n = a_1 + (n-1)b_1 + \frac{(n-1)(n-2)}{1 \cdot 2} c_1 + \frac{(n-1)(n-2)(n-3)}{1 \cdot 2 \cdot 3} d_1 + \dots,$$

the last term of the formula being of degree s in n . With fractional values of n this formula is much used for the purpose of interpolating between the terms of a given series numbers which shall follow the same general law of variation. For example, suppose it be required to find $\log 91.43$, given $\log 91 = 1.9590414$, $\log 92 = 1.9637878$, $\log 93 = 1.9684829$, $\log 94 = 1.9731279$. The required number is intermediate between $\log 91$ and $\log 92$, which are the first and second terms of the series having $\log(90+n)$ for its n th term. As the number 91.43 corresponds to $n = 1.43$, the value of $\log 91.43$ may be calculated approximately by assuming that for a small number of terms the series of logarithms coincides very nearly with a higher arithmetic series of order s , the closeness of the approximation increasing with higher values of s . The first terms of the successive series of differences are $b_1 = .0047464$, $c_1 = -.0000513$, $d_1 = .0000012$, etc. First try $s = 1$, that is, use only two terms of the formula for a_n . This gives $\log 91.43 = 1.9590414 + .43(.0047464) = 1.9610824$, which is correct to only five decimals. With $s = 2$, $\log 91.43 = 1.9610886$, which is less than the true value by one unit in the seventh place of decimals. With $s = 3$, that is, by using four terms of the formula for a_n , the value is obtained correctly to seven decimal places.

Geometric Series.—This is composed of the terms, $a, ax, ax^2, ax^3, \dots$. Each term is formed from the one preceding by multiplying it by x , so that the n th term is ax^{n-1} . If S denote the sum of n terms of the series, then

$$S = a + ax + ax^2 + \dots + ax^{n-1}.$$

The multiplication of this expression by x gives $xS = ax + ax^2 + ax^3 + \dots + ax^n$, whence, by subtracting from the preceding, $(1-x)S = a - ax^n$,

$$\text{and accordingly } S = \frac{a(1-x^n)}{1-x}$$

Recurring Series.—A more general form of series is the *arithmetico-geometric series*, in which the n th term is of the form $(a + bn)x^{n-1}$. It reduces to the arithmetic series when $x = 1$, and to the geometric series when $b = 0$. This in turn is a special case of a *recurring series*, which is defined as follows: Let $a_1, a_2x, a_3x^2, \dots, a_nx^{n-1}$ be the terms of such a series. If $r+1$ successive coefficients a_i are connected by a homogeneous linear relation of the form $a_n + p_1a_{n-1} + p_2a_{n-2} + \dots + p_ra_{n-r} = 0$, in which $p_1, p_2, \dots, p_r$ are given numbers and $n > r$, the series is called a *recurring series of order r* . The sum of n terms of a recurring series can always be found. The result is a rational fraction in x . The method of summation may be illustrated by the series of order 2. The defining relation is

$$a_n + p_1a_{n-1} + p_2a_{n-2} = 0.$$

Let $S = a_1 + a_2x + a_3x^2 + \dots + a_nx^{n-1}$. Multiply by $1 + p_1x + p_2x^2$. This gives

$$(1 + p_1x + p_2x^2)S = a_1 + (a_2 + p_1a_1)x + (a_3 + p_1a_2 + p_2a_1)x^2 + \dots + (a_n + p_1a_{n-1} + p_2a_{n-2})x^{n-1} + (a_np_1 + a_{n-1}p_2)x^n + a_np_2x^{n+1}.$$

Since $a_n + p_1a_{n-1} + p_2a_{n-2} = 0$, the above expression reduces to

$$a_1 + (a_2 + p_1a_1)x + (a_np_1 + a_{n-1}p_2)x^n + a_np_2x^{n+1},$$

$$\text{and hence } S = \frac{a_1 + (a_2 + p_1a_1)x + (a_np_1 + a_{n-1}p_2)x^n + a_np_2x^{n+1}}{1 + p_1x + p_2x^2}.$$

The Harmonic Series is $\frac{1}{a}, \frac{1}{a+d}, \frac{1}{a+2d}, \dots$, its terms being the reciprocals of the terms of an arithmetic series. The n th term is accordingly $\frac{1}{a + (n-1)d}$. The series is so named be-

cause the harmonic tones of a fundamental musical note are produced by the divisions of a vibrating string (or column of air in a tube) into lengths, which form a harmonic series. No formula exists for the sum of n terms of a harmonic series.

INFINITE SERIES.

Convergent Series.—Let $u_1, u_2, \dots, u_n, \dots$ be the terms of an infinite series, and let S_n denote the sum of the first n terms. If S_n approaches a definite, finite limit as n increases to infinity, the given series is said to be *convergent*. If, on the other hand, S_n increases without limit, the series is *divergent*. If S_n does not approach any limit, the series is called *indeterminate*, as in the case of the series $1-1+1-1+1-\dots$, for which, S_n takes the values 1 and 0 alternately as n increases. To illustrate these definitions, consider the infinite geometric series $a + ax + ax^2 + \dots + ax^{n-1} + \dots$. By the formula given above for the sum of a geometric series $S_n = \frac{a(1-x^n)}{1-x}$. If x is numerically less than unity, x^n diminishes to zero as n increases to infinity, and hence S_n approaches $\frac{a}{1-x}$ as a limit. This expression

is called the *generating function* of the series. The series and its generating function are equal for all values of x for which the series is convergent, that is, for values of x numerically less than 1. But if x is numerically greater than 1, S_n approaches infinity as n increases without limit. The series is then divergent and is no longer equal to the generating function. Similarly, with a recurring series, if its terms approach zero as a limit with increasing n , the terms $a_n x^n$, $a_{n-1} x^n$, $a_n x^{n+1}$ in the above formula for the sum of n terms of a series of order 2 approach zero and hence S_n has for limit $S = \frac{a_1 + (a_2 + p_1 a_1)x}{1 + p_1 x + p_2 x^2}$. A like result holds for a recurring series of any order.

A series can represent its generating function only for such values of the variable (or variables) on which it depends as will make it convergent, and hence the question of the convergence of a series is of paramount importance. Suppose at first that the terms of the series are positive. Then, if the ratio $u_{n+1}:u_n$ becomes and remains less than a proper fraction k as n increases without limit, the series $u_1 + u_2 + \dots + u_n + \dots$ is convergent. For in that case $u_{n+1} < k u_n$, $u_{n+2} < k u_{n+1} < k^2 u_n$, $u_{n+3} < k u_{n+2} < k^3 u_n$, and so on. Hence $u_n + u_{n+1} + u_{n+2} + u_{n+3} + \dots < u_n(1 + k + k^2 + k^3 + \dots)$. But as k is a positive number less than 1, the infinite geometric series $1 + k + k^2 + \dots$ is convergent and equals $\frac{1}{1-k}$.

Accordingly $u_n + u_{n+1} + \dots$ which is less than the finite quantity $\frac{u_n}{1-k}$, is a convergent series. If to this portion of the series the finite sum $u_1 + u_2 + \dots + u_{n-1}$ be added, the result is finite and the given series is, therefore, convergent. While the condition just given is sufficient to ensure the convergence of a series it is not necessary. Thus, if a and b are such that $0 < a < b < 1$, then the series $a + b^2 + a^3 + b^4 + a^5 + \dots$ is convergent, since it consists of the sum of the two convergent geometric series $a + a^3 + \dots$ and $b^2 + b^4 + \dots$. But $u_{n+1}:u_n$ alternates between large and small values as n increases and does not, therefore, remain less than a proper fraction.

If some of the terms of a given series are negative, the series is convergent provided that the series obtained by changing the signs of all the negative terms is convergent. For example, the series $1 - k + k^2 - k^3 + k^4 - \dots$, in which k is a positive number, is less than the series $1 + k + k^2 + k^3 + \dots$ and is, therefore, convergent if $k < 1$. It follows from the preceding considerations that any series is convergent if the ratio $u_{n+1}:u_n$ has a limit numerically less than 1 as n increases to infinity. Thus, for the logarithmic series $\log(1+x) = x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \dots + \frac{x^n}{n} - \frac{x^{n+1}}{n+1} \dots$ the numerical value of

$u_{n+1}:u_n$ is the same as that of $\frac{x^{n+1}}{n+1} : \frac{x^n}{n} = \frac{n}{n+1} x$.

The limit as n increases to infinity is x . The series will accordingly be convergent if x is numerically less than 1. For the exponential series

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots + \frac{x^n}{n!} + \dots,$$

$$u_{n+1}:u_n = \frac{x^n}{n!} : \frac{x^{n-1}}{(n-1)!} = \frac{x}{n}.$$

For any finite value of x this ratio becomes and remains a proper fraction as soon as n exceeds x in absolute value. Hence the series is convergent for all finite values of x .

A series of positive and negative terms is said to be *absolutely convergent* if the series obtained by making all of the terms positive is convergent. When the second series is divergent it sometimes happens that the first series is convergent, in which case it is called *conditionally convergent*, because the value of the sum is conditioned on the arrangement of the terms. For example, the logarithmic series is absolutely convergent for all values of x numerically less than 1. If $x=1$, it becomes $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \dots$, which is convergent and equals $\log 2$. But the series $1 + \frac{1}{2} + \frac{1}{3} + \dots$ obtained by making all the terms positive is divergent. A conditionally convergent series has the peculiar property that by changing the sequence of the terms the sum of n terms may be made to approach any desired limit as n increases to infinity, as may be exemplified by the preceding series. For let c be any number. Select in order as many of the positive terms of $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$ as will be sufficient to make a sum greater than c . Then select just enough negative terms so that when added to these the sum shall become less than c . Then add more positive terms until the sum becomes greater than c , and so continue. This process is possible, since the positive or the negative terms alone form a diverging series. With such an arrangement of terms the sum may be made to approach as near to c as desired.

Uses of Series.—Series are of the utmost value as affording a means for the expression of any given function. In particular, functions which are defined as solutions of differential equations are most frequently not expressible in any other form. In the theory of functions as developed by Weierstrass the convergent power-series is made the fundamental instrument of investigation, and from the properties of its defining series the nature of a function is determined. (See COMPLEX VARIABLE, THEORY OF FUNCTIONS OF). The expression of a function in the form of a series is of especial importance when it is desired to calculate its numerical value. It is by this means that various numerical tables, such as the logarithmic and trigonometric, are calculated.

Taylor's series: $f(x) = f(a) + f'(a)(x-a) + \frac{1}{2!}f''(a)(x-a)^2 + \dots + \frac{1}{n!}f^{(n)}(a)(x-a)^n + \dots$ is the formula most generally useful for the purpose of expanding any given function $f(x)$ in ascending powers of $x-a$, a being a given constant so chosen that the functions and its derivatives $f'(x)$, $f''(x)$, $\dots$, $f^{(n)}(x)$, $\dots$ are finite and continuous for values of x sufficiently near to a . Another form for Taylor's series, and the one to which the name is more frequently applied, is obtained by writing h in the place of $x-a$ so that $x=a+h$. The above equation then takes the form

$$f(a+h) = f(a) + f'(a)h + \frac{1}{2!}f''(a)h^2 + \dots + \frac{1}{n!}f^{(n)}(a)h^n + \dots$$

This series is convergent, if h is not too large. **Maclaurin's series** for the expansion of a function of x in ascending powers of x is obtained as a special case of the first form of Taylor's

series by putting $a=0$. The formula is of course inapplicable if the given function or any of its derivatives are not finite when $x=0$.

For the purposes of numerical calculation it is essential to know how close an approximation to the true value of the function may be obtained by using a given number of terms in Taylor's series and discarding the rest. If S_n denote the sum of the first n terms of the series and R_n the remainder of the series, then $f(x)=S_n+R_n$ and the amount of error introduced by using S_n as the approximate value of $f(x)$ is equal to the remainder R_n . An expression for the remainder in Taylor's series (second equation) was obtained by Lagrange in the form $R_n = \frac{1}{n!} f^{(n)}(a + \theta h) h^n$, in which θ denotes a

certain number between 0 and 1. To illustrate, the formula for $\sin(a+h)$ expressed in terms of Lagrange's remainder is

$$\sin(a+h) = \sin a + \cos a \cdot h - \frac{1}{2} \sin a \cdot h^2 - \frac{1}{3!} \cos a \cdot h^3 + \dots + \frac{1}{n!} \sin\left(a + \frac{\pi}{2} + \theta h\right) h^n.$$

Since $\sin x$ does not exceed 1 in numerical value the error in discarding the remainder of the series after n terms is not numerically greater than $\frac{h^n}{n!}$. If, for example, knowing

$$\sin 45^\circ = \cos 45^\circ = \frac{1}{\sqrt{2}}, \text{ it is desired to calculate}$$

$\sin x$ for succeeding angles at intervals of $1''$, the value for h is taken to be .0000048481, which is the radian measure for $1''$ in degree measure. Two terms of the preceding formula give the value of $\sin 45^\circ 1''$ correct to 10 deci-

$$\text{mals. For the remainder is } R_2 = \frac{-\sin\left(\frac{\pi}{4} + \theta h\right)}{2} h^2,$$

the first factor of which differs slightly from $-\frac{1}{2\sqrt{2}}$, while h^2 has no significant figure before the eleventh decimal place.

The cases in which Lagrange's formula is practicable for determining the limit of error are comparatively few in number. A convenient limit of error may frequently be found by comparing the given series with a simpler one of less rapid convergence, the limit of error for which can be determined. In particular, a series $u_1 - u_2 + u_3 - u_4 + \dots$ of alternately positive and negative terms which are numerically decreasing toward zero as a limit is convergent, and the error in taking only n terms is less than the next succeeding term u_{n+1} , but greater than $u_{n+1} - u_{n+2}$. For the series may be written $(u_1 - u_2) + (u_3 - u_4) + \dots$, which is a sum of positive terms and, therefore, increases, with the number of terms, toward a finite limit, or becomes indefinitely large. But the series may also be written $u_1 - (u_2 - u_3) - (u_4 - u_5) - \dots$, in which all the terms after the first are negative and hence the sum is less than u_1 . The numerical value of R_n is $u_{n+1} - u_{n+2} + u_{n+3} - \dots$, which, by a repetition of the preceding argument, is greater than $u_{n+1} - u_{n+2}$ and less than u_{n+1} . Thus, for the logarithmic series mentioned above, the error in stopping with the n th term is less than $\frac{x^{n+1}}{n+1}$ (if x is positive). For $x = \frac{1}{10}$ the value of $\log(1+x)$ is given by S_n correct

to at least $(n+1)$ decimal places. For values of x near 1 the series converges very slowly. A more rapidly converging series can be obtained by changing x into $-x$, which gives

$$\log(1-x) = -x - \frac{1}{2}x^2 - \frac{1}{3}x^3 - \dots,$$

whence, by subtracting the series for $\log(1+x)$,

$$\log \frac{1+x}{1-x} = 2\left(x + \frac{1}{3}x^3 + \frac{1}{5}x^5 + \dots\right).$$

In this x is replaced by $\frac{1}{2z+1}$, from which follows

$$\begin{aligned} \log \frac{z+1}{z} &= \log(z+1) - \log z \\ &= 2\left[\frac{1}{2z+1} + \frac{1}{3(2z+1)^3} + \dots\right]. \end{aligned}$$

This series is convergent for all positive values of z . The remainder after n terms is

$$2\left[\frac{1}{(2n+1)(2z+1)^{2n+1}} + \frac{1}{(2n+3)(2z+1)^{2n+3}} + \dots\right]$$

which is evidently less than the geometric series

$$\frac{2}{(2n+1)(2z+1)^{2n+1}} \left[1 + \frac{1}{(2z+1)^2} + \frac{1}{(2z+1)^4} + \dots\right]$$

the sum of which is $\frac{1}{2(2n+1)(2z+1)^{2n+1}(z^2+z)}$.

The error in neglecting R_n is accordingly less than the value of this expression.

The importance for numerical computation of having a series of sufficiently rapid convergence is illustrated by the formula for π . Gregory's series is $\frac{1}{4}\pi = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots$ which converges so slowly that according to Newton it would require 5,000,000,000 terms and 1,000 years' time to calculate the value of π to 20 decimals. On the other hand, by means of Machin's formula, which converges very rapidly, Shanks has computed the value of π to 707 decimal places.

Divergent Series.—It was supposed by the earlier mathematicians that divergent series were entirely useless. There is, however, a class of such series that have been found not only useful but necessary for the purposes of approximate computation. These have been employed for a long time by astronomers even after their divergence had been proved, their use being justified by the close agreement between calculation and observation. The series in question have the property that the terms at first decrease in numerical value until a certain minimum term is reached, after which they increase without limit. The series is converging as far as its minimum term, beyond which it is diverging. The converging portion of the series frequently affords a very good approximation to the value of the given function. The

series for the probability integral $\int_0^x e^{-t^2} dt$

is an example of this kind. By expanding e^{-t^2} in powers of t^2 and integrating term by term, this function is expressed by means of the series $x - \frac{1}{3}x^3 + \frac{1}{5 \cdot 2!}x^5 - \frac{1}{7 \cdot 3!}x^7 + \dots$, which is convergent for all finite values of x . For large values of x the convergence is too slow for practical purposes and the series

$$\frac{\sqrt{\pi}}{2} - \frac{e^{-x^2}}{2x} \left[1 - \frac{1}{2x^2} + \frac{1 \cdot 3}{2^2 \cdot x^4} - \frac{1 \cdot 3 \cdot 5}{2^3 \cdot x^6} + \dots\right]$$

is used instead. While this series is divergent

beyond a certain term, the sum of the converging portion gives an approximation having an error less than the numerical value of the last term used. This approximation is so good and the convergence so rapid that for values of x as small as 3 this series is more convenient to use than the first one and gives a value correct to eight decimals, the first 11 terms being convergent, while for $x=10$ the first 100 terms are convergent and give a value which is correct to at least 110 decimal places.

The theory of divergent series has recently been receiving considerable attention, chiefly from the French mathematicians. In particular, the problem of determining in how far the divergent series may validly be used as a purely formal representation of a function has been studied by Poincaré, who has developed some important and far-reaching results. An interesting account of the present state of the subject is given by Borel in his 'Leçons sur les séries divergentes' (Paris 1901).

Series of Functions; Multiple Series.—It is often important to express a function as a series the terms of which are given functions such as trigonometric or Bessel functions. Such series are of great service in mathematical physics, especially the *Fourier series* of sines and cosines of multiple angles, which is much used for representing functions having a periodic character. This series was first employed for that purpose by Fourier (1822) in his 'Théorie analytique de chaleur.'

In a simple series $u_1, u_2, \dots$ the general term u_n is a function of a single integer n defining its position in the series. A *double series* is one in which the general term $u_{m,n}$ is a function of two independent integers m, n . A *multiple series* is one in which the general term is a function of several integers $m, n, p, \dots$. Such series are of fundamental importance in the study of various classes of functions such as the elliptic functions and the multiple theta functions.

History and Literature.—Some of the properties of arithmetic and geometric series were known in very ancient times, as the oldest manuscript in existence, the Rhind papyrus, which is believed to be a copy of a work dating back 3,000 or more years before Christ, gives an account of some problems which are solved by means of these series. There is considerable ground for supposing that the general formula for the sum of an arithmetic series was known at that time, although it does not occur explicitly in mathematical literature until the time of Archimedes (287–212 B.C.). The formula for the sum of a geometric series was known to the Greeks as it is given by Euclid (about 300 B.C.), while the summation of the infinite series $1 + \frac{1}{2} + (\frac{1}{2})^2 + (\frac{1}{2})^3 + \dots$ was effected by Archimedes. The general expression for the sum of an infinite geometric series was first given by Vieta (1540–1603 A.D.). A formula for the sum of the squares of the positive integers was given by Archimedes, and for their cubes by Nikomachus (about 100 A.D.). Except for these two particular cases no knowledge of the summation of higher arithmetic series is apparent before the 16th century. The subject as we now know it was developed chiefly in the following century and it took its present form in the 'Ars conjectandi' of Jacob Bernoulli (1713).

The name "arithmetic series of higher order" was given by Leibnitz. Newton was the first to recognize the importance of infinite series as an instrument of mathematical investigation. His results were published in 1669 (not printed until 1704) in a work entitled 'Analysis per Aequationes Numero Terminorum Infinitas.' A systematic treatment of series was given by Euler in his 'Introductio in analysin infinitorum' (1748). The principle that an infinite series cannot be safely employed unless it is convergent was first given in this work. Gauss (1813) inaugurated the modern epoch in the theory of infinite series in his memoir, 'Disquisitiones generales circa seriem infinitam, $1 + \frac{a \cdot b}{1 \cdot c} x + \frac{a(a+1) \cdot b(b+1)}{1 \cdot 2 \cdot c \cdot (c+1)} x^2 + \dots$ ' He insisted

on rigorous tests for convergence and was first to give definite criteria for convergence and divergence. In the 'Cours d'analyse de l'Ecole Polytechnique' (Paris 1821), Cauchy extended the theory of power-series to the expansion of functions of a complex variable and gave the important theorem that a series is convergent

if the limit of $n\sqrt[n]{|u_n|}$ is numerically less than 1 when n increases to infinity. Further contributions, including additional criteria for convergence and a development of the principle of continuity of series, were made by Abel (1826) in his 'Recherches sur la série,

$$1 + \frac{m}{1} x + \frac{m(m-1)}{1 \cdot 2} x^2 + \dots'$$

('Œuvres complètes,' Vol. I, p. 223). This celebrated memoir is a model of scientific accuracy and comprehensiveness, and exerted an important influence on the growing spirit of rigorous and critical investigation.

Among modern works on series the following may be mentioned: Chrystal's 'Algebra' (Edinburgh 1886), chaps. xx, xxvi–xxxi; Osgood's 'Introduction to infinite series' (Harvard University Publications 1897); Godefroy's 'Théorie élémentaire des séries' (Paris 1903); Runge's 'Theorie und Praxis der Reihen' (Leipzig 1904); Borel's 'Leçons sur les séries à termes positifs' (Paris 1902); Hadamard's 'La série de Taylor' (Paris 1901); Jordan's 'Cours d'analyse' (Paris 1893), Vol. I, chap. iii; 'Encyclopädie der Mathematischen Wissenschaften' (Leipzig 1898–1904), Vol. I, part 1, pp. 47–146.

JOHN I. HUTCHINSON,
Professor of Mathematics, Cornell University.

SERIES, the term applied to the rocks laid down during an epoch. Thus we speak of the Acadian series as laid down in the Acadian epoch. Series is a subdivision of system (q.v.) just as epoch is a subdivision of period (q.v.).

SERIES-PARALLEL CONTROLLER.
See ELECTRICAL TERMS.

SERIN, in ornithology, a finch, *Serinus hortulanus*, which is closely allied to the canary. The bird's mantle and back are of a dark-grayish brown, each feather being edged with a broad strip of yellow. Its head is olive-gray and the throat and breast are of a bright gamboge-yellow, shading to white on the belly. It is four and one-half inches long. The serin-finch is noted as a lively and indefatigable singer. It is migratory and spends the summer and oftentimes the winter in Middle Europe.

SERINGAPATAM, sēr-ing-ga-pa-tām' (properly, Sri-ranga-patanam, "city of Vishnu"), India, a celebrated town and fortress, the former capital of Mysore, 245 miles west by south from Madras, on an island formed by two branches of the Kaveri. The fort, a massive structure, stands on the western end of the island and contains within its walls the ruins of the palace of Tippu Saib (q.v.), a mosque built by the same ruler and an old temple. Just outside of the fort is Tippu's graceful summer palace, now in ruins. At the east end of the island, near the suburb of Ganjam, where almost all the inhabitants now reside, is the mausoleum in which Tippu and his father, Hyder Ali, are buried. The fort was three times besieged by the British, first in 1791 and afterward in 1792 and 1799. On the last occasion the fortress was carried by assault, Tippu being slain. The town once contained about 150,000 persons, but its population in course of time has steadily decreased until now it is only about 12,500.

SERINUS, in ornithology, a genus of the sparrow family *Pringillidæ* (q.v.), having a stout cone-shaped bill, broad at the base; the nostrils basal, round and hidden by stiff frontal feathers directed forward, gape straight, without bristles. The serinus is small, compact and active; the legs are short and scutellate; the feet strong; the wings which are moderately long and somewhat pointed have a minute outer primary; and the tail is deeply forked. The serin (q.v.), *Serinus hortulanus*, the *S. canonicus*, the *S. canarius*, the canary, and *S. pusillus*, the red-fronted finch, are inhabitants of the Western Palearctic regions, but some species are to be found in the Eastern Palearctic, Oriental and Ethiopian regions.

SERIOLA, in ichthyology, a genus of *Carangidæ*, divided into 12 species and inhabiting temperate and tropical waters. The body is oblong and slightly compressed, and the abdomen is rounded; the first dorsal fin is continuous, with feeble spine; villiform teeth in jaws and on the vomer and palatine jaws. The smaller species are valueless, but the larger species which range from four to five feet in length are used as food.

SERIPHOS, sē-rī'fōs, or **SERPHO** (now **SERPHOS**), Greece, a mountainous island of the Cyclades group, 50 miles south of Eubœa. It contains iron, copper and lead ore—formerly exploited. The products are chiefly corn and wine. The ancient town participated in the battle of Salamis, furnishing the Athenians with several ships. Seriphos was also a place of exile for the Romans. Pop. 4,000.

SERLIO, sār'lē-ō, **Sebastian**, Italian artist: b. Bologna, 6 Sept. 1473; d. Fontainebleau, 1554. He worked as painter and architect at Pesaro for 14 years, leaving that city (1514) for Rome and Venice, where he became Titian's associate. He published at Venice in 1537 his voluminous treatise 'Regole Generale d'Architectura.' He is supposed to have worked with Pierre Lescot on the Louvre. Primaticcio in 1541 was appointed architect at Fontainebleau with Serlio as assistant.

SERNA Y HINOJOSA (lā-sār'nā ē ēn-ō-hō-sā), **José de la**, famous Spanish general: b. Jerez de la Frontera, 1770; d. Cadiz, 1832. He fought in the Peninsular War against the

French and served under Wellington in 1813. After working his way up from the ranks to the position of major-general, in 1816 he was placed in command of the Spanish Royalist army in Upper Peru. In this capacity he was in constant conflicts with the natives and numerous uprisings gave him the opportunity to display his military ability. He was, however, defeated by the patriots at Salta and Jujuy, and owing to disagreements with the viceroy in regard to the conduct of the army during the campaign, resigned in 1819, but was at once made lieutenant-general and president of the council of war. Not long after this he was again appointed to the command of the army to suppress the uprising under San Martin, and on 29 Jan. 1821, upon the deposition of the viceroy Pezuela by his officers, he became viceroy. He was not able to stem the tide of San Martin's successes and on 6 July 1821 was forced to evacuate Luna, retreating to Cuzco. From here he directed his army and maintained it for over three years against the patriots without any assistance from Spain, and keeping his ground in the interior with great skill and resolution. He was finally defeated on 9 Dec. 1824 by the patriot leader, General Sucre, in the battle of Ayacucho. Though outnumbered by the Royalists, the patriots won the battle and Serna with his whole army was captured. He was severely wounded during the fight, and was afterward released and sent back to Spain, where he died at the age of 62.

SEROUS MEMBRANE, a delicate glistening tissue of flattened endothelial cells, supported by a fibrous and elastic layer in which are capillaries and lymphatics, that glistens on exposure. The serous membranes of the human body are so called because moistened by a serous fluid, and form closed sacs. For the most part they line certain cavities of the body and are reflected over the surface of the organ or organs contained in the cavities. The portion of the membrane lining the walls of the cavity is known as the parietal portion, the other is the visceral portion. The serous membranes, six in number, are the peritonæum, lining the abdominal cavity and reflected upon the stomach, liver, intestines, etc.; the two pleuræ lining the thoracic or chest cavity, and reflected upon the lungs; the pericardium, a fibro-serous sac covering or enclosing the heart; and the tunica vaginalis, a closed sac surrounding each testicle. In the female, where the ovum passes from the ovary into the Fallopian tube, the peritonæum is not a closed sac. The serous membranes are kept moistened by a watery lymph-like fluid, a variety of serum, which, if secreted in large quantity, as in dropsy, may produce bad results. Lymphatic vessels open freely on the surface of serous membranes, hence they are sometimes spoken of as lymph-sacs and the cavities they line as lymph-cavities. A grave danger arising from injuries and inflammation of serous membranes is the absorption of septic material by the lymphatics. Dropsical effusions, hemorrhage, formation of pus and deposits of fibrous exudations which cause adhesions and prevent mobility of viscera are the principal results of inflammation of these membranes. See PERITONEUM.

SEROW, a shaggy goat-antelope (*Nemorhædus bubalinus*) of the Himalayas, where it

frequents, singly, or in family parties, the roughest slopes, at an altitude between 6,000 and 12,000 feet. Its habits are similar to those of the goral, Rocky Mountain white goat (qq.v.) and other members of the genus, all of which are called "serows" by some writers. Consult Lydekker, 'The Game Animals of India' (1907).

SERPA PINTO, sar'pā pēn'tō. See PINTO, ALEXANDRE ALBERTO DA ROCHA SERPA.

SERPENT, (1) in *astronomy*, one of the 48 varieties of ancient constellations extending serpent-like through a wide expanse of sky. (2) In *music*, an almost obsolete bass instrument, consisting of a wooden tube, about eight feet long, increasing conically from one inch diameter at the mouth-piece to four inches at the open end, twisted into U-shaped turns, followed by a large circular convolution. This is covered with leather, and has a mouth-piece like a horn or trombone, and keys for the several notes to be produced. The serpent is a transposing instrument, being in B flat, and the part it is to take is, therefore, written a note higher than its real sound. Its compass is three octaves and one note.

SERPENT-CHARMING, an art largely practised in Egypt, India and other Eastern lands; there are allusions to it in the Hebrew sacred books, namely, Ps. lviii, 5, the adder which will not hearken to the voice of charmers; Eccles. x, 11 and Jere. viii, 17; also in some of the Greek and Latin classics. The power of charming the most formidable serpents, as exercised by the snake-charmers, is unquestionable; nor is it true that before making an exhibition of their art the charmers always extract the poison fangs of the creature, though that is often done. Dr. Davy, in his 'Interior of Ceylon,' expresses his belief in the reality of this singular power. "I have examined the snakes," he writes, "and have found the fangs in and uninjured. These men do possess a charm, though not a supernatural one—namely, that of confidence and courage. . . . They will play their tricks with any hooded snakes (*Naja tripudians*), whether just taken or long in confinement, but with no other kind of poisonous snakes." The serpent-charmers are sometimes employed to rid gardens of serpents; and they readily recognize when a serpent is concealed anywhere. In practising their art for this purpose, as also in their exhibitions, they employ a kind of flute in aid of their incantations. When the serpents issue from their hiding places the performer secures them by pinning them to the ground with a forked stick. Those familiar with hypnotism and the French fad for hypnotizing chickens, that flourished in Paris early in the 19th century, will easily recognize that serpent-charming is hypnotic in character.

SERPENT-EAGLE, the secretary-bird (q.v.).

SERPENT-HEAD, or **WALKING-FISH**, a fish of the East Indian and African genus *Ophiocephalus*, the type of a family, allied to the climbing perch, and like it able to live a long time out of the water, and to travel by wriggling through moist grass, from one pool to another. The body is elongate, two to three feet long, and covered with medium-sized scales, those on the depressed head being platelike. About 30

species are known, inhabiting many parts of Asia, the commonest being *O. striatus*, which is sometimes found torpid in dried-up pools and irrigation tanks. When living in muddy water they must rise to the surface from time to time to take in air, or they will smother to death. These fishes are eaten throughout the Orient.

SERPENT-WORSHIP, or **OPHIOLATRY**, a primitive form of religion which is still found existing among uncultured races. The serpent's change of skin may well have been suggestive of resurrection and immortality; the more common supposition that the serpent was regarded by his savage worshippers as the personification of evil and of maleficence, and as a power to be appeased by gifts and worship, does not appear to be justified by the reports of travelers, though the Apophis-serpent of the Egyptian Hades, as well as the wicked Aji Dahaka of the Zoroastrians, were undoubtedly worshipped purely through fear. The brazen serpent erected by Moses in the wilderness and afterward preserved until the days of Hezekiah was broken in pieces by that king (2 Kings xviii, 4), the image having been made an object of religious worship; this was apparently a recrudescence of primitive serpent-worship among the people of Judah. The brazen serpent, it is conjectured by Renan ('Hist. Peuple d'Israël I, xi), was a primitive idol of Jahve. In the Biblical narrative Satan assumed the form of a serpent; among the ancient Egyptians, Typhon was the evil deity, and this idea has generally persisted in Asia, and is apparent in the hieroglyphics of both the Chinese and Mexicans. The serpent whose head the Messiah was to crush, in heathen fable became the hydra of Hercules, and in India the great monster over whom Krishna triumphed, while Roman mythology developed the 100-headed snake slain by Jupiter. We see a trace, and more than a trace, of a primitive worship of the serpent in the great serpent which guarded the citadel of Athens and which was fed every month with honey-cakes; also in the embassy from Rome on the occasion of a plague, to the temple of Æsculapius at Epidaurus, whence was brought a living serpent which was received at Rome with great ceremony. Serpent-worship is still extensively practised in India. Among no people has the mystery of this worship weighed more than on the aborigines of America. It has given name to rivers: examples, Kennebec and Antietam. The name for *spirit* and *snake* are one among the Dakotas, the Shawnees and the Sacs. The Ojibways and other aborigines dread to kill a rattlesnake, and if they find one in their path they pray it to go away and spare them and their families. In Mexico sculptured images of serpents are found as large and as carefully wrought as those of India. There is a vast amount of literature on the subject, which covers the folklore of all peoples, and the serpent seems to have been worshipped more than any other creature, and to have been associated with the idea of fertility or fecundity. In many East Indian ceremonies the serpent deities are constantly associated with women; certain priestesses were selected for their purity, and other women were chosen as "wives" of the snake, and participated in licentious rites. The lore

of the serpents is much mixed with dragon literature. Consult all folklore books, and Brinton, 'Myths of the New World' (1896); Hartland, 'Primitive Paternity' (1909); Frazer, 'Golden Bough'; Deane, 'Serpent Worship'; Lawson, 'Modern Greek Religion' (1910); Bourke, 'Snake Dance of the Moquis'; Fowler, 'Roman Festivals'; Fergusson, 'Thee and Serpent Worships' (London 1869).

SERPENTINE, hydrous magnesium silicate, is an abundant and widely distributed mineral. Its hardness varies more than that of any other mineral, ranging from 2 in the variety picrolite up to 6 in bowenite. Its specific gravity varies from 2.14 in some chrysotile to 2.80 in some precious serpentine. It often occurs in pseudomorphs, over a dozen of which have been described. Among these the most common are the pseudomorphs after chrysotile, enstatite, amphibole and pyroxene. Its varieties are mostly based on structure. The massive include precious serpentine, translucent and of rich, dark or pale green color; common serpentine, similar in color, but nearly opaque. The lamellar varieties include antigorite and marmolite. Williamsite, though more massive, is one of the lamellar varieties. It is apple-green and translucent and is often cut and polished. Chrysotile is fine fibrous, the fibres being easily separable and flexible. Its lustre is silky, color pale green, yellow or brown. It often occurs in veins in massive serpentine. See ASBESTOS.

Serpentine rocks occur in masses often of enormous dimensions. They are formed, as indeed are all serpentines, by the alteration ("serpentinization") of other minerals, most commonly olivine (peridotite), pyroxene or amphibole. They are often more or less mixed with limestone or magnesite, these minerals giving the mass a clouded or veined appearance. Verd antique (q.v.) or opicalcite and many other serpentine rocks are known as serpentine marbles and are extensively used in interior decoration. Some of them are very highly prized for their rich green, yellow and brown colors, others are beautifully mottled with red. (Consult Merrill, 'Stones for Building and Decoration'). Many buildings in Philadelphia and other cities are constructed of a green serpentine rock from West Chester, Pa. Among the most noteworthy regions producing serpentine are England, Ireland, Maryland, New Mexico, California and Washington.

SERPENTS, or **SNAKES**, reptiles of the saurian class *Ophidia*, characterized by an elongated, cylindrical, limbless, scaly form, and distinguished from lizards (q.v.) by the fact that the halves (*rami*) of the lower jaws are not solidly united at the chin, but movably connected by an elastic ligament. The vertebrae are very numerous, gastrocentrous and procœlous. Each vertebra is connected with its neighbors that is, hollow in front and convex posteriorly, by free ball-and-socket joints, horizontal connecting projections preventing twisting, while admitting of considerable vertical and horizontal play; and bears ribs, which may exceed 300 pairs in number. No front limbs, sternum or sacrum are ever developed, but vestiges of ancestral hind limbs remain in the boas, pythons and closely related forms, and in some lowly burrowing groups. The ventral tips of each

pair of ribs are fastened to opposite ends of one of the abdominal scutes (gastrosteges), forming a mechanism for locomotion in the absence of legs. Progression is by three methods. "The animal," says Stejneger, "may glide, perhaps in a perfectly straight line, by use of its ventral scutes, each, on finding some resistance, forcibly pushing the animal forward. It may walk by allowing each scute to act as a pair of feet, the lateral portions being alternately carried forward and pushed back; an undulatory movement, like that of myriapods, would result from this mode. The third method is by pushing, as the underground snakes do almost exclusively. Ordinarily ophidians combine the three methods. The sea-snakes progress by an undulatory movement and by the sculling action of the paddle-like tail. . . . It is impossible for any ophidian to jump, and it is with extreme difficulty that more than the anterior half of the body can be raised, unassisted, from the ground."

Structure.—The skull of serpents consists of a series of bones homologous with the cranial bones of other vertebrates, but slight and, outside of the brain-box, joined by elastic ligaments, permitting great distention of the mouth and throat, so that serpents are able to swallow objects of large bulk. This arrangement is further facilitated by the quadrate bone, which articulates the lower jaw with the skull, being movable. The jaws are provided with hooked teeth of conical shape, ossified to the jaws, but not lodged in distinct sockets, which are useless for mastication, and are of service only in holding the prey in the mouth. The teeth are never permanent, but are capable of being renewed, like those of fishes, whenever the old ones become worthless. Valuable characters in classification are derived from the conformation and disposition of the teeth. Thus in the typical, non-poisonous serpents, both jaws and the palate bear continuous rows of solid conical teeth and the upper maxillæ are immobile. In the viperine snakes simple conical teeth are absent on the upper maxillary or jaw bones, which are of small size and can be moved upward or downward at will. The upper maxillæ in these latter snakes further bear each a so-called "poison-fang," an elongated canaliculated tooth perforated by a canal which communicates internally with the duct of the poison-gland. These fangs are capable of being elevated or depressed. (See RATTLESNAKE; VIPERS). As regards their internal structure serpents present few points requiring notice. The digestive system comprises large salivary glands, a distensible gullet, stomach and intestine, which terminates in a cloaca—the external opening of the cloaca being transverse in conformation. There is no urinary bladder, yet serpents drink a great deal of water and must have it in abundance when kept in captivity; at the same time they have remarkable powers of long fasting. The heart (see REPTILES) consists of three chambers only—two auricles and a ventricle, the circulation being of the mixed character characteristic of reptiles and amphibians. The lungs, ovaries and other paired or symmetrical organs exhibit an abortive condition of one of these structures, the left lung, for example, far outgrowing the right one, and doing all the work. "The trachea is long and may be provided with air-cells and the

larynx can be projected during the tedious process of swallowing, when, too, the air-cells and the posterior reservoir come into play." All these modifications are in adaptation to the slender, elongated form of the animal and to its methods of life. The sexes are perfectly distinguished and the penis of the male consists of a pair of organs (hemipenes), grooved on their inner sides, which when erected are pressed together and so form a tubular intermittent instrument. The special modifications of this organ constitute one of the most stable "characters" or criteria by which to classify the subdivisions of the *Ophidia*. The eggs of the viperine, and some other snakes, are retained within the oviduct of the female until the young escape, so that these species are ovo-viviparous. In the majority of serpents, however, the eggs, which are oblong and have a leathery integument, are deposited in warm soil, among rotting wood, in heaps of decaying vegetation or in some similar warm and concealed place, where they are left to mature; but the pythons coil about their eggs and incubate them by the feeble heat of their bodies; and all kinds wait for and protect their young when born. It is true, to a limited degree, that at times of danger, the little snakes take refuge in the capacious mouth and throat of the mother.

Sense-organs.—The senses of serpents vary in respect to acuteness. The skin is highly sensitive to touch, and a few snakes have tentacle-like outgrowths upon the muzzle supposed to be "feelers"; this sense is principally developed, however, in the tongue, which is thread-like, forked at the end, usually black, very long and far-protrusible through a notch in the upper lip when the mouth is closed. With this tongue—mistaken by the ignorant for a "sting"—the animal tests the quality of all objects as it moves about and gains most of its information. There are no external ears, but the hearing in some, if not in all, is good. The nostrils are at the tip of the snout, and the sense of smell is keen,—serpents find and follow their prey mainly by its aid. The eyes of serpents have no eyelids, yet they sleep; a watch-glass-like layer of the skin overlies and protects the ball and peels off in the annual exuviation of the outer skin (see **MOLTING**). The pupil is usually round, but in the boas and some others is a mere vertical slit.

Phylogeny.—Serpents are the latest and highest development of the reptilian type and seem to be the only representatives of the class which are now flourishing rather than declining. They are distributed principally in the warmer regions, only the smaller forms extending into the northern temperate zone. Where the climate is even moderately cold in winter snakes creep into animals' burrows, holes among loose rocks and other underground places and undergo hibernation,—often many entwine together, especially toward spring, when they are seeking mates. A similar retirement (æstivation) occurs in countries exposed to annual periods of heated drought. By far the greater number of ophidians are terrestrial, although some are arboreal, others amphibious and a few exclusively marine. About 400 recent genera and nearly 1,800 species are known, but only about 35 fossil forms, according to Eastman, who reminds us that many fragmentary remains of the Cretaceous Age, at first regarded as

ophidian, are now known to be dolichosaurian. Tertiary snakes can hardly be distinguished from modern species and occur in all parts of the world, including the Eocene of New Jersey and the Eocene and Miocene of the Rocky Mountain region. These remains and other considerations make it plain that the serpents are an outgrowth from the same ancestral stock (*Sauria*) as the lizards.

Classification.—The following is a progressive arrangement of families, from lowest to highest in organization, some of them including several groups formerly regarded as separate families:

1. *Typhlopidae*. Burrowing snakes of southern Asia and the islands of the Indian Ocean. Have vestiges of the pelvis and the eyes covered by skin.

2. *Glauconidae*. Replace the *Typhlopidae* in Africa and tropical America.

3. *Ilysiidae*. Burrowing snakes of the tropics with vestigial hind limbs. Tail short and blunt (blind snakes).

4. *Uropeltidae*. Burrowing snakes of Ceylon and southern India. Tail truncate, ending in a flat shield (shield-tails).

5. *Boidae*. Large, typical snakes, with rudiments of hind legs and pelvis and ventral scales transversely enlarged. The family comprises about 70 species, found all over the world in tropical and subtropical countries and noted for their rapacious habits and ability to crush animals, large as compared with themselves. Typical genera are *Python* (q.v.), with about 20 Palæo-tropical and Australian species, one in Mexico, and the *Boa* (q.v.), which has many South American species and a few in Madagascar.

6. *Xenopeltidae*, one Malayan species.

7. *Colubridae*. Includes 90 per cent of all snakes; the pterygoid bone reaches the quadrate. It is divisible into three series: (1) No teeth grooved; (2) the posterior maxillary teeth grooved (poison-fangs); (3) the anterior maxillary teeth grooved (poison-fangs). The first includes the non-venomous colubrine snakes of more than 1,000 species, such as the blacksnake, garter-snake, water-snake, hog-nose and the ordinary harmless serpents of all parts of the world. The second group (2) comprises opisthoglyph, partly poisonous snakes, found in the tropics of both continents, terrestrial, aquatic, even marine species. The third group (3) contains many violently poisonous, proteroglyph snakes. Here fall the cobras, coral snakes and other elapine serpents, whose bite is to be dreaded.

8. *Amblycephalidae*. Tropical snakes, in which the ends of the pterygoids are free, not reaching the quadrates. Harmless, but resembling poisonous snakes.

9. *Viperidae*. Maxillaries, short and movable, so as to erect the poison-fangs, which are the only maxillary teeth. Two subfamilies: (1) the Old World vipers; (2) the rattlesnakes (q.v.) and related pit-vipers.

ERNEST INGERSOLL.

SERPUKHOV, sër-poo-höf', or **SERPUCHOW**, Russia, a town in the government of Moscow, on the Nara River, 57 miles southwest of the city of Moscow, comprising three divisions. One of these, the Fort, is enclosed by walls, now in ruins. An ancient cathedral is the only building worth noting. Agriculture is an important industry, and there are manufactures of wool, cotton, leather, paper, chemicals, etc. An active trade with the interior is carried on, especially over the Oka River.

SERPULA, a tube-making marine chaetopod worm (see CHÆTOPODA), which often lives and reproduces its tubes in such close proximity over considerable areas as to form, with the cemented fragments of coral, sea-shells, sand, etc.; caught among its entwined tubes may be large masses of rock. Such are to be seen on the coast of Florida.

SERRA DA ESTRELLA, sār'rā dā ës-trāl'yā, Portugal, in the province of Beira, is the highest range of the country, attaining an altitude of 6,540 feet. It belongs to the Guadarramas system, and is a continuation of the Gata Range in Spain, terminating in the Serra de Lousão. Numerous lakes, some of which are warm, occur in the ridge, and the rivers Condicira and Unhaes form fine cascades. The surrounding scenery is remarkably picturesque.

SERRA DO MAR, doo mār, a coastal range of mountains running east by north from Sao Paulo, Brazil.

SERRANIDÆ, a family of acanthopterygian bony fishes typified by the sea-bass (q.v.). The body is generally rather short and heavy, slightly compressed, with moderate or large head and covered with usually ctenoid scales. The mouth is usually large and is provided with numerous teeth all of one kind arranged in broad bands on the vomer and palatine bones as well as on the jaws. The fins are well developed and the dorsal spines usually large and strong but variable in number. Sometimes the dorsal and caudal fins are furnished with filaments or streamer-like appendages. The swim-bladder is usually comparatively small and attached to the body walls. This is a large family of carnivorous fishes, including about 70 genera and more than 400 species, almost all of which are marine and especially abundant in tropical waters. They are closely related to the *Percidæ* and, like that family, include a large number of valuable food-fishes. In North American waters no less than 28 genera and 90 species are found, almost all of which are good and a number very important food-fishes. Among them may be mentioned, in addition to the sea-bass, the striped bass, white perch, yellow bass, jew-fish, groupers and squirrel-fish,

most of which are described elsewhere in this work. Consult Jordan and Evermann, 'The Serranidæ,' *Bulletin No. 8* (United States Fish Commission, Washington 1890).

SERRANO Y DOMINGUEZ, sër-rā'nō ē dō-mën'gāth, Francisco, DUKE DE LA TORRE, Spanish statesman: b. Anjonilla, Andalusia, 18 Sept. 1810; d. Madrid, Spain, 26 Nov. 1885. He entered the Military College in 1822, became an ensign in 1825 and served in the coast guard until 1833, but after the death of Ferdinand VII he gained favor with Queen Isabella and espoused the cause of the child queen Isabella II, against the Carlists. He played an active part in the troublous politics of Isabella's reign, at times holding high offices in the administration and again at variance with the ministry. For implication in the insurrection of Saragossa in 1854 he was exiled but in June returned and took part in the successful revolution of Espartero and O'Donnell. In 1857 he was sent as Ambassador to Paris, and in 1860 he went to Cuba as captain-general. In 1866, after the overthrow of O'Donnell's government, Serrano was banished, but in 1868 returned, assisted in overthrowing the queen's army and forced her to leave the country. He then acted as regent until the accession of Amadeus of Savoy in 1870. He was successful in his warfare against the Carlists both in 1872 and in 1874, and during much of the latter year was at the head of the government. He resigned the monarchy into the hands of Alfonso XII, in 1875, but continued active in political life, and in 1883 was appointed Ambassador to France.

SERRELL, Edward Wellmann, American civil and military engineer: b. 5 Nov. 1826; d. New York City, 25 April 1906. He entered the engineering profession and was employed on the Erie Railroad, the Central Railroad of New Jersey, the Panama survey, the Niagara bridge, the Hoosac Tunnel and other large engineering works. He was an assistant to the chief of topographical engineers, United States of America; entered the Federal engineer corps as a colonel in the Civil War; was at the capture of Fort Wagner and devised the "Swamp Angel" battery that shelled Charleston, S. C. He became chief engineer for the Department of the South, and was in 126 actions, being brevetted brigadier-general. He suggested improvements in guns and gun-carriages, and issued some 50 reports on railroads and bridges.

SERRES, Dominic, English marine artist: b. Auch, Gascony, 1722; d. London, 1793. He is said to have been a nephew of the archbishop of Rheims and was intended for the Church, but this not suiting his taste he ran away from home and became a sailor, eventually becoming master of a Spanish trading vessel. Being taken prisoner by a British warship, he was carried to England, where he afterward resided. Having had some instruction in drawing, he began life in his adopted country as a painter of naval pieces, for which the wars of the period furnished subjects. Serres became a member of the Incorporated Society of Artists in 1765 and exhibited with them for two years. On the establishment of the Royal Academy in 1768 he was chosen one of the foundation members. Among the pictures exhibited by Serres at the

Royal Academy were 'The Siege at Fort Royal, Martinique' (1769), and 'The Engagement between the Serapis and the Countess of Scarborough with Paul Jones and his Squadron' (1780). In 1792 he was appointed librarian to the academy, and also marine painter to George III.

SERRES, John Thomas, English marine artist: b. London, December 1759; d. there, 28 Dec. 1825. He was the elder son of Dominic Serres (q.v.), and followed his father's profession. In 1780 he began to exhibit at the Royal Academy. In 1790 he went to Italy to further study his art. In 1793 he succeeded his father as marine painter to the king and was also appointed marine draftsman to the Admiralty. In 1801 he published a translation of 'The Little Sea-Torch,' a guide for coasting ships, and in 1805 his 'Liber Nauticus,' or instructor in the art of marine drawing. He had married in 1791, and although legally separated from his wife in 1804, her pretensions to be the Princess Oliver of Cumberland involved him in many difficulties throughout the latter part of his career.

SERTORIUS, sēr-tō'rī-ūs, **Quintus**, Roman general: b. Nursia, Italy, about the end of the 2d century B.C.; d. Asia Minor, 72 B.C. He served with distinction under Marius against the Teutones and in Spain, and held the office of quæstor in Cisalpine Gaul, but becoming embroiled in a quarrel with Marius, who had opposed his election as consul, he fled to Spain, where he collected a force to oppose the army of subjugation sent by Sulla to subdue that country. But the means of Sertorius were unequal to the conflict, and embarking at New Carthage he passed into Africa and successfully commanded the subjects of Mauritania, who were in revolt against their king. This success gained him the confidence of the Lusitanians, who placed him at the head of the large force with which they were opposing Sulla, and Sertorius withstood for a number of years a much superior force of Romans successively commanded by Annius, Metellus Pius and Pompey. But Sertorius loved Rome and fought with reluctance against its forces. He, therefore, now accepted the offer of Mithridates, 3,000 talents and 40 ships of war, to ally himself with him in an effort to recover Bithynia and Cappadocia. Sertorius received the sum and was making preparations to push the war, when he was slain through the treachery of Perperna, who had joined him two years before and who now assassinated him at a feast.

SERUM THERAPY, a mode of treatment of disease by means of the modified blood serum of man or other animal. It is one of the subdivisions of therapeutics (q.v.) and in its more scientific details is of distinctly modern development. In its early and crude forms, however, serum therapy is of very great antiquity. Serum therapy is employed both for its protective power as well as for its curative aid. Inasmuch as the gradual growth of knowledge concerning the protective power of blood serum has been in large part an offshoot of the study of bacterial poisons it is usual at the present time to include under the study of serum therapy a number of related subjects—particularly the effects of bacteria toxins in disease, hence they will be included in this ac-

count. It is related that King Mithridates knew that by taking small doses of snake poison he might render himself immune to larger doses and in this old, well-recognized principle one sees the early shadowings of the principle of isotherapy—the principle now so fully recognized that after all the body tissues are the best defense against infectious diseases. The exact details of all the protective processes are not as yet known, but enough have been discovered to place serum therapy on a sound basis. It has been known for a long time that many infectious diseases rarely attack a person a second time. This is characteristically true, for instance, in measles, scarlet fever and whooping cough. It is less true for diphtheria, for typhoid fever, for pneumonia. When the discovery of bacteria made it evident that many of these diseases were due to these low plants, it was then shown that injections of the bacteria caused the disease and that a certain grade of immunity was produced. Following this it was learned that it was not necessary to inject the bacteria themselves to get symptoms of the disease, but that the injection of the filtered products of their growth, that is, their toxins, might cause the same phenomena, and finally it was shown that as a result of the injections, either of the bacteria, or of their dead bodies, or of their filtered toxins, certain changes took place in the blood and that new substances were formed in the blood which in different ways counteracted the effects of the injections; finally it was a logical step to develop these anti-bodies—as they have been called—in the blood serum of another animal and use this serum in the treatment of the particular disease in man. This is the simple explanation as applied in the serum therapy, say of diphtheria. After the success of the antidiphtheritic serum became established it was thought that all of the infectious diseases would be immediately conquered by an application of the same principle but in practically all instances it was found that whereas the principle worked out very definitely for diphtheria, it did not apply to other infectious diseases as directly, and the results while at times seemingly excellent, at other times were very disappointing. This disparity between the good success in diphtheria with antitoxic sera and the lack of results in other infections served to draw attention to the fact that the protective mechanisms in the blood serum were much more complicated than was at first thought. A new line of study was opened when it was shown that in some instances following the use of protective sera, the bodies of injected bacteria resulted from the use of the serum. Thus in were found to be destroyed, that is, bacteriolysis addition to a chemical antidote, antitoxic serum, a bacteria-destroying serum became a possibility. It is highly probable that in tuberculosis this bacteriolytic action of the blood serum is constantly at work. At about the same time, or even previously, the peculiar power that certain blood sera possessed in agglutinating or causing bacteria to clump up and hang together was observed in typhoid fever. This led to the discovery that certain specific substances, called agglutinins, were present in certain instances and that these agglutinins were protective devices elaborated by the body in

its struggle with infectious micro-organisms. This peculiar property of agglutinating bacteria has developed one of the most reliable of tests—the so-called Widal reaction for the detection of typhoid fever. Thus far practical agglutinating sera have not been devised. Agglutination seems to be an active factor in immunity rather than a passive one. As shown in our article on IMMUNITY two distinct phases are present, an active and a passive immunity, and at the present time it is the endeavor of serum therapy to bring into defensive action as many of the factors as possible. Thus by injecting into the human body living bacteria, which have had their virulence modified, either by growing them in oxygen or by attenuation through growth in certain animals, or by subjection to high temperatures, or by growth in weak antiseptic media, a certain type of active immunity may be conferred. This principle is made use of in Haffkine's anti-cholera injections. In the sera used in combating the plague and in immunization against typhoid, injections of the dead bodies of bacteria are practised. Finally active immunity may be induced by the injections of filtered bacterial toxins. These three types of treatment apply the principle of prevention, however. They are meant to so enhance the protective agencies of the blood serum that infection shall not take place. They are not in any sense of particular service after the disease has once begun. They are only the first stages in the development of a curative blood serum. As illustrations of these methods the following may be mentioned: (1) Pasteur's preventive inoculations against anthrax in sheep—highly successful. The immunity lasts about a year (see ANTHRAX). (2) Jenner's vaccination against smallpox (see SMALLPOX and VACCINATION). (3) Haffkine's anti-cholera inoculations. Large bodies of men in India have been inoculated first by an attenuated virus, then by a strong virus. The results thus far are not conclusive, but they are encouraging (see CHOLERA). (4) Haffkine's anti-plague inoculations. (See PLAGUE, BUBONIC). In this the dead bacteria of the plague and their toxins are injected. These are prepared in a specified manner. According to recent reports of the Indian Commission the results are highly satisfactory, but better methods for standardizing the dosage are desirable. Other methods of combating the plague after it has attacked the body are in vogue. These belong to the section on passive immunity modes of treatment. Yersin and Lustig have developed these sera. (5) Wright's anti-typhoid inoculations. In these dead bacteria and their toxins are also used. The results reported from time to time are encouraging. In India of 4,502 soldiers inoculated only about 1 per cent contracted the disease, whereas of 25,000 uninoculated soldiers in the same station 2.5 per cent contracted the disease. In the Spanish War typhoid fever was a scourge, in the recent World War the use of anti-typhoid vaccinations practically wiped out the disease, as effectively as the smallpox vaccinations wiped out that disease. (See TYPHOID FEVER). (6) Pasteur's method of treatment of hydrophobia is an application of these same principles. In this the body is slowly immunized by using modified virus grown in a special medium, the spinal cord of dogs or rab-

bits, and before the actual infection takes place, immunity is effected during the incubation period of the disease. (See HYDROPHOBIA). (7) Maragliano's anti-tuberculosis vaccination. This is one of the recent (1904) efforts to confer immunity in this dread disease. The investigator after a number of years of experiment both in laboratories and in hospitals believes that it is possible to produce a specific therapy for tuberculosis. He has been able to immunize lower animals against the disease and his methods offer much hope for successful human immunization. The main principle of Maragliano's therapy is to create a peripheral focus of tuberculosis inflammation without living tubercle bacilli and bring about by this means the active production of defensive materials. These defensive materials are antitoxins, bacteriolysins and agglutinins. It is yet too early to pronounce upon Maragliano's success, but his studies have served to reawaken a keen interest in the serum treatment of this disease which by reason of many failures had almost become despondent. The good work done by Trudeau in this country long ago began to bear fruit under many different forms, although as yet no secure immunization against tuberculosis has been accomplished. Anti-meningococcus serum for cerebro-spinal meningitis has been effective and a possible serum for poliomyelitis is now being perfected (1919). It is needless to point out that all of these advances have come through the honest workers in the medical profession. Secret commercial enterprises are notoriously unreliable and border on quackery if not criminality. All of the methods which have just been enumerated are prophylactic rather than curative. They seek to prevent the diseases in question. The use of antitoxic and anti-bacterial sera—serum therapy in the narrow sense—is meant to be distinctly curative of the conditions after infection has definitely taken place. Technically speaking these sera bring about what is known as passive immunity. At the present time two distinct kinds of sera are being used. (1) Antitoxic sera and (2) Anti-bacterial sera. In both of these anti-bodies are developed in the serum of another animal. (1) The antitoxic sera are the most promising—that for diphtheria (q.v.) having been proven to be the most efficient. Concerning its value there is at the present time almost no doubt. A great reduction in the mortality of diphtheria has resulted since the beginning of its use by Behring in October 1894. Anti-diphtheritic serum is developed in the horse. The process of manufacture is described elsewhere. It is important that in practice the serum should be used early in the disease, as it has been shown that the mortality is only about 7 per cent when treatment has been begun on the first or second day, while after the fifth day it seems to be of little service. The amount to be given is very difficult to determine. The other most important antisera are for streptococcus poisoning (blood poisoning), for tetanus, for plague, for pneumonia and for snake bite. Others may in time be developed. In the treatment of acute tetanus (lockjaw), the results have not yet proven absolutely satisfactory; some patients have seemed to be benefited, others not. Two sera are in use. (1) Behring and Roux; (2) Tizzoni. It seems that the latter serum is the

more successful. Some have ascribed this to a diminished virulence of the tetanus organism in Italy. A serious bar to a successful therapy is present in this disease in the great resistance shown by the nerve-cells to the diffusion of the serum. To obviate this, intraspinal and introcranial injections have been practised. The results have not yet proven entirely satisfactory.

The anti-streptococcic sera are in the experimental stage only. Just why results have not been obtained is not yet clear, but there are many different kinds of these streptococci and it may be that each form has its own particular type of poison that can be counteracted only by a serum developed with a similar form. The subject is slowly emerging from a highly technical condition and better results may be hoped for. Very striking effects have been obtained from some of the anti-venom sera, particularly in treating the cobra poisoning, by Calmette's serum, but the subject is still in the experimental stage. Anti-pneumococcic sera are beginning to be available. These will constitute a great blessing when they finally are evolved. The natural history of pneumonia and the known characters of the various types of pneumococci offer considerable hope for conquering this dread disease. Certain types of pneumonia are amenable to their use with success.

True bacteriolytic sera have not yet been devised as specific means of therapy. Such sera, as Yersin's anti-plague serum, which have been made, are thought to act partly as anti-toxic, partly bacteriolytic sera, but all of the details are not yet available. Very recently the suggestion has come from Ehrlich that immunity to protozoan diseases is possible. Summarizing the results then of serum therapy it may be said that (A) active immunity can be imparted with great hope of success in smallpox, rabies and anthrax, in animals; in cholera, typhoid, plague. That curative antisera are of positive value in diphtheria and snakebite, and that hopeful results have been obtained in tetanus, plague dysentery, pneumonia, blood-poisoning (streptococcus), meningitis, poliomyelitis, some forms of streptococcus poisons. Further studies may bring more into both the hopeful and positive class. See BACTERIA; BACTERIOLYTIC; IMMUNITY; INFECTION; PATHOLOGY; TOXIN AND ANTI-TOXIN; TOXICOLOGY.

Bibliography.—Wassermann, 'Immune Sera' (1904); Waldheim, 'Die Serum-Bakterientoxine und Organ Präparate' (1901); Encyclopedia Medica Article, 'Therapeutics—Serum Therapy'; Stedman, 'Reference Handbook of Medical Sciences'; Zinser, 'Immunity'; Vaughan, 'Immune Sera,' in special journals devoted to the subject, the 'Journal of Immunology' being one of the most recent.

SMITH ELY JELLIFFE,

Editor 'Journal of Nervous and Mental Diseases.'

SERVAL, a large African wildcat (*Felis serval*), yellowish in color, long-legged and thickly spotted with blackish, which also appears as bars on the legs and rings around the tail. It may exceed three feet in length, besides 15 inches of tail. Its fur is highly valued for its beauty. A smaller species or variety

(*F. servalina*) is called by Mivart the servaline cat. Consult Mivart, 'The Cat' (1892).

SERVANTS. See FAMILY LAW.

SERVANTS OF MARY. See ORDERS, RELIGIOUS.

SERVETUS, sér-vē'tūs, Michael (properly **MIGUEL SERVETE**), Spanish scholar: b. Tudela in Navarre, 1511; d. Geneva, 27 Oct. 1553. He was the son of a notary, who sent him to Toulouse for the study of the civil law. Excited by the discussions of the Reformers in that city, he began to give his attention to theology, and having formed views of the Trinity antagonistic to the orthodox doctrine, removed to Germany and there printed a tract, entitled 'De Trinitatis Erroribus' (1531), which production was followed next year by his 'Dialogorum de Trinitate Libri Duo.' But he found that the expression of his opinions was obnoxious in Germany, and made his escape to France, under the name of Michael of Villa Nueva. He engaged for some time with the Frellons, book-sellers of Lyons, as corrector of the press, then went to Paris, where he studied physic, and graduated as doctor. At Paris Servetus met Calvin for the first time, and after several meetings an arrangement was made for a theological discussion between them, but Servetus failed to appear. Soon after he quarreled with the medical faculty at Paris, and quitted the city (1538). He first repaired to Charlieu, near Lyons, where he practised three years. In 1538 Servetus published his matured theological system, without his name, under the title of 'Christianismi Restitutio.' The magistrates of Vienna ascertained the name of the author, and Servetus was committed to prison, whence he contrived to escape. Purposing to proceed to Naples he took his way through Geneva, where he was apprehended by the magistrates on a charge of blasphemy and heresy. In order to ensure his condemnation his various writings were sifted for accusations. The magistrates of Geneva were, however, aware that many eyes were on them in respect to this extraordinary treatment of a person who was neither a subject nor a resident, but, properly speaking, a traveler kidnapped in his passage. They thought proper, therefore, to consult the magistrates of all the Protestant Swiss cantons, who, referring the matter to their divines, the latter unanimously declared for his punishment, Calvin being especially urgent and emphatic as to the necessity of putting him to death. As he refused to retract his opinions, he was condemned to the flames, which sentence was carried out. Servetus is numbered among the anatomists who made the nearest approach to the doctrine of the circulation of the blood, as appears from a passage in his 'Restitutio Christianismi.'

SERVIA. See SERBIA.

SERVIAN LANGUAGE AND LITERATURE. See SERBIAN LANGUAGE and SERBIAN LITERATURE.

SERVICE-BERRY, one of the common names applied to the rosaceous genus of shrubs or small trees *Amelanchier* (q.v.). There are several species in the north temperate zone, the American ones differing chiefly in habit and in foliage. The leaves are alternate and simple,

either toothed or entire, and the five-parted flowers have delicate white petals and are solitary, or more usually in racemes, succeeded by fruits like tiny purplish apples or pears. The species are generally small shrubs, but the *A. canadensis* and *A. botryapium*, the shadbushes and juneberries of the eastern United States, occasionally arrive at the dignity of small trees, with hard brown wood. These are the first shrubs to bloom in the East (while the shad are running), and cover themselves with feathery elongated tassels of fugacious petals, while the leaves are still folded. The haw-like fruits, of somewhat insipid flavor, seldom reach maturity, as they should in June, for then the birds are too fond of them to wait for their ripening. This circumstance militates against the proposed cultivation of the juneberry.

A. alnifolia is the well-known service-berry of western America, frequently mentioned by explorers of the Rocky Mountain region. The purple, rich, although insipidly sweet, berries are about the size of a pea, with a large mucilaginous seeds. They form a favorite food of the aborigines, who cook them or dry them, and add them to dried meat, to flavor pemmican. They grow upon bushes 2 to 12 feet high, with glabrous thick alder-like leaves, nearly orbicular and coarsely toothed. The wood itself is very hard and tough and is used by the Indians for arrows and pipe-stems.

The fruit of the white beam-tree (*Sorbus aria*) is also called service-berry. See also AMELANCHIER.

SERVICE MEN OF THE SPANISH-AMERICAN WAR, an association organized at Lexington, Ky., 5 Nov. 1898. The founders of the society made choice of the designation "service men" as equally distinctive of the men who waited in vain for orders to go to the front, and the more favored ones who lived through the exciting scenes of actual conflict. In the list of charter members are to be found the names of many of the most prominent officers in the army during the war with Spain. They represent all sections of the United States and all shades of political belief, and constitute a guarantee of the permanence of the organization.

SERVICE-TREE, a round-headed, slow-growing European tree (*Sorbus domestica*) of the *Rosaceæ*, attaining a height of perhaps 60 feet. When without flowers or fruit, it is easily confounded with the ash, having pinnate leaves; but the glutinous winter buds help to identify it. The small whitish flowers are numerous, and gathered in panicles at the end of the branches, being succeeded by small rounded or pear-shaped fruit, which is only edible when in a state of incipient decay, being astringent while unripe. The wood is hard, solid and fine-grained, and takes a high polish. It is much in demand for fine cabinet making, for turning and especially for the screws of wine presses; and is very dear. The service-tree is occasionally cultivated.

SERVISS, Garrett Putnam, American author and journalist: b. Sharon Springs, N. Y., 24 March 1851. He was graduated from Cornell University in 1872, and from Columbia Law School in 1874. He was editorial writer on the *New York Sun* until 1892, and has since lectured upon history and astronomy. Among his

published works are 'Astronomy with an Opera Glass' (1888); 'The Conquest of Mars' (1898); 'Other Worlds' (1902); 'The Moon' (1907); 'Astronomy with the Naked Eye' (1908); 'Curiosities of the Sky' (1902); 'Round the Year with the Stars' (1910); 'The Moon Maiden' (1915).

SERVITES. See ORDERS, RELIGIOUS.

SERVITUDE, the state or condition of a serf, slave or bondman; state of voluntary or involuntary subjection to a master or employer; service; slavery; bondage; position in life of a servant; — hence, a state or condition of slavish or helpless dependence; as, marriage with rich and ugly old women is splendid servitude. In civil law, the right to the use of a thing, without property in the same, for all or for some particular purposes. It consists either in the right to do some act, as to gather fruit from the estate, or to prevent the owner of the property from doing certain acts, as building walls beyond a certain height, blocking up a window, etc.

SERVIUS, Honoratus Maurus, Roman grammarian. He lived at Rome toward the 4th century A.D., and wrote a commentary on the Grammar of Donatus; some lesser grammatical brochures; and a commentary on the poems of Virgil which an unknown author enlarged and enriched with notes of an antiquarian, historical and mythological character. Consult Thilo and Hagen, 'Servii Honorati Opera' (1878).

SERVIUS TULLIUS, sér'vī-ūs tŭl'i-ūs, sixth king of Rome: d. 534 B.C. He was the son of a slave, but traditions of his descent vary, some declaring his mother to have been an ordinary slave, and others stating her to have been a noble captive of Tarquin. He was given to the queen Tanaquil, and educated in the palace of the monarch, where he became so great a favorite as to receive the daughter of Tarquin in marriage. On the death of Tarquin in 578 B.C., Servius, who was immensely popular with both populace and soldiery, was raised to the throne. His reign is singularly free from wars, Livy mentioning but one, and that against the Veii, brought to a speedy termination. His greatness lay in the establishment of civil rights and institutions. He established the census, extended and beautified the city, taking within its limits the hills Quirinalis, Viminalis and Esquilinus, and building around the city a stone wall which bore his name. He greatly improved the condition of the common people, thereby gaining the enmity of the patricians, whose long-accustomed privileges were thus encroached upon, and in 534 Servius was killed as the result of a patrician conspiracy. Another tradition makes him the victim of an ambitious daughter, Tullia, who caused the death of her husband, sister and father in order to pave her way to the throne as the wife of Tarquin, son of the former king. Consult Niebuhr, 'Roman History and Critical Examinations of the History of Tarquin and Servius.' See also ROME, HISTORY OF.

SERVUS SERVORUM DEI (servant of the servants of God), a title which the popes give themselves. It was used by the Roman pontiffs at an early period, although Paulus

Diaconus states that Gregory the Great (590–604) was the first to adopt it.

SESAME, a rough-hairy, gummy annual plant (*Sesamum indicum*) about two feet high, with petiolate, ovate-lanceolate leaves, opposite below and alternate above, slightly toothed, and mucilaginous. The flowers are solitary in the axils, pale or rose-colored, five-parted, with irregular-lipped corolla, having the tube curved downward and dilated above the oblique base. Sesame has been known from ancient times, originating in the East, where it is cultivated for the sake of its black or white seeds. It is easily grown, does not object to poor soil and has even been introduced to gardens in America, for the sake of the leaves, which in infusion are employed as a demulcent medicine for infantile dysentery. The plant has run wild in the Southern States.

The seeds are very tiny, but are sweet and oleaginous, and are much used for food by Oriental peoples, and are imported into Europe for crushing. They will yield half of their weight in oil, which is yellow, limpid, inodorous and keeps for years without becoming rancid. It is of great economic value, second only to coconut oil in the variety of its uses, and can be employed instead of olive oil in very many ways, as for culinary purposes, food, medicine (having a laxative effect), cosmetic, illumination, lubrication, soap-making, etc. It is also employed as an adulterant for olive-oil, but is itself adulterated with peanut-oil. It is known as bene or benne and as gingil-oil. The cake left after the oil has been expressed forms a food for the poorer classes, and is a good food for cattle.

SESAMOID BONES, certain rounded bodies, at first cartilaginous and then bony, found in the tendons of muscles. They derive their name from their resemblance to sesame. The patella or knee-cap is a sesamoid bone. Another is developed in the upper joint of the thumb, and at the corresponding joint of the great toe, these increasing the leverage of the short flexor muscles of the thumb and great toe respectively. In the great majority of mammals sesamoid bones are much more numerous than in man.

SESHA, sā'shā, an imaginary serpent which, when coiled up, is the Hindu emblem for immortality. It is represented in Hindu mythology as having 1,000 heads, on one of which the world rests, and Vishnu reclines on this immense reptile in the primæval waters.

SESOSTRIS, sē-sōs'trīs, the name given by Greek writers to a king of Egypt, about whose identity there is much controversy, while it seems certain that the achievements attributed by the Greeks to Sesostris were the deeds of a number of Egyptian rulers. By many Sesostris is believed to be identical with Rameses II, the son of Seti (the Sethos of Manetho), and the third king of the 19th dynasty. The name of Sesostris is explained as a corruption of Sestisura, the popular appellation of this Rameses, or of Sethosis (written by Pliny Sesothis), meaning son of Sethos, by which name the same monarch is designated in Manetho. Others think that the Greek Sesotris may be a corruption of Secortesén or some similar form, which is the name of one king of the 3d dynasty and three others of the 12th. The Sesortesen of

the 3d dynasty is called Sesostris by Aristotle. The identification of Sesostris with Rameses II has the support of Champollion, Salvolini and others, but is combated by Bunsen on the ground that some of the most striking achievements attributed by Herodotus and Diodorus to Sesostris do not belong to that Rameses. Such are the victorious expeditions into Nubia and Thrace, the immense development under him of the Egyptian navy, the division of the land and its subjection to heavy burdens. But it is generally admitted, as before stated, that the exploits of various monarchs were united by the Greeks in their accounts of the reign of Sesostris, which contain a number of fables in addition, so that it is needless to seek for complete correspondence between these accounts and the monumental records of any single reign. Many of the most remarkable deeds of Sesostris may be assigned with great probability to Rameses III, the founder of the 20th dynasty and the restorer of the power and glory of Egypt. He triumphed over the confederations formed against him by various Libyan tribes; annihilated by a great victory gained in northern Syria a league of Hittites, Philistines and other Canaanitish peoples, and of tribes inhabiting the isles of the Mediterranean, in which sea he maintained a large fleet to support his operations on land. Consult Bridge, E. A. T. W., 'A History of Egypt' (New York 1902); Sethe, 'Sesostris' (Leipzig 1900).

SESSIONS, Court of. See COURT.

SESSUMS, Davis, American Protestant Episcopal bishop: b. Houston, Tex., 7 July 1858. He was educated at the University of the South, Sewanee, Tenn., took orders in 1882, and became rector of Grace Church, Galveston, Tex. He was assistant and rector of Calvary Church, Memphis, Tenn., in 1883–87; rector at Christ Church, New Orleans, La., in 1887–91, and in the latter year was consecrated bishop of Louisiana.

SESTERTIUS, an ancient Roman silver coin worth 2½ asses (hence the name *sesquiterius*, the third a half). The sestertius was the fourth part of a denarius, and when in later times the weight of the ass was reduced, and 16 asses were reckoned to a denarius, the sestertius still retained the same proportion to the latter coin, and thus became equal to four asses. The value of the sestertius, therefore, varied with that of the denarius. About the close of the republic, when the denarius is calculated to have been worth about 17 cents, the sestertius would be worth 5 cents. The sestertius was the unit most commonly employed by the Romans in reckoning large sums of money. For sums below 1,000,000 sestertia, the ordinary cardinal numerals were used with sestertii or sestertia, as the case might be; but if the sum amounted to 1,000,000 or more a numeral in *ies*, after which *centena millia* (100,000) had to be understood, was connected with sestertium (for example, *quadragies sestertium* is 4,000,000 of sestertii, that is, *quadragies centena millia sestertiorum nummorum*). Sometimes the numeral adverb was used alone, and *decies ei dedit* signifies *decies sestertium*, that is, *decies centena millia sestertiorum*, or 1,000,000. The sestertius was often expressed by the symbol HS, which is

explained as a corruption either of IIS, that is, II, the numeral two, and S for *semis*, half of LLS, or *libra libra semis*, and as having been originally equivalent to libra or pound.

SESTINI, sās-tē'nē, **Domenico**, Italian numismatist: b. Florence, 1750; d. there, 1832. He was educated at the school of San Marco. In 1774 he left his native city and went to Sicily, where he received from Prince Biscari the commission to arrange his museum at Catania, and from this time he applied himself exclusively to numismatic studies. He published numerous books, chief among which was his 'Systema Geographicum Numismatum' in 13 folio volumes.

SESTO, sās'tō, **Cesare da** (**CESARE DA MILANO**), Italian painter: b. Sesto, near Milan, about 1480; d. Milan, about 1524. He was probably a pupil, certainly an imitator, of Leonardo, and a picture of his in the Prado, Madrid, is put down by Madrazo as a copy of that master's 'Virgin and Child.' 'La Vierge aux Balances' in the Louvre and a 'Holy Family' in the collection of Lord Monson, formerly thought to be by da Vinci, are now attributed to Cesare. He was on friendly terms with Raphael at Rome, and reproduced some of the qualities of that master's style. The mingled influence of da Vinci and Raphael is apparent in his 'Adoration of the Kings' at the Naples Museum. Other pictures of his are 'Baptism of Christ,' Scotti Gallery, Milan; 'Madonna with St. John,' Melzi Collection, Milan; and a 'Madonna' in the Brera.

SETCHELL, William Albert, American botanist: b. Norwich, Conn., 15 April 1864. He was graduated at Yale University in 1887 and took his Ph.D. at Harvard University in 1890. He was instructor in biology at Yale in 1891-95 and instructor in botany at the Marine Biological Laboratory at Woods Hole, Mass., in 1890-95. Since 1895 he has been professor of botany at the University of California. Author of 'Laboratory Practice for Beginners in Botany' (1897).

SETHITES, a sect in the 2d century that worshipped Seth, the son of Adam, as the son of God, and maintained that he had reappeared on earth in the person of Jesus Christ.

SETHOS I, sē'thōs, or **SETI**, sē'tī, Egyptian king, the second Pharaoh of the 19th dynasty; which lasted from 1462 to 1288 B.C. He was one of the shepherd race or Hyksos in the eastern part of the Delta. Distinguished for magnificence, he built the temples of Osiris at Abydos, and the hall of columns at Karnak. He established by arms the power of Egypt over a large part of western Asia.

SETON, sē'tōn, **Eliza Ann Bayley**, American philanthropist, founder of the order of Sisters of Charity of Saint Vincent de Paul in the United States: b. New York, 28 Aug. 1774; d. Emmitsburg, Md., 4 Jan. 1821. She was married to William Seton about 1794 and after his death in 1804 she was received into the Roman Catholic Church the next year, and on 22 June 1809 established at Emmitsburg, Md., a community called by her Saint Joseph's Sisterhood. In 1810 the rules of the French sisters were adopted, with modifications suited to American conditions. The society grew and prospered, and in 1850 a union with the Paris society was

effected. In 1846 the New York community became independent of the original American organization. For statistics, consult the article on the society. Consult de Barbary, 'Vie' (1868); O'Gorman, 'A History of the Catholic Church in the United States' (1895).

SETON, Ernest Thompson, American author, for some time known as SETON-THOMPSON: b. South Shields, Durham, England, 14 Aug. 1860. After a brief course at the Royal Academy, London, he spent three years in zoological study on the Assiniboine in Manitoba, published works on the 'Birds of Manitoba' and 'Mammals of Manitoba,' was made government naturalist of the province and executed for the 'Century Dictionary' more than 1,000 drawings of animals and birds. In 1890 he became a pupil of Mosler in Paris, whither he returned in 1894 to study with Ferrier, Bougereau and Gérôme. He exhibited at the Salon several drawings and paintings of wolves, his particular subjects. Among his much-read books are 'Wild Animals I Have Known' (1898); 'The Trail of the Sandhill Stag' (1899); 'The Biography of a Grizzly' (1900); 'Lives of the Hunted' (1901); 'Two Little Savages' (1903); 'Woodmyth and Fable' (1904); 'Animal Heroes' (1905); 'Life Histories of Northern Animals' (1909); 'Rolf in the Woods' (1911); 'Arctic Prairies' (1911); 'Book of Woodcraft' (1911); 'Wild Animals at Home' (1913); 'Wild Animals' Ways' (1916); 'Woodcraft Boys' (1917); 'Sign Talk' (1918). In 1902 he founded the Woodcraft League which was the precursor and in many respects the father of all the present scouting organizations. It is now confined chiefly to America but is of great and growing extent.

SETON, Robert, American Roman Catholic archbishop: b. New York, 28 Aug. 1839, a member and later head of the ancient Scottish family of Setons of Parbroath. He was graduated from the Ecclesiastical Academy in Rome in 1867, and having previously been raised to the rank of private chamberlain to Pope Pius IX, was the same year made prothonotary apostolic, later becoming dean of all the monsignori in the United States. He was rector of Saint Joseph's Church, Jersey City, N. J., from 1876-1902, in the latter year leaving for Rome. He was a lecturer at the Catholic University in Washington and at Seton Hall College, New Jersey, and in 1903 was created archbishop of Heliopolis. Under the pen-name of "Fyvie" he was for some time Rome correspondent for the *New York Times*. He is the author of 'Memoir, Letters and Journal of Elizabeth Seton' (1869); 'Roman Essays' (1882); 'The Dignity of Labor' (1893); 'An Old Family' (1899).

SETON, a skein of silk, cotton, etc., passed under the true skin and the cellular tissue beneath, in order to maintain an artificial issue. The name, which is derived from the Latin *sæta*, a bristle, stiff coarse hair, because hair was originally used for the purpose, is also given to the issue itself. To insert a seton the surgeon takes a fold of the skin between his fingers and makes an incision at the base either with a knife or with a seton needle. In the former case the seton must be inserted by means of a probe, but when a seton-needle is used that instrument carries the seton along with it. When the seton is inserted the wound

is not very tightly bandaged and allowed to remain untouched until suppuration has set in, usually the third or fourth day. After that the wound is dressed with fresh linen regularly once or twice a day, and when the seton has become hard and stiff a new one is inserted by attaching one end of the new one to one end of the old, and then extracting the latter, so that the fresh one is dragged into its place.

SETON HALL COLLEGE, in South Orange, N. J., founded in 1856 by James Roosevelt Bayley (q.v.), then bishop of Newark. It was originally in Madison, N. J., but was removed to South Orange in 1860. In 1861 it was incorporated by the legislature of New Jersey. It was named in memory of Ann Elizabeth Seton (q.v.). The first president was Bernard J. McQuaid, then bishop of Rochester, and the second Michael A. Corrigan (q.v.), afterward archbishop of New York. In 1865 the college building was enlarged, and on 27 Jan. 1866 the beautiful marble edifice was destroyed by fire. It was rebuilt and ready for occupancy in 1867. The college grounds contain 75 acres and the number of buildings is nine. The government is vested in a board of 13 trustees, of which the bishop of Newark is a member and president ex-officio. There are two courses of study, the classical and scientific. The classical course leads to the degree of bachelor of arts; the scientific course to bachelor of science. The courses of study are registered by the board of regents of the University of New York State, hence the students graduating may have entrance to the professional schools of New York. A high school, preparatory for the college, is maintained in connection with the college. Courses of lectures on literary and scientific subjects are established for the pupils, and the public is admitted free of charge. The library, which is in a building of its own, contains approximately 40,000 volumes. The college offers three full scholarships in the classical course, granted to worthy applicants by a competitive examination; they entitle the holders to board and tuition until graduated, and there is a fund to assist worthy students. The annual income is over \$90,000. The faculty numbers 20 instructors and the average annual attendance of students reaches nearly 300.

SETTER, a breed of dogs, named from their former habit of crouching or "setting," on observing the game which they are trained to hunt. In modern days, however, these dogs remain erect on coming up with the quarry, and point their nose at it as does the pointer. For the "points" of the various kinds of American setters, see DOG.

SETTIGNANO, sāt-tēn-yā'nō, **Desiderio da**. See **DESIDERIO DA SETTIGNANO**.

SETTLEMENTS, Social. See **SOCIAL AND UNIVERSITY SETTLEMENTS**.

SETTLERS AND DEFENDERS OF AMERICA, *The*, an association organized in 1899 to stimulate geographical, biographical and historical research, to publish patriotic manuscripts and records and to collect colonial and Revolutionary relics. The general offices of the society are in New York.

SEVANGA, syē-vān'gā. See **GOKCHA**, a lake.

SEVEN, a number regarded by many nations as especially sacred, mystical and symbolical. In the Bible the work of creation having been completed in six days, the Creator rested on the seventh. The three *Regalim* or pilgrim festival of the Hebrews (the Passover, the Festival of Weeks and the Feast of the Tabernacles) lasted each seven days, and between Passover and the Festival of Weeks was an interval of seven weeks. Egypt's seven years of plenty are succeeded by seven years of dearth; for seven days the waters of Egypt were turned into blood. The seventh year was a sabbatical year and the year following seven weeks of years was the year of jubilee. The golden candlestick in Solomon's temple had seven lamps. In the New Testament occur many groups of seven, as, the seven churches of Asia, seven stars, seven trumpets, seven spirits, the seven horns and seven eyes of the lamb; all these in the Apocalypse. Among the Greeks the number seven was sacred to Apollo and to Dionysos; and it held a conspicuous place in the teaching of Pythagoras, who gave it many distinctive appellations. The sacraments of the Roman Catholic Church are seven, and also the orders of the ministry in the same church, namely, four minor and three major or sacred orders. Various reasons have been given for the peculiar regard had for this number, such as that seven is a symbol of completeness, being compounded of three and four, perfect numbers, they being representable in space by the triangle and the square.

SEVEN CHAMPIONS OF CHRISTENDOM, *The*, a romance of chivalry, by Richard Johnson, entered on the 'Stationers' Register' in 1596. A second part appeared in 1608 and a third in 1616. In it are recounted the exploits of Saint George of England, Saint Denis of France, Saint James of Spain, Saint Anthony of Italy, Saint Andrew of Scotland, Saint Patrick of Ireland and Saint David of Wales.

SEVEN CHURCHES OF ASIA, *The*, a collective name applied to the churches of Ephesus, Smyrna, Pergamos, Thyatira, Sardis, Philadelphia and Laodicea (Rev. i, 11).

SEVEN CITIES, *The*, a name applied to Egypt, Jerusalem, Babylon, Athens, Rome, Constantinople and either London or Paris. They are often grouped under this title, as embodying wealth, antiquity, greatness and magnificence.

SEVEN DAYS' BATTLES, a series of battles which began 25 June 1862 by the advance of a part of General McClellan's army, with a view to securing a more advantageous position for a general advance upon Richmond. McClellan's army, numbering 92,500 men, was within a few miles of the city, which was defended by General Lee with an army, including Jackson's command, of 80,762 men. The advance brought on the battle of Oak Grove (q.v.), in which the loss was moderate and with no particular advantage to either side. On the next day McClellan was thrown upon the defensive by the approach of "Stonewall" Jackson toward his right flank beyond the Chickahominy and by Lee's movement upon it. Lee threw the three strong divisions of A. P. Hill, Longstreet and D. H. Hill across the Chickahominy to co-operate with Jackson, but,

without waiting for him to get up, attacked General McCall's division of Pennsylvania Reserves at Mechanicville and Beaver Dam Creek, and was finally repulsed with great loss. On the 27th McCall was withdrawn, Jackson made connection with Lee and the combined Confederate forces attacked Fitz-John Porter's corps and McCall's division, later reinforced by Slocum's division, at Gaines' Mill (q.v.), the result being a bad defeat for the Union forces, Lee's losses, however, in killed and wounded, being about double that of Porter. Porter retreated across the Chickahominy and McClellan started on his retreat or change of base to James River. Lee pursued, and on the 29th fought the two battles of Peach Orchard and Savage Station (qq.v.), both of which were drawn battles, although in both cases the Union troops withdrew from the field to continue the retreat which they had successfully covered. On the 30th, part of the Union army and nearly all Lee's army fought the bloody battle of Glendale (q.v.), the Union army holding the ground until after dark, covering the passage of the trains and defeating all of Lee's persistent efforts to break and destroy it. The last of the seven days' battles was fought at Malvern Hill (q.v.) 1 July, resulting in a bloody repulse for Lee, and that night the Army of the Potomac withdrew to Harrison's Landing on James River. "General Lee's plans in the Seven Days' fight," says General Longstreet, "were excellent, but were poorly executed." In an official report General Lee says: "Under ordinary circumstances the Federal army should have been destroyed." That it was not destroyed is due to the skill of McClellan in conducting the retreat, but more to the fighting quality of his subordinate officers and their men. The Union loss (25 June to 1 July) was 1,734 killed, 8,062 wounded and 6,053 captured or missing. The Confederate loss was 3,478 killed, 16,261 wounded and 875 captured or missing. See PENINSULA CAMPAIGN OF 1862.

SEVEN GIFTS OF THE HOLY GHOST: Wisdom, understanding, counsel, fortitude, knowledge, piety and the fear of the Lord. They are enumerated in Isaiah xi, 2, as rendered in the Septuagint, the Latin Vulgate and their versions: in the Douai English version the passage reads: "The Spirit of the Lord will rest upon him; the spirit of wisdom and understanding, the spirit of counsel and strength, the spirit of knowledge and piety, and the spirit of the fear of the Lord will fill him." With this the Authorized Version agrees save that after "knowledge," this only follows "and of the fear of the Lord"; and the Hebrew, too, has nothing answering to "piety."

SEVEN-HILLED CITY, a name applied to Rome.

SEVEN HUNTERS, The. See FLANNAN ISLANDS.

SEVEN LAMPS OF ARCHITECTURE, The, a treatise on architecture by John Ruskin, published in 1847. In this book architecture is regarded as the revealing medium or lamp, through which flame a people's passions and which embodies their life, history and religious faith, in temple, palace and home. The first lamp is "Sacrifice," next comes the "Lamp of Truth," the third and fourth lamps are those of "Power" and "Beauty." The fifth is the

"Lamp of Life," and the last two lamps are those of "Memory" and "Obedience." Ruskin affirms that "the architecture of a nation is great only when it is universal and established in its language, and when provincial differences in style are nothing more than so many dialects."

SEVEN PINES, Battle of. See FAIR OAKS, BATTLE OF.

SEVEN SAGES. See SEVEN WISE MEN.

SEVEN SEAS, The, by Rudyard Kipling, a collection of verse containing several of the author's most vigorous and characteristic poems, was originally published as a separate volume in November 1896. It has also been included, under the same name as a subtitle, in a larger and more comprehensive collection, entitled 'Verses.' While 'The Seven Seas' is not limited in range, containing, as it does, poems on many themes—virile songs in stirring rhythms, such as 'The Last Chantey,' striking character portraits like that of the grim old shipowner of *The Mary Gloster* and of 'the dour Scots engineer' of 'McAndrew's Hymn' and 'The Last Rhyme of True Thomas' and other lyrics and ballads of a high order—still, the dominant note, sounded especially in 'A Song of the English,' is a fervent, almost religious belief in Britain's world supremacy—what Paul Elmer More calls the poet's "earnest conviction that the English race, 'the Sons of the Blood,' are destined to sweep over the earth and fulfill the law of order and civilization." It was this note that caused the poet to be hailed the unofficial laureate of the British Empire. Kipling's frequent use of colloquialisms and slang, however appropriate when his speakers are such careless folk as soldiers and sailors, have led some critics to disparage his claims to the laurel. Yet his eager revelation of the charm and beauty inherent in "things as they are," is precisely what endears him the most. As Charles Eliot Norton says: "The poet finds to-day as entertaining as any day that ever dawned, and man's life as interesting and as romantic as it ever was in old times. . . . It is enough now gratefully to recognize that he continues the succession of royal English poets, and to pay him the homage which is his due."

ARTHUR GUITERMAN.

SEVEN SLEEPERS, a Christian legend dating from the times of persecution under the empire. According to the story, in the reign of Emperor Decius, when the Christians were persecuted, it is said that seven noble youths of Ephesus concealed themselves in a neighboring cavern, the entrance of which was closed by order of the emperor. The persecuted youths immediately fell into a deep slumber, from which they were accidentally awakened in the reign of Theodosius II, after the lapse of about two centuries. Pressed with hunger after their long fast, they sent one of their number to the city to purchase bread. He was astonished to see crosses erected all over the city and his own antiquated dress and obsolete language confounded the baker, to whom he offered an old medal in payment for bread. Suspected of having found a secret treasure, he was carried before the judge, to whom he related his miraculous story. The bishop of Ephesus, the magistrates and the emperor him-

self, hastened to the cave and found the sleepers still bearing the bloom of youth. They related their story to the multitudes, gave them their benediction and expired.

SEVEN STARS. See **PLEIADES**.

SEVEN-UP, a game of cards, sometimes called "all fours" from the four points (high, low, jack and game) that are at stake.

SEVEN WEEKS' WAR, the Austro-Prussian War of 1866, which grew indirectly out of the long-continued rivalry of the Prussian and Austrian nations and was finally precipitated by the Schleswig-Holstein controversy. Prussia's support came from the majority of North German states and from Italy, while the South German states and Nassau, Frankfurt, Hanover, etc., gave their assistance to Austria. Under Moltke the Prussians won victories in rapid succession, and in an astonishingly short period had outfought the Austrians, who met their final defeat in the battle of Königgrätz or Sadowa, 3 July after only about seven weeks of actual fighting. The negotiations at Nikolsburg, 26 July, were confirmed by the Peace of Prague and other acts of formal settlement, and the prestige of Prussia, greatly increased, was made dominant in the Franco-German War which soon followed. See **AUSTRIA-HUNGARY**; **GERMANY**; **PRUSSIA**.

SEVEN WISE MASTERS, a collection of tales which originated in the East. The plot connecting the tales is the following: A king's son, who had been instructed in all branches of knowledge by seven wise masters, finds by the study of the stars that he is in danger of meeting his death if he utters a word within seven days. At the very beginning of this period his stepmother urges her husband to put his son to death, at the same time telling him a story calculated to induce him to do so. The king is just about to act on this advice when one of the seven wise masters obtains a day's respite for the prince by telling a tale, the moral of which counteracts that of the stepmother. On each of the following six days during which the prince's danger binds him to silence, the stepmother renews her solicitations to the king to have the prince put to death, on each occasion supporting her advice by a fresh story, but the effect of the stepmother's tales is always counteracted by another told by one of the seven wise masters, until the expiration of the seven days enables the prince to reveal the designs of his stepmother. The date and circumstances of the origin of this collection of tales are unknown. The plot of the work is in fact found in Buddhist literature, not as a fable but as a real event, but no Indian original of the collection of tales has been discovered. The tales were without doubt introduced into the West through the Crusades, since which the collection has been translated into almost all Western languages.

SEVEN WISE MEN, or **SEVEN SAGES, OF GREECE**, the collective designation of seven ancient philosophers and sages, namely, Solon of Athens, Thales of Miletus, Pittacus of Mitylene, Bias of Priene, Chilon of Sparta, Cleobulus of Lindus and Periander of Corinth; they all lived between 620 and 548 B.C.

SEVEN WONDERS OF THE WORLD.

Within the sovereignty of Turkish soil, as it stood at the beginning of the European War of 1914, were included six of the original Wonders of the World, about which so much has been written, until it is hard to distinguish between history and fable. The exception was the Colossus of Rhodes which stood on Greek territory. Of all these wonderful creations only two survive and in a more or less damaged state—the vocal Memnon and the Pyramids. The former term is applied to one of the two colossal statues, each nearly 70 feet high, of Amenophis III, near Thebes, two of which still remain. In the case of the more northerly of these, partly overthrown by an earthquake (27 B.C.), it was noticed that at early morn it gave forth a curious sound, resembling a cry, which was supposed to be the response of Memnon, son of the Dawn or Eos, to his mother, and formed the subject of varied interpretation by ancient sages and modern writers in folklore. But early travelers, who heard the sound, never solved the mystery, which was simple enough—it was merely the passage of air through the pores of the broken reddish sandstone, due to the change of temperature at sunrise. Not the first or last of ancient miracles to be as easily solved after ages of wonderment. But the musical sounds are no longer heard since Septimus Severus repaired the breach in the sandstone. More useful was the second wonder—the lighthouse or Pharos, built by Ptolemy Philadelphus (200 B.C.). It was erected on a long narrow rock in the harbor of Alexandria, a mile off shore, and was inscribed "King Ptolemy to the gods, the saviors, for the benefit of sailors." Many traditional details of doubtful authenticity have come down to us as to its height, surpassing the loftiest of pyramids, the mirrors employed as reflectors, the fire kept burning nightly at its top, and the architect's scheme for immortalizing his name by cutting it in the structure and covering the huge letters with plaster. Long before our modern school gardens, Nebuchadnezzar reared the Hanging Gardens of Babylon for his wife's pleasure. They consisted of a series of five terraces of sun-dried brick and were raised each 50 feet above the other, to the height of 250 feet. The labor of thousands of slaves was conscripted in its construction. A winding stair led to the queen's paradise on top, the terraces were exquisite gardens with the rarest and most beautiful plants. There were flowery fountains, tame animals disported at ease through the meadows, and the structure became one of the ancient world's wonders. Next comes the magnificent Temple of Diana at Ephesus, scene of orgies as well as of worship, and set on fire by Erastosthenes, who sought thereby to gain renown. Rebuilt by the Ephesians, after declining Alexander's aid, it surpassed the glories of the original fane, with its main altar by Praxiteles, its columns of porticoes 60 feet in height, its length 405, its width 220 feet, all of white marble, elaborately adorned with gold and filled with statues and works of art. First despoiled by Nero, it was destroyed by the Goths. A widow's tender thought of her husband supplied one of the wonders. Upon the death of Mausolus, king of Caria, his

widow, who died of grief 350 B.C., built his tomb, which must have been of rare magnificence to have given its name Mausoleum to ornate graves of the dead to our day.

The pyramids of Egypt still survive as wonders. These tombs of the Pharaohs, marred by age and partly destroyed by earthquakes, arouse no less wonderment, while countless volumes have been written on their origin and history, with curious speculation as to the uses for which they were designed. The masonry of the great Pyramid of Cheops, as it is termed, has been worn out at top by time, and the sides, which once were smoothly slanting, now form a series of steps, due also to time and the elements. The legend of the Colossus straddling the harbor of Rhodes with its legs, is very picturesque but it had no other basis than popular fancy. It was in reality a huge bronze image of Appollo, about the height of New York's Statue of Liberty, 105 feet. Erected about 200 B.C. on the shore at the entrance to the harbor of Rhodes, it was overthrown by an earthquake, its fragments in later decades being bought and carried away on camels by traders of the time, ready as to-day to barter in junk. How many modern wonders of art, science and invention are likely to survive a thousand years and more, when fame to-day is as rapidly lost as it is acquired and miracles of achievement occur so often that they have ceased to be miracles?

SEVEN YEARS' WAR, a war between Prussia and other European powers (1756-63). By the treaties of peace concluded at Breslau 28 July 1742, and at Dresden 25 Dec. 1745, Maria Theresa of Austria ceded to King Frederick II six principalities of Silesia and the county of Glatz. In the hope of recovering them she concluded an alliance with Elizabeth, empress of Russia, brought over to her cause the king of Poland and elector of Saxony, Augustus III, and attempted to form a closer union with France. Meanwhile a dispute had arisen between Great Britain and France relating to their American boundary, and it broke out in 1755 into open hostilities. The king of England concluded an alliance with Prussia; and some months after France made a league with the court of Vienna. All the proceedings of the Russian, Austrian and Saxon courts were discovered to Frederick, who resolved to anticipate his enemies. In August 1756, he invaded Saxony, occupied the capital, which had been deserted by the court, Leipzig, Wittenberg and Dresden; took possession of the documents necessary to justify his conduct which he found in the archives of the cabinet in the last city, and invested the Saxon army in their fortified camp at Pirna. Meanwhile Field-Marshal Browne advanced from Bohemia with an army to liberate Saxony; but Frederick was able to check his advance, and the Saxons, 14,000 strong, were forced to surrender 15 October. The inferior officers and common soldiers were compelled to enter the Prussian service; but they soon deserted, making their escape to Poland, where the Saxon court resided during the whole war. Such was the end of the first campaign, and the Prussians remained through the winter in Saxony and Silesia. Frederick's invasion of Saxony was pronounced to be a violation of the Treaty of Westphalia, and

France, as one of the guarantors of that treaty, now took part in the struggle. Sweden and Russia adopted a similar course. In the diet at Ratisbon, held in January 1757, war was also declared on the part of the empire against Prussia.

Thus in 1757 Austria, Russia, France, Sweden and the German empire were in arms against Frederick, while he had no ally but England and a few German states (Brunswick, Hesse-Cassel and Gotha, besides, of course, Hanover). In order to be again beforehand with his enemies, Frederick (April 1757) marched into Bohemia, and on the 6th of May a bloody battle was fought at Prague, in which the Prussians conquered, but lost their distinguished general, Schwerin. The greatest part of the vanquished Austrian army threw itself into the city of Prague, to which the king immediately laid siege. But the defeat of Frederick by the Austrians under Daun, at Kollin, in the following month, 18 June, deprived the former of all his advantages. He was forced to raise the siege of Prague, and to retreat to Saxony and Lusatia. Little more than a month later, 26 July, the Duke of Cumberland, commanding the German allies of Frederick, was defeated at Hastenbeck on the Weser, in the south of Hanover, by the more numerous army of the French; whereupon the victors made preparations for taking up winter quarters with the imperial army in Saxony. The two armies had already united and advanced as far as the Saale, the French under the command of the incapable Prince Soubise, a favorite of the Marquise de Pompadour, when Frederick marched against them, and fought at Rossbach, a village between Merseburg and Weissenfels, that memorable battle, in which both the French and the imperial armies were defeated, and found safety only in a hasty flight 5 November. The defeated armies retired into winter quarters at a distance, and the possession of Saxony was secured to the king. Upon this Frederick hurried back to Silesia, which was now occupied by the Austrians. With a small army, fatigued with a long march, he defeated at Leuthen a force twice as great, under Daun, 5 December. By this victory Frederick recovered Silesia, and he was now more formidable to his foes than ever; for not only had he been victorious himself, but while he had been thus occupied in the south and west his general Lehwald had successfully repelled the Swedes and Russians on the north and east.

The third campaign was opened in February 1758, by Ferdinand, Duke of Brunswick, who was now at the head of the allied armies, in the place of the Duke of Cumberland, and opposed the French in Lower Saxony and Westphalia. His nephew, the hereditary prince, afterward Duke of Brunswick, Charles William Ferdinand, commanded under him. Duke Ferdinand made himself master of the Weser, expelled the French, under Clermont, from Lower Saxony and Westphalia, and defeated them 23 June at Krefeld. He then returned over the Rhine to Hesse, where Soubise was stationed with a French army, and whither Clermont followed him. Ferdinand, in the meanwhile strengthened by 12,000 British troops, forced the two hostile bodies to retire over the Main and the Rhine, where they went into winter quarters. Mean-

while the Russians, under Bestucheff, had advanced as far as the Oder; and subsequently Fermor, who superseded Bestucheff, occupied east Prussia, and then moved into Brandenburg, spreading devastation on his way. At this juncture Frederick made a masterly march to the Oder, and toward the end of August engaged the Russians at Zorndorf, in the north of Brandenburg, where he gained a sanguinary victory, which forced the Russians to retreat to Poland. After this he again turned his attention to Saxony, where his brother Prince Henry was no longer able to resist the Austrians. He encamped at Hochkirch, but here he was surprised by Daun in the night of 14 October and suffered a total defeat. He nevertheless succeeded with the remains of his army in effecting a junction with his brother, after which he again drove the enemy out of Silesia and Saxony. At the close of the campaign the king saw all his dominions except Prussia proper free from the enemy. In France there was a general wish for peace; but Louis XV and his mistress, the Marchioness de Pompadour, were bent on continuing the war. A new alliance was therefore concluded with Austria 30 Dec. 1758. Frederick, however, had also obtained a new treaty with Great Britain, which promised him a large yearly subsidy. Yet he determined in the coming campaign to act with his main army as much as possible on the defensive and to commit aggressive movements to detached corps.

The campaign was opened in March 1759, Prince Henry marching into Bohemia, where he dispersed the hostile forces, and captured immense quantities of military stores. He then entered Franconia, and put the inactive imperial forces to flight. At the same time the Prussian general Dohna drove back the Swedes once more to Stralsund, and managed to keep the Russians for a time in check. But when the Russians pressed forward in ever-increasing numbers under Soltikoff, Dohna found himself obliged to give way. Frederick then gave his command to General Wedel, who received orders to prevent the junction between the Russians and Austrians at all costs, and accordingly on 23 July attacked the Russians at Kay, near Züllichau, in the east of Brandenburg. His attack was unsuccessful, and the Russians after their victory advanced to Frankfort-on-the-Oder. Frederick now hastened in person to his electoral dominions, and on 12 August attacked the Russians at Kunersdorf, near Frankfort, and had already defeated them when the victory was snatched from him by the Austrians, under Laudon, who inflicted on him a defeat such as he had never before sustained. The Russians purchased their victory dearly, and they made no use of it. Yet Frederick's position was extremely dangerous; indeed, he began to apprehend an unfortunate issue of the war. The Russians were victorious in his hereditary states; Daun was in Lusatia with a large army, and Saxony was overrun by the imperial troops. The Austrians and Russians wished to unite, but Prince Henry deprived the former of their magazines, and thus obliged them to retreat; and Frederick anticipated the Russians in their march to Silesia, and compelled them to retire to Poland. In the west Frederick's allies had been more successful. They had, indeed, been able to do but little at the beginning of the campaign. The French had taken Frankfort-on-

the-Main by surprise during the winter, and the plan for recovering the city was frustrated by the failure of the attack on Bergen 13 April. But 1 August, Ferdinand gained a decisive victory at Minden over the French troops under Contades and Broglie. On the same day the hereditary Prince of Brunswick likewise defeated the French at Gohfeld, and they were driven over the Lahn on one side and over the Rhine on the other. The Swedes also, who, after the battle of Kunersdorf, when Prussian Pomerania was destitute of troops, invaded that country, were driven by Manteuffel and Platen under the cannon of Stralsund. Thus, in spite of all his mishaps, Frederick's fortunes were still in the ascendant at the end of the campaign.

The campaign of 1760 seemed at first to forbode ill success to Frederick. While he himself was engaged in Saxony, the brave General Fouqué suffered a defeat in Silesia, in consequence of which the Austrians occupied the whole land. Frederick thereupon gave up Saxony in order to recover Silesia. With 30,000 Prussians he marched into that province, and intrenched himself at Liegnitz. Here on 15 August he defeated Laudon, and thereby effected his purpose of recovering Silesia, but he was unable to prevent Austrian and Russian troops from breaking into Brandenburg and laying waste his hereditary dominions. Frederick hastened thither to cut off the enemy, but not finding them there he returned to Saxony, where the imperial forces were stationed, and Daun and Lascy had united. At Torgau, on the Elbe, he attacked the enemy 3 November, defeated them in a bloody engagement, and then went into winter quarters in Saxony. The Russians were also forced to raise the siege of Colberg and to retire to Poland. The allied forces, under Ferdinand of Brunswick, defeated the French 31 July at Marburg; but the latter remained in Hesse.

In the opening of the next campaign 11 Feb. 1761 Ferdinand attacked the French in their quarters; they fled, losing many of their fortifications and magazines. A corps of French and Saxon troops was defeated 14 February at Langensalza; but the allies were obliged to raise the siege of Ziegenhain, Marburg and Cassel with loss, and the French once more became masters of all Hesse, and had an unobstructed passage to Hanover. The proposals of peace now made by Britain and Prussia were not accepted, and Frederick endeavored to protect Silesia against the Austrians and Russians, who had united in August at Striegau. He and his allies, however, met with reverses at Schweidnitz, Colberg and elsewhere, and despite some successes (as at Villingshausen) Frederick felt himself in a desperate condition. But at the very time when Frederick's distress was greatest, Elizabeth, the empress of Russia, died 5 Jan. 1762, and her successor, Peter III, concluded with him 5 May the Peace of Saint Petersburg. Sweden likewise made peace with Prussia, and the Russian emperor sent a body of troops to aid the Prussians. But the emperor's early death broke the alliance with Frederick, and his successor, Catharine II, recalled the Russian troops from the Prussian service. Frederick, however, was delivered from one dangerous enemy, and had gained an important preponderance of strength over the rest. After recovering Schweidnitz and providing for the defense

of Silesia, he marched to Saxony. On 29 October an important victory was gained over the Austrian and imperial troops at Freiberg, and the king now concluded an armistice with the Austrians; but it related only to Saxony and Silesia. Under Duke Ferdinand and the hereditary prince of Brunswick the allies then began unsuccessfully, the campaign of 1762 against the French; but the latter were defeated 24 June at Wilhelmsthal, and driven from their fortified camp at Cassel. Cassel itself was besieged, and 1 November surrendered to the allies. Two days after this the preliminaries of peace between Britain and France were signed, and the peace itself was confirmed at Paris 10 Feb. 1763. After a short negotiation Frederick concluded a peace with Austria and Saxony at Hubertsburg, 15 February, by which each power received again all the territories it had possessed before the war. The simultaneous struggle between Great Britain and France in North America and India ended in favor of the former. See CANADA; FREDERICK II; MARIA THERESA; PITT, WILLIAM.

SEVENTEEN-YEAR LOCUST, or CICADA. This insect (*Cicada septendecim*) is black, marked with bright orange and a white spot on the head just behind the eyes. There are four glassy wings and the eyes are red. The length is about one and one-half inches. When the insect emerges from the ground after its 17 years' burial it ascends a tree trunk or other convenient object and works its body rapidly backward and forward, breaking the pupal skin, from which the winged imago emerges. The cicadas pair at once. They then congregate on the branches of the trees in sufficient numbers to bend and at times break them by their weight. The woods and orchards resound with the din of the drums from morning to night.

The females lay the eggs in the twigs and small branches of trees. They repeatedly thrust the ovipositor obliquely into the bark and wood in the direction of the fibres, at the same time putting in motion the lateral saws which detach little splinters of wood and make a fibrous lid over the whole. In each fissure made by the piercer the female deposits from 10 to 20 eggs in pairs. It takes her a quarter of an hour to prepare one nest and fill it with eggs, and she usually makes between 15 to 20 fissures in one limb. She lays between 400 and 500 eggs and then soon dies. Six weeks later the eggs

hatch. The young when it bursts the shell is grublike in form and has six legs, the first pair of which are large and claw-like, and the mouth is provided with a suctorial proboscis. After being hatched the young deliberately loosen their hold on the limb and fall to the earth. They instantly dig their way into the ground where they seek out the tender roots of plants. These they pierce with their beaks and draw out the vegetable juices which constitute their sole nourishment. They remain in the larval state for about 17 years, when they are full grown, pass into the pupal state, in which they remain but a few days, seek the surface of the ground and transform.

When a brood of cicadas is expected, no young trees should be set out for a year or two prior. The older trees are frequently able by their strength to live through the attacks. Extremely valuable shrubs and trees may be saved by being completely covered with mosquito netting, thus preventing the deposit of eggs.

For a record of broods, see CICADA; and for the musical apparatus, etc., see ORTHOPTERA.

SEVENTH DAY ADVENTISTS. See ADVENTISTS.

SEVENTEENTH CENTURY. This was a century of bitter political dissension, religious wars and ever-recurring turmoil of many kinds throughout Europe. The Huguenot wars in France during the first 30 years, the Thirty Years' War in Germany (1618-48) and the frequent wars of France with nearly all her neighbors under Louis XIV in the latter half of the century make it forever notorious. England put King Charles I to death (1649), was ruled by Cromwell for some 10 years, restored the Stuarts (1660) only to banish them in the person of James II (1688) when his Catholicity offended the realm, so as to place his Protestant daughter Mary, with her consort, Prince William of Orange, on the throne. This furnished the occasion for the drawing up of the Declaration of Rights, which the king and queen as all subsequent English sovereigns had to guarantee before their coronation, so that the Revolution of 1688 well deserves its title of "glorious" as a landmark in the progress of constitutional government.

The romantic career of Sir Walter Raleigh (1552-1618) closed tragically. As a favorite of Queen Elizabeth he went on expeditions to America, tried to found a colony in Virginia, named by him after the "virgin queen," and was one of the gentlemen adventurers of the later 16th century, well known by everyone. He lost favor in King James' time, was accused of taking part in a conspiracy against the king, for which he was imprisoned in the Tower for some 13 years, and finally, having failed in an expedition to America, was beheaded. During his long confinement he relieved the tedium of prison life by writing a 'History of the World,' of no value as history, but an interesting example of the prose and mode of thought of the time. Raleigh will always be remembered for having introduced the potato into Ireland and the use of tobacco into England. The use of tobacco was condemned by Church and State and bitterly denounced by King James I, who wrote a book against it, but spread all the faster, apparently, for that. It was supposed to be the secret of the health and vigor of the

Indians, the significance of their life in the open and their simple food being missed. Tobacco was destined to become the most popular of narcotics, almost universal in use. Only the American Indians used it in the 15th century; now it is used everywhere throughout civilization. This century saw also the introduction of coffee into Europe as well as of tea. Coffee houses became popular social centres, and tea was served in them in the latter half of the century with and without alcoholic additions. The two exotic plants and their products were destined to revolutionize social usages in many ways, and their use has gone on increasing in spite of medical and other warnings with regard to possible dangers.

The Jacobean period, named after James I (king 1603-28), who had been James VI of Scotland, the son of Mary Queen of Scots, contains Shakespeare's mature work—'Hamlet,' the Roman plays, 'Lear,' 'Macbeth' and 'Henry VIII'—a number of the plays of Ben Jonson, besides all of the dramatic product of Beaumont and Fletcher and Massinger, with most of the work of Shirley and Davenant. The latter part of the century had Dryden, Congreve and Wycherley. The Jacobean was followed by a period of Puritan literature, the supreme products of which are Milton's 'Paradise Lost,' the greatest epic in English, and Bunyan's 'Pilgrim's Progress,' the greatest English allegory, both with a high place in world literature. Milton succeeded admirably in his revival of the classic drama in 'Samson Agonistes,' but it is his shorter poems that reveal his greatness as a poet. Bunyan, a wandering tinker, confined to Bedford jail for 12 years, found the time to write his allegory, a marvelous bit of English prose and of Puritanic philosophy. He was so full of the Scriptures that his book breathes their very style. The subsequent reaction against Puritanism gave rise to the licentious Restoration drama. Even Dryden allowed his work to be tinged by the license of the time. His poetry is the greatest of the period and perhaps the greatest for two centuries after.

After Shakespeare's plays, the most important landmark in English literature of this century is the King James version of the Bible (1611). Done by a group of scholars into the virile English of the time, under the influence of the still living Elizabethan tradition, this translation fixed the language, prose and verse, for all the after time. It has had the strongest influence on nearly all the English writers, though more particularly writers of prose, and still remains what may be called the best English.

The man of the period most famous in the aftertime was Lord Bacon (Baron Verulam), Lord Chancellor of England. His 'Novum Organum' with its discussion of the inductive method brought him fame. It is recognized now that he was only one of a group of men about this time, many before him, who emphasized the value of induction in science. Some of the greatest discoveries of our modern sciences were made by the inductive method before and after Bacon's time by men who knew nothing of Bacon. Telesio stated fully the inductive method 100 years before Bacon; his great namesake Roger Bacon, as well as Albertus Magnus, Nicholas of Cusa and many

others employed it before the Middle Ages closed, and Copernicus, Versalius, Eustachius, Leonardo da Vinci, Cæsalpinus and many others had used the method of observation and experiment in the 16th century, and Gilbert and Galileo, Bacon's contemporaries, used it very successfully but quite independent of his influence. Bacon's modern fame is founded on the claim that he was the author of Shakespeare's plays. This "Baconian theory," as it is called, owes its vogue to one Delia Bacon, who claimed to be a descendant of the Lord Chancellor, and who first made the claim for him some 250 years after Shakespeare's death. The year after she was adjudged insane and never afterward recovered her sanity. The theory was not an invention of hers, as the curious delusions of the insane seldom are, but the chance suggestion of a writer on travel in Mexico who threw out the hint that it must have been a learned man who wrote Shakespeare's plays.

The literature of the century opened with Shakespeare's 'Hamlet,' "more written about than any man that ever lived" (Furness) and 'Don Quixote,' "incomparably the best novel ever written" (Macaulay). The Spanish promise was well fulfilled. Cervantes' short stories have been declared the best of their kind. Spain excelled, however, in dramatic literature. Calderon has been compared to Shakespeare (Russell Lowell). Lope de Vega (1560-1635), "a prodigy of nature," wrote more plays than any other man that ever lived. His plots at least deeply influenced writers in other countries. Alarcon, an American by birth, and Tirso de Molina, the creator of the world-type Don Juan, whose biography has been re-created in our day, for he wrote under a pseudonym, are other Spanish dramatic writers with a place in world literature. In history (Mariana), in philosophy (Suarez), in ascetics (Rodriguez) as well as in theology (Molina) and grammar (Alvarez), the Spanish writers of this period, are famous and their works have been republished many times.

The century contains the "Golden Period" of French literature. Richelieu founded the French Academy (1635), and this gave a great impetus to the cultivation of the French language. Louis XIV was most liberal in his patronage of Frenchmen of letters, and his was a real Augustan Age, with a great many of the literary men of the time ready to sing the praises of the king because of his generous patronage. The political glory of Louis' reign and the many French victories in war stimulated the French imagination with magnificent literary results. France's crowning prestige in this period made the French literature of very far-reaching influence. Latin gradually ceased at this time to be used as a common language in diplomatic and scientific circles. French replaced it, so that everyone in Europe who had any pretensions to education knew French besides his mother tongue, and was interested in French literature. It is not surprising, then, that under the stimulus of a world audience every mode of French literature developed in wonderful fashion. Corneille, Racine and Molière are the great dramatic poets, worthy of a place beside the dramatists of any other time or country; Descartes and Pascal, the philosophical writers who have deeply in-

fluenced all the succeeding generations; Boileau and La Fontaine the poets, still widely read after nearly three centuries; Bossuet, Bourdaloue and Flechier the orators, among the greatest of history; La Rochefoucauld and La Bruyère as moralists are still living forces, and La Rochefoucauld is almost more quoted than any author since his time. Fenelon has a place by himself and it is very high. The period also saw the development of a school of romance, mainly of women writers. Madame de Sévigné wrote French prose while coteries of immortal French literary ladies made literature a fashion, though little of their work has survived. Mademoiselle de Scudéry's writings had an immense vogue and probably suggested the comic romance of Scarron and some other romantic developments. Madame de la Fayette wrote in the 'Princess of Treves,' a story that anticipates our modern fiction in many ways.

Three philosophers who have notably affected human thinking ever since wrote at that time. Descartes (1596-1650), who probably has influenced modern philosophy more deeply than any other, was distinguished as a mathematician, but put that aside to spend 20 years in retirement in Holland (near Leyden) elaborating his system of philosophy. He began by doubting everything, even his own existence, but his "I think, therefore, I am," became for him the foundation of certitude. Spinoza (1632-77) was the greatest modern expounder of Pantheism. He was descended from Portuguese Jews and made his living as a lens-grinder in Amsterdam. His metaphysical speculations were founded on Descartes, who had gone into philosophic retirement not far from where Spinoza also retired when he gave up his occupation to write out his Pantheistic theories. Pascal (1623-62) was like Descartes, first a mathematician and then a philosopher. He is famous for his prose style. He died before his *magnum opus*, an apology for Christianity, was completed. All that we have of it is the 'Pensées,' thoughts on great subjects.

The century proved a great period in the history of mathematics. Kepler succeeded Tycho Brahe as mathematician-astronomer to the Emperor Rudolph (1602). In working out Tycho's observations he deduced the great laws that bear his name. Galileo's discoveries opened further occasions for mathematics. Cassini's tables of the motions of Jupiter's moons led to his invitation to the observatory in Paris, and the Cassinis continued for generations as successful workers in astronomy and mathematics. Descartes and Pascal graduated from mathematics into philosophy and carried the modes of their previous discipline into the new sphere of thought. The Bernoullis, Jacques and Jean were followed in succeeding generations, like the Cassinis, by great mathematicians. Jacques Bernoulli (1654-1705) solved the isoperimetrical problem and discovered the properties of the logarithmic spiral. The two greatest mathematicians of the century are Leibnitz (1646-1716) and Newton (1642-1727). Leibnitz was the inventor of the differential and integral calculus (independently discovered by Newton), and was also a writer of influence on philosophy. Newton's astro-

nomical mathematics, depending on the determination of the length of a degree on the earth's surface by Picard in Paris (1671), made him famous. His 'Principia Mathematica' was presented to the Royal Society (1686) and published the following year.

The name of the period around which ever-recurring controversy has centred is that of Galileo (1564-1642) the physicist-astronomer. He invented the thermometer, discovered the isochronism of the pendulum and the hydrostatic balance and the barometer. His great invention was the telescope, with which he discovered Jupiter's moons (1610). For teaching in opposition to all the mathematicians and astronomers of his time that the Copernican theory is the only tenable doctrine of the heavens though his reasons for it have all since been contradicted, and Copernicanism is now held on entirely other grounds. Galileo was compelled by the Inquisition to abjure his Copernican teaching in 1633. He was disciplined but *not* imprisoned, and prominent ecclesiastics continued to be his friends. "His long life considered as a whole was one of the most serene and enviable in the history of science" (Bertrand, Perpetual Secretary Paris Academy of Science). His trial at Rome has been taken as the symbol of Church opposition to science, but as it is practically the only case in some six centuries, Cardinal Newman emphasized the fact that it had just the opposite significance, and was the exception which proved the rule of Church relations to science as favorable. Galileo himself continued to be a faithful and even devout Catholic.

The century stands out in the history of art, with two of the greatest artists of all time—Rembrandt (1607-69) and Velasquez (1599-1660). Admiration for the work of these men has grown ever since. A series of great painters, besides Rembrandt in the Netherlands and the contemporaries of Velasquez in Spain, are noteworthy. Rubens (1577-1640) did his best work in this century, and his pupil Van Dyke (1599-1641) belongs entirely to it. His greatest work was done in the fourth decade of the century in England. Ruysdael, Hobbema, Paul Potter, Vermeer, Teniers and others maintained the primacy of the Netherlands in painting during this century. Besides Velasquez there were in Spain many who reached distinction and that distinction has grown in recent years. The best known among them are Zurbaran, Murillo and Ribera. In France, though the French were under the influence of the Italians, such names as Nicolas Poussin and Claude (Lorrain) are forever famous.

Sweden came to occupy a very important place in European politics during this century. King Gustav Adolf (Gustavus Adolphus) intervened in the Thirty Years' War to prevent the further aggrandizement of the Hapsburgs. The Swedes looked upon the Baltic as a Swedish lake and their supremacy seemed imperiled. After the fall of Magdeburg, 1631, when that city was stormed by Tilly and given up to pillage, the Protestant princes of Germany, alarmed, united with the Swedish king. Tilly was defeated at Breitenfeld (Leipzig) 1631, and again the following year, when he was fatally wounded. The emperor had to turn to Wallenstein, who had been in disgrace. Under him a

battle was fought with the Swedes at Luetzen in Saxony, which the Swedes won, but at the fatal price of their king. Wallenstein fell under the suspicion of the emperor who caused him to be assassinated (1634). After this the later part of the Thirty Years' War became a political struggle between the house of Bourbon and the house of Austria, though for a time it had seemed to be a war on religious grounds between Catholics and Protestants. The Treaty of Westphalia, which ended the war, established the principles of balance of power in Europe, which has been the source of so much disaffection and so many wars since.

On the death of Gustavus Adolphus, his daughter Christina, but six years old, succeeded under a regency. At the age of 18 she assumed the government, at once concluded the war with Denmark and hastened the conclusion of the Thirty Years' War in Germany. She had the genius of her father but applied it to peace, and all his virtues and some of his faults. She patronized literature and philosophy, brought Descartes to Sweden and tried to bring order out of the chaos at home and abroad. Dissatisfied, she secured the election of her cousin Charles Gustavus as her successor, abdicated in 1654 and embraced the Roman Catholic faith. She settled in Rome, where she became the patroness of letters and science and collected a great library which was afterward incorporated with that of the Vatican.

The beginning of the century saw a series of contradictory movements begin. The Jesuits established their Reductions in Paraguay, where a solution of the social problems of life for savage peoples was probably best presented in history. About the same time the Romanoffs became tsars of Russia to continue absolutism until well on in the 20th century. In 1620 slavery was introduced by the sale of African negroes in Virginia and the Pilgrims landed on Plymouth Rock.

France became the dominant power in Europe during this century. This was largely due to the genius of Richelieu, but also to his almost complete disregard for any law, human or divine, that opposed his ambitions for his country. He intrigued with Protestants when that suited his purpose, was the champion of Catholicism on occasion, oppressed the nation at home and schemed abroad—the type of statesman praised because he put the state above every other consideration. He aimed to make the power of France supreme in Europe and to make the king absolute in France. By intrigue, by diplomacy, by every other means, he succeeded in these ambitious projects. He crushed the Huguenots, suppressed the aristocracy and wiped out the local assemblies and courts with their old privileges. He did not live to see France the leading power of Europe, but his policy carried out, proved successful in the hands of others. When Louis XIII died, his son Louis XIV was but five years of age. He reigned 68 years. It looked as though, under a child ruler, France might lose her prestige, but Cardinal Mazarin continued Richelieu's policies, loading France with the taxes that eventually brought the Revolution in its train, to do so. When Mazarin died, Louis at 23 at once took the government into his own hands. For more than 50 years he was his own Prime Minister and gave attention to every detail. He waged

four great wars, three of them in this century—that about the Spanish Netherlands (1657–68), that of the Protestant Netherlands (1672–78), that of the League of Augsburg (1688–97). He succeeded in extending his rule over certain Flemish towns, but his war with Holland proved a failure, the sturdy Dutch cutting the dikes, flooding their country, making the French army useless and driving the French fleet from the seas. Louis seized the free town of Strassburg (1681) without provocation and thus extended his kingdom to the Rhine. He revoked the Edict of Nantes which guaranteed religious freedom to the French Protestants, but only succeeded in depriving France of many worthy citizens, some of whom sought refuge in America to be sturdy upholders of liberty, and others in the Transvaal and the Orange Free State to be the backbone of independence there. A League of Nations was formed against Louis, embracing not only the Protestant countries, of England, Holland and Sweden, but also most of the Catholic powers of Europe, including Spain and the emperor. The war lasted 11 years. The French made important conquests but were unable to hold them and laid them waste. At the end of the war, all parties gave up the territory they had won, though Louis succeeded in retaining Strassburg.

The most interesting character of the century is Oliver Cromwell. The son of a simple country gentleman, educated at Cambridge, he was returned by his university to the Short and Long Parliaments. He became captain of a Parliamentary company of horse in 1642, and then colonel. He organized a regiment which, on account of its invincible courage, was known as the Ironsides. He was a prominent member of the High Court that signed the death warrant of Charles I. His position in the army gave him a controlling voice in the government, and after his expedition to Ireland (1649), he was made commander-in-chief. Later, defeating the Scotch (1651), and expelling the Rump Parliament, he was made Lord Protector of the Commonwealth (1653). He ruled practically alone. He was a benevolent autocrat who labored "to make England great and to make her worthy of greatness." His autocracy was tempered by his manifest desire to rule England in accordance with Scriptural precepts. He had the vindictiveness of the Old Testament deep in his character. His treatment of the Irish put an indelible stain on his memory. Over half a million of them were killed or banished. The best lands of the island were confiscated and granted to English and Scotch settlers. The famous Cromwellian settlement is called the "curse of Cromwell" by the Irish. Disaffection has existed ever since. As Lord Protector, Cromwell ruled firmly and secured the respect of foreign countries and peace and prosperity at home. He made England the leading Protestant country and interposed wherever Protestantism on the Continent needed an ally. He protected the Huguenots, won the Duke of Savoy to stop the persecution of the Vaudois and opposed the political policies of France and Spain except when they might favor Protestantism. Confident that the Pope was responsible for all opposition to Protestantism, he had him informed that unless there was peace, the sound of English guns would be heard in Rome. When he died unexpectedly of influenza (1658),

he was succeeded as Lord Protector by his son Richard, timid and without resolution, who yielded to the disaffection of the army and resigned his office the next year. Anarchy seemed in prospect, but General Monk, commander of the army in Scotland, took control and the Long Parliament restored the Stuarts in the person of the son of Charles I. Charles II was received with the heartiest of welcomes. His reign saw a long reaction against the gloomy Puritanism of the preceding generation, during which morality sank to a low ebb, the drama declined, women appeared as actresses and literature became a pander. England suffered severely from plague (1665) and the great fire in London (1666) wiped out most of the town but gave opportunity for reconstruction, with widened streets and created much more healthful conditions. Sir Christopher Wren was put in charge of the reconstruction and built a number of handsome buildings. Great dread existed lest Roman Catholics gain any power in England and the announcement of the discovery of a Popish plot (1678) to kill all Protestants, beginning with the king and Parliament, caused great excitement. Informers came forward to testify and Titus Oates particularly gained notoriety. Many Catholics, convicted on the testimony of perjured witnesses, were condemned. The revulsion of feeling over the injustice done led to the Habeas Corpus Act (1679) which has stood ever since as the safeguard of personal liberty all over the English-speaking world.

The hero of the century is John Sobieski, the brave king of Poland (1629-96). He had risen by merit to the command of the Polish army when Poland was the most important country in central Europe and had been especially successful against the Cossacks and Tartars, encroaching on the frontiers. Later, when the Turks invaded Poland, he won several battles from them and his crowning victory of Chocim cost them 20,000 men and many guns. He became a national hero and was unanimously elected king (1674). His reign was occupied in battling with the Turks. Finding it vain to attack the Poles, the Turks turned against Austria, laid siege to Vienna, from which the Emperor Leopold fled, after imploring Sobieski's help. In spite of political reasons to the contrary and Louis XIV's counsel against it, Sobieski at once went to the rescue and with an army of scarcely more than 75,000 men, defeated some 300,000 Turks and saved Vienna. The victory was largely due to the prestige of Sobieski's name, for the Turks stood their ground until they heard that "The Northern Lion" was on the field, when they lost courage and broke in confusion.

What has been called the political revolution of modern times begins after the peace of Westphalia (1648). For the next century and a half the seeds of political disaffection grew to reach fruition in the French Revolution (1789). The revolutionary spirit was fostered by the frequent wars of the time, so many of them undertaken merely for the benefit of particular reigning families, that the period has been called in history the "era of dynastic wars." The culmination of arbitrary power centred in one man was reached in Louis XIV of France, who may not have used the expression attributed to him often "L'État c'est moi —

I am the state," — but his career exemplified that motto. Since Henry VIII's time, the divine right of a monarch in England had become more explicit and was formally claimed by James I and the Stuarts after him. The second half of the 17th century brought with it the beginning of the reaction against this exaggeration of the place of royal authority and thoroughly prepared for the revolutionary movements of the next century.

With the beginning of this century, English America comes into history. The settlement of Jamestown, Virginia (1607); of the Pilgrims in Massachusetts (1620); of the Dutch in New York (1621); of the Swedes in New Jersey (1633); of Lord Baltimore and his colony in Maryland (1634) and of the Quakers in Pennsylvania (1681), are the important events of this period. All of the colonies suffered much from the Indians except Pennsylvania, where William Penn paid them for their land and always treated them fairly. Most of the colonies developed slowly but by the beginning of the 18th century, had begun to show some signs of the power they were to be. Unfortunately the colonists brought with them all the prejudices of their former European environment. Even those who had been driven from Europe by religious persecutions refused to permit religious liberty in America. Only the Quakers in Philadelphia allowed freedom of worship. As a result, Philadelphia, though latest founded and situated far from the sea, soon became the largest city of the colonies and the centre of their cultural and commercial life. Massachusetts grew very rapidly, receiving some 20,000 immigrants before the middle of the century, and Harvard College, the first collegiate institution in English America until the 18th century, was founded in 1638. The first book printed in the English colonies was the Massachusetts Bay Psalm Book (1639).

The great social worker of the century, the type of social reformer that was to come, is Vincent de Paul (b. 1576; d. 1660), perhaps the greatest benefactor of the poor that ever lived. Ordained priest at 25, he was captured by Turkish pirates shortly afterward and sold in Tunis as a slave. After two years, he escaped with his master, a renegade Christian, whom he brought back to his religion. After this experience, the one ambition of his life was to do good to those in need. The poor in the country places in France were sadly neglected — little better than slaves on the land. He organized missions and conferences of charity for their benefit. By his enthusiastic and yet thoroughly practical ways, he won to his aid a number of distinguished patrons. Then he took up the care of the convicts in the galleys. While on land, they were crowded, in chains, in damp dungeons, their only food black bread and water, and they were covered with vermin and ulcers. He went among them, bringing them food, medicines and, above all, human solace. Nothing was repulsive to him and he dressed the ugliest of wounds. He began his work in Paris and when it attracted the attention of the king, Louis XIII, and he was appointed Royal Almoner, he took advantage of the position to visit Marseilles and Bordeaux. In each place a hospital was erected for the convicts. Their moral regeneration was even more his care than their physical improvement. He recognized the

need of special training for the assistants in such social work for the missions and charities, and so he established an association for this purpose. He gathered around him as an auxiliary a number of ladies of the nobility of France, organized as the Ladies of Charity. Through them he collected immense sums of money which were distributed to the poor. Foundling children were his special care, particularly after he discovered that sometimes they were deliberately deformed by scoundrels who thus appealed to public pity. The municipal asylum for foundlings was little better than a place for them to die. The 17th century was a time of war, with poverty rife, and the children suffering above all, so Vincent next organized the Daughters of Charity, young women who were willing to devote their lives to social service. This foundation still exists as the well-known Sisters of Charity, all over the world. Poverty became so bitter that Vincent had to organize for the shelter and employment of some 40,000 unemployed near and around Paris. His reputation and prestige enabled him to get the needed help. The king granted the lands of the Salpêtrière for a hospital and lodgings. In what is known as the French Period of the Thirty Years' War, the war zone, as in our own time, was in Lorraine, Franche-Comté and Champagne, around Metz, Toul and Verdun, for nearly 25 years. Vincent came to the assistance of the poor people there, secured hundreds of thousands of dollars at a time when money was worth five or six times as much as now. He established a periodical, *Le Magasin Charitable*, in order to publish accounts of what was done, to call attention to special needs, and touch the hearts of others by letters received from those helped. He founded a series of public kitchens to feed the poor, and also to instruct them how to prepare their food economically and advantageously. He himself gave minute instructions as to the quantity of fat, butter, vegetables and bread people should use and the mode of preparing the soup. He founded societies to bury the dead and clear away dirt to prevent disease. These were under the Sisters of Charity. He distributed seeds so that the war-stricken people might prepare their harvest. The triumph of his charity is the foundation of a special organization for the relief of the impoverished nobility. In the midst of all this work, he lived to be 85 years of age and wrote some 30,000 important letters, all of them without exception for some good purpose for others.

JAMES J. WALSH,

Author of *'The Thirteenth, Greatest of Centuries.'*

PRINCIPAL EVENTS OF THE SEVENTEENTH CENTURY.

- 1603. Queen Elizabeth of England dies. Union of Scotland and England under James I.
- 1605. The English gunpowder plot.
- 1607. Hudson's Bay discovered by Hendrik Hudson.
- 1608. Galileo with a telescope observes the satellites of Jupiter.
- 1610. Assassination of Henry IV, king of France.
- 1614. Logarithms invented by Napier.
- 1618. Manchus invade China.
- 1619. Harvey discovers the circulation of the blood.
- 1620. Voyage of the *Mayflower*. The Pilgrims land at Plymouth Rock. Slavery introduced in Virginia.
- 1625. Charles I of England begins to reign.
- 1627. Siege of Rochelle. Torricelli invents the barometer. Drabellius invents the thermometer.

- 1629. Cardinal Richelieu becomes Prime Minister of France.
- 1631. Battle of Leipzig.
- 1632. Death of Gustavus Adolphus at the battle of Lützen.
- 1641. The Irish rebellion and massacre of Protestants.
- 1642. Civil war begins in England. Battle of Edgehill.
- 1643. Louis XIV of France begins to reign. Wars of the Fronde.
- 1644. Cromwell's victory at Marston Moor over the English royalist forces. The Chinese Ming dynasty overthrown and the Manchu rule established.
- 1645. Complete defeat at Naseby of King Charles of England.
- 1648. End of Thirty Years' War.
- 1649. Charles I of England beheaded.
- 1653. Cromwell becomes lord protector of England.
- 1660. The English restoration. Charles II becomes king of Great Britain. Death of the great social reformer of the century, Vincent de Paul.
- 1665. The great plague of London in which 68,000 persons died.
- 1666. The great fire of London which in three days destroyed 13,000 houses.
- 1667. French invade the Netherlands.
- 1668. The peace of Aix-la-Chapelle.
- 1678. The habeas corpus act passed in England.
- 1683. The Turks capture Vienna.
- 1685. James II becomes king of Great Britain. The Newtonian philosophy first published. Revocation of the edict of Nantes.
- 1688. War of the Spanish succession. Revolution in Great Britain. James II abdicates.
- 1689. Peter the Great becomes tsar of Russia. William and Mary crowned rulers of Great Britain.
- 1690. The Battle of the Boyne.
- 1692. The Massacre of Glencoe.
- 1697. Charles XII becomes king of Sweden. The peace of Ryswick.
- 1700. The grandson of Louis XIV of France succeeds to the Spanish throne.

SEVENTH CENTURY. The outstanding events of this century centre around the rise of Mohammedanism or Islam (submission to God). From a small town in Arabia it spread over Asia to the Indus, through northern Africa, then to Spain and across the Pyrenees into southern France within a century. Mohammed, born at Mecca in Arabia, was a camel driver. He was a young man who was brought in contact with many different peoples, and earlier had been a watcher of flocks by night when men are tempted to think deeply about the relations of man to the universe. The Arabs and the Hebrews are the two most important branches of the Semitic race, to whom the world owes so much of thought with regard to religion. Mohammed passed through a series of mental struggles, and though unable to read and write declared that the angel Gabriel came to him in sleep and made a series of revelations so that he thought of himself as a messenger of God. These revelations became the Koran. He lived in retirement, teaching, but making few disciples especially in Mecca, though his doctrines were carried to Medina where they attracted a number of converts. The Meccans, fearing that his new teaching would disturb popular feeling toward their Holy City where was the Kaaba (the cube stone around which centred the idolatrous worship of the Arabs), rose against him and he fled to Medina. This flight (622) *hegira* (Arabic) was adopted as the beginning of a new era from which Mohammedan history still reckons. At Mecca, Mohammed had only preached, but at Medina he became a ruler and lawgiver. After a time he led his troops to the capture of Mecca, and Islam as a conquering religious empire began its history. Ten years after the *hegira* Mohammed died, but his teaching and the kingdom which he had founded lived on. At first his doctrines were scarcely more than Judaism with a slight admixture of Christianity adapted for the Arabs. His first disciples were

instructed to turn toward Jerusalem to pray, but later Mecca was substituted, and Judaism and Mohammedanism definitely parted.

The spread of Mohammedanism is a mystery until it is realized that it represents the religious motives which animated a series of barbarous tribes in their national efflorescence. The Arabians discovered their power just when the Roman Empire was reaching a depth of decadence that made it a ready victim. Mohammed taught that man's life was fated, predestined to good or evil from all eternity, but that death for the cause of Mohammedanism was an assurance of heaven. Fanatic fatalism made indomitable warriors of the Arabs and a series of commanders arose who led armies in all directions that soon gave wide extension to Mohammedanism. The interior of Arabia was conquered, and the whole Arab nation united in six years, Syria was overcome and all the Byzantine Greeks, Damascus was taken and the victory of Yermuk in Palestine completed the conquest (636). Jerusalem opened its gates to the Caliph Omar, and finally Antioch, the great capital of Syria, surrendered (638). The army directed toward Mesopotamia was equally successful. Persia was defeated in a great battle at Kadesia which lasted three days and in which 150,000 Persian soldiers were overcome by 30,000 Arabs. Ctesiphon fell into their hands, Ispahan was captured and Persepolis sacked, and by the middle of the 7th century Khorasaan became subject to the Arabs. Egypt suffered the same fate. Alexandria was seized about 646, and clever advantage was taken of the disaffection on the part of the Copts, or natives, toward their Greek rulers whom they considered foreigners and heretics. Amru or Amer, the Arab general in command in Egypt, proved himself a statesman as well as a leader of armies, and as he gave the country a much better rule than it had had under the Eastern Empire, he won the people. The story that either he or the Caliph Omar ordered that the great library at Alexandria should be burned is probably without foundation. Amru proposed to connect the Nile and the Red Sea by canal but the project was abandoned for fear of opening to the unbelievers a way to the sacred cities of Arabia.

In spite of divisions among the rulers, the spread of Mohammedanism continued under the Ommiads, the first of whom, who became ruler in 661, was Moawiyah, the descendant of Omayya, founder of a well-known Arab family. The Ommiads succeeded Ali, Mohammed's son-in-law, the husband of his daughter Fatima, and occupied the throne for some 90 years until 750 A.D. The last of these Ommiads escaped to Spain and founded the Caliphate of Cordova, where the family ruled for nearly 300 years. Under the Ommiads, Damascus became the capital of the Mussulman Empire. By 672 their power had become so firmly fixed that they attacked even Constantinople itself by land and sea, and the capital of the Greek Empire was only saved by the use of Greek fire, an invention of a Syrian, which caused havoc among the wooden vessels of the Mohammedans because water would not quench it but actually caused it to burn more fiercely. Having spread over northern Africa, the Mohammedans were ready at the beginning of the 8th century to cross over into Spain and to begin the series

of attacks on civilization from the West which so often put it to the hazard. The followers of the religion of the camel driver of Mecca threatened at one time to overrun and rule the world. Their war cry, "God is God and Mohammed is His Prophet," came to be the terror of Christians everywhere. Mohammedan pirates made the Mediterranean itself, and even many of the larger coast cities, places of terror because of their rage. The contradictions in the Koran, the emphasis on the sensual rewards that the faithful were to enjoy in the hereafter, the denial of the moral freedom of man, all these did not prevent the spread of the doctrine.

The Mohammedans were in close touch with the Grecian culture in the Eastern countries, and as ever in history "captive Greece led its captor captive." The Saracens, children of the desert as they called themselves, were in the course of two generations of close contact with the Greek cities of Asia Minor, deeply influenced and reached a stage of high intellectual development. They often were more highly civilized in the intellectual sense of the term than the Germanic conquerors of the Roman Empire with whom they came in contact in the West. For some centuries the Arabs carried on the Greek tradition and represented the highest culture in the world. They accomplished little that was progressive, though the 'Arabian Nights' and some of their poetry are eminently original contributions to world literature. The Arabs by a curious contradiction consonant, however, with their Semitic character, possessed the two opposite qualities, the mystic and the practical. They accomplished much more in science than in literature. The number of words of Arabic origin used in the sciences demonstrate this. Alchemy, alcohol, alembic, algebra, almanac are but a few examples in "a." They had the advantage of close touch with the work of the Greeks in science, and this enabled them to out-distance the Western Europeans. Their great cities—Bagdad, Cairo and Cordova—were centres of learning as well as of world commerce. They developed an attractive style of architecture and were the intellectual leaders of mankind in the mid-mediæval period. They added much less to what they had learned from the Greeks than has been thought, and their reputation for great advances in medicine and surgery has been rudely disturbed by modern studies in medical history. Their religious prejudices hampered the development of anatomy and of surgery, and their oriental tendencies led to unfortunate polypharmacy. Arabian physicians developed what, from the number of ingredients, came to be known as *calendar* prescriptions. Modern medicine had its real beginning when Arabic influence declined and when Græcisms and not Arabisms are to be found in the medical writers.

The intellectual light of the century in the West is Isidore (560-636), who became archbishop of Seville 599. His influence was far-reaching. He presided over the Fourth Council of Toledo (633) and to him are attributed most of its decrees. All bishops were required to establish seminaries, the study of Greek and Hebrew as well as the liberal arts was prescribed, and interest in law and medicine encouraged. The Arabs are usually set down as

introducing Aristotle into Spain, but Isidore had done that long before. He wrote the first *summa* of knowledge, and his work was used as a textbook during most of the Middle Ages, and was printed no less than 10 times between 1470 and 1529, some thousand years after his time. It contains information almost in the same form as the modern encyclopedia. There is much more insistence on religious questions than in our time. Isidore quotes 154 authors, Christian and pagan. His information is well ordered, so that no wonder it attracted attention. Many editions of portions of the work were issued in the 19th century. Mommsen edited the historical writings of Saint Isidore among the 'German Monuments of History' (Berlin 1894). The eighth Council of Toledo showed its critical appreciation by declaring him "the extraordinary doctor, the latest ornament of the Church, the most learned man of the latter ages, always to be named with reverence." Isidore's works are the touchstone by which the human interests of this century may be judged.

A great educator of the time was Columbanus, the Irish abbot of Bobbio in Italy, who died there in 615. At the end of the 6th century he had come over to France (probably 585) with 12 companions, three of whom, Saint Attala, Saint Gall and Columbanus the Younger are well known in history. He established the celebrated abbey of Luxeuil, after having founded the abbey of Annegray in the Vosges, but even two monasteries did not suffice for the numbers who came to join him and a third had to be established at Fountains. He deprecated the conduct of Queen Brunhilde, who strove to counteract his influence by introducing religious elements into their differences. The question of the Celtic observance of Easter and of the Celtic, that is the anterior instead of the poll tonsure was brought up. To avoid contention that might give scandal, Columbanus thought it better to leave France for Italy. On his way he left Saint Gall to found the monastery called after him in Switzerland, while he himself, having been given by the king of the Lombardi a tract of land known as Bobbio between Milan and Genoa, erected early in the 7th century the celebrated abbey which for centuries was a stronghold of orthodoxy in northern Italy.

The beginning of the century saw the climax and sad end of the career of a great woman, Brunhilde or Brunehaut (the brunette), daughter of Athanagild, king of the Visigoths, who married Sigebert, king of Austrasia (561). She was intensely ambitious, both for her husband and herself, and of indomitable energy. She did great good by introducing the principles of Roman law which had ruled at the court of her father among the Austrasians. Unfortunately her ambition incited a series of wars between her husband and his brother, in the midst of which her husband was treacherously killed. She became regent for her minor son, but her reign was the beginning of the downfall of the Merovingian dynasty, for mayors of the palace are now mentioned for the first time as exercising power, and the growth of their influence in succeeding reigns finally brought about an end of the ruling house toward the end of the century. Brunhilde was learned as well as ambitious, and deeply intent on securing for her people all the benefits of civilization. She ruled over two-thirds of Gaul

better perhaps than it had ever been governed before. She had roads constructed to facilitate intercourse and commerce, was a patroness of education and the arts, and destroyed whatever remained of idolatry among the people. She built a number of monasteries, partly for educational reasons and partly for the facilities they provided for the solution of social problems in country places. To her is attributed the foundation of one of the very early French hospitals at Hautonne. Dagobert, in the first half of the 7th century, is said to have founded a hospital in Paris. Haeser places the foundation of the Hotel Dieu shortly after the middle of this century. Brunhilde's ambition, however, finally overreached itself and brought her to an ignominious fall. Pope Gregory I, the Great, had written to congratulate her on all that she was doing for Christian civilization, but when she endeavored to maintain her position as ruler by encouraging her grandson in licentiousness so that she might have more power over him, Saint Columbanus reproached her with it, and though he was driven from his monastery of Luxeuil on pretense of heretical tendencies, the clergy became exasperated, and finally the whole kingdom became disaffected, and offered to recognize Lothair II, if he would relieve them of Brunhilde's rule. He marched against her and she was abandoned by her army on the banks of the Aisne where with her four grandsons she fell into the hands of Lothair, who had the four princes put to death and bound Brunhilde at the age of 80 to the tail of a wild horse who dashed her to pieces as he ran away (613).

The climax of Merovingian power was reached in the reign of Dagobert I (602-638), who secured the Franks a preponderance in western Europe. Dagobert put down the Wends, organized the Saxons to resist the encroachment of the Slavs on Thuringia and delivered Bavaria from the Bulgarians who were ravaging that country. Finally he became the master of practically all Gaul, and strengthened his position as ruler by restraining the nobles, preventing abuses and violence, and going through the country to give audience to great and small. He improved the laws, favored commerce at home and abroad, formed an alliance with the Lombards of Italy and the Visigoths of Spain and sent ambassadors to Heraclius the Eastern Emperor. He encouraged art and the arts and crafts, and some of the jewelry of the Merovingian times recently excavated show us how high was the taste of the period.

The great master in the industrial arts was the famous Saint Eloi or Eligius (588-659) who was a goldsmith but afterward became the bishop of Noyon. He was a favorite of Dagobert, who went to him for counsel in the foundation of churches and monasteries and in the distribution of alms to the poor. Around Saint Eligius' name a 19th century controversy developed because Mosheim, the German church historian (18th century), had quoted from one of his sermons expressions which seemed to indicate that the essence of Christianity at that time consisted in the paying of church fees. As a matter of fact, the sermon from which the quotation was taken shows that Saint Eligius insisted on all the highest virtues of Christianity. He is himself a fine type of the sincere church-

man, devoting himself and all his faculties to the benefit of Christianity.

The great struggle in France between the kings and the higher nobility, which was to continue for so many centuries to hamper national progress, may be traced in its beginnings to this time. The question of the limitation of land grants to the length of the life of the grantee so that each king on his accession might revoke such grants except on assurance of the continued loyalty of the possessors of the land, was one of the factors which made for the establishment of feudalism somewhat later in history, though its earliest manifestations can be noted at this time. The weakness of the Merovingian monarchs only complicated the problem and gave the nobles opportunity to entrench themselves in their possessions.

The great ruler of this century is Heraclius, the Eastern Emperor (575-641). He was the son of Heraclius, governor of Africa, and succeeded to the imperial throne through a conspiracy between his father and Crispus, the son-in-law of the Emperor Phocas. He proved for many years just the ruler that was needed for the Eastern empire. Under Justinian the armies of that emperor had succeeded in reconquering Italy and Africa, and re-establishing the empire in something of its old-time prestige. Barbarous nations had been encroaching more and more on the frontiers of the empire, and the Avars from the North and the Persians made serious inroads. Heraclius set up the Croats and Serbs in Illyricum as a barrier against the Avars, but he himself led his armies against the Persians, and after many strenuous campaigns in the third decade of the century he annihilated Persian power and re-established the Imperial dominion. This hard task had only just been completed, however, when the Mohammedans began their inroads, and Heraclius had to see his recent Eastern conquests fall under the dominion of this new power in the East, which was to prove so serious an enemy to the Eastern empire and finally bring about its fall.

All during this century the existence of the Exarchate of Ravenna (instituted 568, ended by the Lombards 752) acted as a conservative element in Western civilization. The beautiful architecture and interior decoration of the churches and palaces in Ravenna preserved a taste for the beautiful and an appreciation of art. Its presence kept alive the imperial idea and principle in the minds of Westerners who would probably have lost sight of it if they had only Constantinople in the East to think of. It conserved the idea of a Roman empire and so prepared the way for Charlemagne's dominion and for the feeling of solidarity to some extent among the Western nations. The presence of the Exarch at Vienna accomplished much for peace in Italy and gave some opportunity at least for the cultivation of the arts of civilization instead of utter devotion to the art of war. Under a great ruler like Heraclius the influence of the Greek or Byzantine empire in the West was deeply felt. The maintenance of a strong Greek imperial outpost at Ravenna warded off to a great extent the Slavic races of eastern Europe from invading the South until Christianity had come to modify in some respects their barbarism.

Two immortal names are associated with the abbey of Whitby as it has come to be known, though its original name was Streonshalh (Saxon), founded in this century. (The existing remains date from the 12th century). Hilda or Hild, the abbess, and Cædmon, the poet, were here in the second half of the century. Hilda (614-680) is noteworthy as the foundress and, after the Celtic tradition, the head of a monastery in which there were both men and women. She was of royal descent and had been abbess of Hartlepool (649). Cædmon was a stableman at Whitby, who, ashamed of the fact that he could not respond to the request for a song which was customary at the abbey dinners on high festival days—the custom of thus entertaining themselves at this time is noteworthy—retired to the stable and there was commanded in a dream “to sing the beginning of created things” (Bede). In the morning he remembered his dream and his poetical gift was fostered by Hilda until he produced his great poem of ‘Creation,’ a metrical paraphrase of the Old Testament, the first monument of English literature. It is said to have influenced Milton deeply. Another great abbey, that of Glastonbury, was re-founded in this century. It became a centre of the intellectual and spiritual life of the time. Around it gathered the legends of the visit of Joseph of Arimathea to England, whose staff planted became the famous Glastonbury thorn which blooms every Christmas eve, as well as of the legends connected with King Arthur who is supposed to be buried here on the Isle of Avalon (Isle of Souls or Land of the Blessed). Glastonbury and Whitby continued to be important religious and educational institutions until the time of Henry VIII. There are very old traditions which would place the foundations of Cambridge and Oxford in this century, especially the former, and while false in formal fact, there is an element of truth in them because of the great interest which this century evinced in educational foundations of various kinds and which seems to have touched also the immediate neighborhoods where are now the great English universities.

JAMES J. WALSH,

Author of 'The Thirteenth Greatest of Centuries.'

PRINCIPAL EVENTS OF THE SEVENTH CENTURY.

- 602. Dagobert began his reign in western Europe.
- 610. Mohammed began to preach at Mecca.
- 613. Brunehilde, queen of Austrasia, was brutally put to death by Lothair II.
- 614. Persians captured Damascus and Jerusalem.
- 626. Persians besieged Constantinople.
- 627. Li-Chimin, son of the founder of the Tang dynasty, ascended the throne of China and assumed the name of T'ai-ning.
- 631. Nestorian Christian missionaries visited China.
- 632. Death of Mohammed.
- 634. The Arabs occupied Damascus.
- 636. The victory of Yermuk completed the Arab conquest of Syria.
- 637. Jerusalem surrendered to the Arabs.
- 638. Persian power was overthrown at the battle of Kadesia.
- 639. The Arabs invaded Egypt.
- 641. Death of Heraclius, the Eastern Emperor.
- 643. Theodosius, emperor of Constantinople, and the king of Persia, sent envoys to the emperor of China with gifts of rubies and emeralds. Chinese civilization reached its climax.
- 646. Arabs captured and occupied Alexandria.
- 672. Arabs began a seven years' siege of Constantinople. Their first attacks were foiled by Greek fire which destroyed their ships.
- 680. Cædmon, the Anglo-Saxon poet-author of the ‘Creation,’ died.
- 692. Arabs destroyed Carthage.

SEVENTH DAY BAPTISTS. See BAPTISTS, SEVENTH DAY.

SEVERINUS, sêv-êr-ê'nûs, Saint, the Apostle of Norica: b. either in northern Africa or southern Italy; d. Jan. 482. After the death of Attila in the 5th century he journeyed through the territory along the Danube, preaching Christianity, and through his courage and good work gained great influence over the people and made many converts. After his death his body was taken into Italy by Lucillus, one of his followers, and found its final resting place on a small island near Naples.

SEVERN, sêv'ern, Joseph, English artist: b. Hoxton, 7 Dec. 1793; d. Rome, Italy, 3 Aug. 1879. He was self-taught and won, after great struggles, the Royal Academy historical painting prize in 1818. Early in life he formed a friendship for the poet Keats, for which he is chiefly noted; in 1820 accompanying the poet to Italy, and caring for him there until Keats' death the following year. He painted several portraits of Keats. In 1821 Severn exhibited 'The Death of Alcibiades' at the Royal Academy and won a traveling pension. He subsequently served as British and as Italian consul at Rome, where he lived until his death, devoting his time chiefly to the painting of miniatures. He wrote some, but his literary work is of no importance. He was buried near his poet-friend. His best-known pictures are the 'Roman Beggar'; 'Specter Ship,' and his work on the altar of Saint Paul's Church, Rome. Consult Sharp, 'Life, Friendships and Letters of Joseph Severn' (1892).

SEVERN, England, the second river in size and most important in the country, rises at Maes Hafren in Montgomery County, and after a winding course of about 200 miles falls into the Bristol Channel. The Vyrnwy enters the Severn on the Shropshire borders, the Wye, below Chepstow and the Lower Avon about eight miles below Bristol. At Welshpool the Severn begins to be navigable, about 178 miles above its mouth. Near Gloucester it branches forming the Isle of Alney. It is a great tidal river, with a remarkable ebb or bore; vessels of 400 tons can ascend as far as Worcester. Below Gloucester navigation is impeded, and its low banks at this point cause frequent inundations. A railway tunnel (four and one-half miles) passes under the estuary near the Wye.

SEVERO, sâ-vâ'rô, or **NORTHEAST CAPE.** See CHELYUSKIN, CAPE.

SEVERUS, sê-vê'rûs, Alexander. See ALEXANDER SEVERUS.

SEVERUS, Lucius Septimius, Roman emperor: b. near Leptis, Magna, Africa, 146 A.D.; d. York, Britain, 211 A.D. After the murder of Pertinax, in March 193 he was proclaimed emperor by his troops at Carnuntum. Thereupon he marched to Rome to crush the partisans of Didius Julianus, who had meanwhile purchased the imperial purple from the Prætorians. On his approach Julian was deserted and assassinated by his own soldiers. In professing that he had assumed the purple only to revenge the death of the virtuous Pertinax, Severus gained many adherents and was enabled to banish the Prætorians. But while he was victorious at Rome, Pescennius Niger was in the East at

the head of a powerful army, by which he also had been called to the purple. Getting rid of the rivalry of Albinus by conferring upon him the title of Cæsar, Severus at once directed his arms against this eastern competitor. On the plains of Issus, Niger was totally ruined by the loss of 20,000 men (194). After devastating some territory beyond the Euphrates, Severus took Byzantium, which had shut her gates against him, but only after a protracted siege (196); and he then returned to Rome, resolved to destroy Albinus. He attempted to assassinate him by his emissaries, but when this failed, Severus had recourse to arms, and defeated Albinus near Lyons (197). After returning to Rome Severus marched into the East to repel an invasion of the Parthians; made himself master of Seleucia, Babylon and Ctesiphon, and advanced far into the Parthian territories. From Parthia he marched toward the more southern provinces of Asia and entered Alexandria. A rebellion in northern Britain called him away again in 208. After penetrating to the far north of Caledonia, and losing a vast number of men, he returned southward and rebuilt or repaired the wall of Hadrian across the island from the Tyne to the Solway Firth. The jurist, Papirianus, flourished during his reign and introduced improvements in the administration of justice. Consult Platnauer, M., 'The Life and Reign of the Emperor Lucius Septimius Severus' (Oxford 1918).

SEVERUS, Wall of. See HADRIAN'S WALL.

SEVIER, sê-vêr', John, American pioneer: b. Rockingham County, Va., 23 Sept. 1745; d. near Fort Decatur, Ga., 24 Sept. 1815. Having founded the town of Newmarket, Shenandoah County, Va., and there become a celebrated Indian fighter, he served as captain in the Virginia line during Lord Dunmore's War (1774; see COLONIAL WARS IN AMERICA). He had removed in 1772 to the Watauga colony on the western slope of the Alleghenies and been, next to John Robertson (q.v.), the most prominent of the settlers. Now, at the beginning of the Revolution, he drafted a memorial to the legislature of North Carolina, requesting annexation to that colony, and as a result all of the present Tennessee was made a county of North Carolina and known as Washington district. He served in the North Carolina legislature and was appointed district judge at Watauga. Elected colonel of the trans-Alleghany forces, he commanded in many Indian fights, distinguishing himself at Boyd's Creek (1779) and King's Mountain (1780). After the war, North Carolina found that the retention of the large section now known as Tennessee would entail obligations for a corresponding portion of the Federal debt and, therefore, the tract was made over to the central government. The settlers then determined to organize an independent State and regularly apply for admission to the Union. At a convention held 23 Aug. 1784 Sevier was elected governor of the new State of Franklin, as it was called. North Carolina now recognized its mistake and granted Watauga a Superior Court, besides organizing the militia troops into a brigade with Sevier as brigadier. But Sevier entered office as governor 1 March 1785, reorganized the military, established a Superior Court and con-

cluded treaties with the Cherokees. In 1787 Governor Caswall of North Carolina declared the Franklin government a revolt, subdued it by force of arms, imprisoned Sevier and ceded the region to the Federal government. Sevier was afterward made brigadier-general of forces in the territory south of the Ohio, in 1790 elected as first representative of Congress from the Mississippi Valley, and in 1796 was elected governor of the new State of Tennessee, serving three successive terms. In 1803 he was re-elected and again served three terms consecutively. He was chosen to Congress in 1811 and returned for a third term. Consult Gilmore, 'Rear-Guard of the Revolution,' and 'Life' (1887).
